Housing, Town Planning, etc., Bill.—The president opened a discussion on this Bill, and made official reference to the clause therein providing for a quinquennial survey and registry of all property under £26 annual value in towns of 50,000 inhabitants and upwards, and under £16 annual value in districts under that population, and to the injustice which such a clause if passed would inflict upon owners of property. Councillor Spink, Mr. Henry Fallas, Mr. E. A. Elvey, Mr. G. Crook, Mr. J. Pashley, Mr. J. W. Sanderson entered into the discussion, and endorsed the views of the president on the question.

Wages Board.—The proposals of the Government to deal with the evils of sweating, etc., by way of a wages board were also considered, and the feeling of the members was that trades which were properly organised like the building trade should be exempted from such proposals.

New Members.—On the proposition of Mr. Elvey, seconded by Mr. Crook, Messrs. Bagnall Bros., of East Moor, Wakefield, builders and contractors, were elected members of the association; and on the proposition of Mr. Pashley, seconded by Mr. Fallas, Messrs. J. Kitson and Sons, of Denby Dale, were elected honorary members.

LEEDS ASSOCIATION.

Secretary: J. Davidson.

The monthly meeting of the Leeds Association was held on Tuesday, February 9th. Mr. Wm. Irwin (president) was in the chair, and a large number of members were present. The minutes of the Yorkshire Federation were read and considered.

The president and the secretary reported upon the National Federation meetings recently held in London, and gave a résumé of the important business transacted.

On the invitation of the Leeds and Yorkshire Architectural Society, a meeting has been arranged to discuss the question of "The Preparation of Plans by Builders."

In view of the termination of the lease of the Leeds Builders' Exchange, a committee was appointed to consider the offers of rooms suitable for the meetings of the Association, and to report in due course.

Three applications were received for admission as associate members, and these were formally approved.

PORTSMOUTH ASSOCIATION.

Secretary: F. B. Roskell.

The thirty-sixth annual meeting of the Portsmouth and District Master Builders' and Building Trades' Association was held at the Sussex Hotel, on Tuesday evening, February 9th. Mr. M. Coltherup, the retiring president, occupied the chair at the commencement, and presided over a large attendance.

The annual report and balance-sheet, which were very satisfactory, having been received and adopted, Mr. Chamberlain, in proposing the election of Mr. Davies as president for the ensuing year, spoke in high terms of that gentleman's fitness to occupy the position.—Mr. Evans seconded the resolution, which was carried unanimously.—Mr. Davis, on taking the chair, briefly thanked the members for the honour conferred upon him.—A hearty vote of thanks was then accorded to the retiring president, who, in reply, thanked the committee and members for their kind co-operation during his term of office.—Mr. J. Harding and A. E. Porter, T.C., were then unanimously elected as senior and junior vice-presidents respectively, and Mr. J. Crockerell as treasurer. The following gentlemen were elected on the committee:—Messrs. M Coltherup, S. Salter, G. R. Chamberlain, W. J. Light, T.C., W. W. Evans, W. P. Wigmore, J. W Perkins, T.C., S. E. Sprigings, T.C., J. Durrant, Frank Aylen, W. H. Sabine, and C M. Dash (Gosport). A vote of thanks to the retiring auditors having been passed, Messrs. W. A. Carline and S. L. Norman were unanimously elected to act in that capacity for the ensuing year.

Several business matters were discussed.

In the 36th annual report of the committee, it is recalled that at the commencement of the year tenders were invited by the corporation for "emergency staircases" for the local Council schools without quantities being supplied, but following a letter of protest from the committee, fresh tenders were invited, quantities then being supplied.

In view of the proposed regulations contained in the report of the Departmental Committee appointed to inquire into the dangers attendant upon building operations, a resolution was passed by this association endorsing the efforts of the National Federation of Building Trade Employers in their recent appeal to the Home Office to have an opportunity of representing their views more fully by means of a deputation, and directed that a copy of the resolution be forwarded to the Home Secretary.

As a consequence of representations made by the speculative builders of Portsmouth with regard to new by-laws governing the trade, a joint conference was arranged by a committee representing both sides to discuss the matter. Subsequently a report was drawn up and submitted to the Roads and Works Committee, giving the views of the Master Builders' Association and the speculative builders, and asking for certain amendments, there being, in their opinion, reasonable grounds for same. It is understood that the question is receiving due consideration.

With regard to the recent action of the corporation in again inviting tenders without supplying quantities—this time for the proposed refuse destructor—the committee at once forwarded a letter protesting against their action, and requesting that quantities should be supplied. In this case, however, the protest was unsuccessful, as it was considered to be special work, for which quantities could not be prepared.

The committee draw attention to the fact that the BUILDERS' JOURNAL, of Caxton House, Westminster, is now the official organ of the National Federation, and urge upon members the duty of supporting it.

The association is still increasing in strength and numbers, and ten new members were elected last year.

The subscriptions during the year have been promptly paid, there being an increase on last year's subscription of £12 10s., and the balance-sheet shows a very satisfactory state of affairs.

Practical Notes for Architectural Draughtsmen.

By ALFRED W. S. CROSS, M.A., F.R.I.B.A.
and ALAN MUNBY, M.A., A.R.I.B.A.

Complete Set Now Ready (27 Large Plates in a Portfolio), 12s.

POST FREE, 12s. 6d.

Prof. C. H. REILLY, of Liverpool University, says: "I think it is a very valuable book, and I hope it will find its way into most architectural offices."

THE "PRACTICAL NOTES" gives in most convenient form for use on the drawing board examples with concise rules, explanations and dimensions for preparing Designs, Perspectives and Working Drawings for Classical Architecture with rapidity and precision.

STUDENTS preparing for the examinations of the R.I.B.A. can learn how to draw The Orders correctly with the smallest possible amount of study and work by utilising the invaluable drawings and data given in this publication.

We shall be pleased to forward a copy of this work on approval to any of our subscribers.

"LIMPET" PATENT BOLTS & WASHERS

FOR CORRUGATED IRON SHEETS.

"There is no doubt in our mind that they ought to be regularly specified where iron sheeting is used."—*Vide* BUILDERS' JOURNAL.

Their great feature is the way in which they adjust themselves to the corrugation and make an **absolutely watertight joint.** They also retard the corrosive action in Galvanized Sheets and combine other advantages.

EXCLUSIVELY ADOPTED BY THE INDIAN GOVERNMENT, THE LEADING RAILWAYS AND MANY OF THE LARGEST MANUFACTURING CONCERNS IN ENGLAND AND THE COLONIES.

PRICE'S PATENT

The latest and most approved Fixing for joining Corrugated Iron Sheeting together.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Feb. 26. TREALAW.—Erection of a retaining wall at Baithweunydd Road, for the Rhondda U.D.C. Plans and specification, and forms of tender, at the public offices, Pentre, on deposit of one guinea. Tenders, endorsed "Tender for Retaining Wall," by 10 a.m. on Feb. 26, to the chairman of the council, public offices, Pentre; fair wages clause.

Feb. 26. LIVERPOOL.—Execution of drainer, bricklayer, ironfounder, joiner, plumber, painter, glazier, patent glazing, plasterer, tiler, heating and ventilating, electric lighting, lifts, ornamental metalwork, marble mason, metal window casements, and sanitary fittings, works at New Chief Offices, for the Royal Liver Friendly Society, Liverpool. Names to W. Aubrey Thomas, architect, 14, Dale Street, Liverpool, by Feb. 26.

Feb. 27. BRIDGEND.—Erection of a nursery block at the cottage homes, for the guardians of the union. Plans, etc., and all particulars, at the office of P. J. Thomas, architect, Bridgend. Tenders, endorsed "Nursery," by Feb. 27, to R. Harmar Cox, clerk, union offices, Bridgend.

March 1. SOUTHAMPTON.—Erection of an additional classroom for 60 children and two cloakrooms at Butlock's Heath council school, for the C.C. Apply at the office of W. J. Taylor, county surveyor, the Castle, Winchester. Tenders, by 10 a.m., on March 1, to H. Barber, clerk to the C.C., the Castle, Winchester.

March 1. BOLTON-UPON-DEARNE. — Erection of walls, etc., Recreation Ground, Goldthorpe, for the U.D.C. Specifications, bill of quantities, etc., of the surveyor at his office, between 10 a.m. and 4 p.m., upon deposit of 10s. 6d. Tenders, endorsed "Wall," by March 1, to J. Ledger Hawksworth, clerk, council offices, Station Road, Bolton-upon-Dearne, Rotherham.

March 1. TREGARE (MON.).—Erection of a new vicarage for the parish of Tregare, near Raglan, for the Rev. William Evans. Plans and specification at Hereford, or at the vicarage. Bills of quantities and form of tender, from Ernest G. Davies, M.S.A., architect, 132, Widemarsh Street, Hereford, and at Monmouth, on deposit of £1 1s. Tenders to the vicar, first post on morning of March 1.

March 1. PONTYPRIDD.—Erection of 20 houses or more at Pwllgwaun, Pontypridd, for the Llwynmadoc Building Club. Plans and specifications, and form of tender, on application to Edward Rees, architect and surveyor, Alexandra Chambers, Pontypridd. Tenders, endorsed "Llwynmadoc Building Club," by March 1, to J. W. Kinsman, A.C.A., secretary, Alexandra Buildings, Pontypridd.

March 2. STORNOWAY.—Erection of spire for church, for Deacons' Court of United Free English Church, Stornoway. Apply to Neil Maccallum, clerk to Deacons' Court, Stornoway, to whom submit tenders by March 2.

March 2. TREORCHY.—Erection and completion of eight or more houses at Pencelli Estate, for Messrs. Davies and others. Plans, specification, and form of tender, of the architect. Tenders by March 2, to W. D. Morgan, M.S.A., architect, 194, Ystrad Road, Pentre.

ARCHITECT'S Assistant (23), desires engagement; 7 years' eaxperience.—Sedgwick, Belvedere Road, Sunderland.

ARCHITECT and Surveyor's Assistant (25), 9 years' experience; excellent draughtsman, working drawings, details, specifications, perspectives, surveying, French, typewriting; moderate salary.—Arthur Bailey, 26, North Street, Hailsham, Sussex. 4819

ARCHITECT'S Assistant (23), late pupil, seven years' all-round experience, been clerk of works, working drawings, details, etc., knowledge of quantities and perspective.—E. P. Lee, 631, Commercial Road, London, E. 4781

ARCHITECTS, builders, estate agents (19), good energetic draughtsman, tracing, colouring, working drawings, etc.; willing to assist in office work; references.—F. J. Williams, 89, Shrubland Street, Leamington Spa, Warwickshire. 4796

ARCHITECT'S good all-round Assistant; 10 yrs.' exp. North, South, and Wales; quans., details, working drawings; mod. salary.—W. T., 14, Stanhope Road, Stockton-on-Tees. 4798

ARCHITECT'S assistant (23), over 7 years' London and Provincial experience; excellent references; Inter.R.I.B.A. Exam. — H. J. Wilson, "Brinkdale," Park Road, Peterborough. 4670

ARCHITECT and Surveyor's Assistant (21), seeks re-engagement; 5 years' experience in church and domestic work in larger provincial office; good draughtsman and colourist.—Box 4823, Builders' Journal Office.

ARCHITECT'S Junior Assistant (19), 4 years experience in West End Office, working drawings, details, perspectives, competitions, excellent references; salary 21s.—Box 4777, Builders' Journal Office.

ARCHITECT'S and Surveyor's Assistant, 15 years' good practical experience; excellent draughtsman, designer and colourist; working drawings, details, specifications, surveying, levelling and general routine; excellent references; moderate salary.—A. R., 1, Ivy Villas, Cheam, Surrey. 4862

ARCHITECT'S, Surveyor's or Builder's Assistant (23), Inter.R.I.B.A., good draughtsman, levelling, surveying, specifications, assist quantities, supervision, estate work, correspondence, accounts; excellent references; moderate salary.—H. O'R., 80, Lavender Sweep, Clapham, S.W. 4810

ARCHITECT'S Assistant, thoroughly experienced, temporary employment; domestic work, business premises, schools, etc.; surveying and levelling, etc.; two years' experience in Structural Engineer's office; salary moderate. — Box 4820, Builders' Journal Office.

ARCHITECT'S Junior Assistant disengaged, 4½ years' articles, wishes to meet with architect in Lancashire office; specimen drawings, certificates for construction; sitting for Inter. R.I.B.A., June.—Apply, J. S. H., Wittington Lane, New Springs, Wigan. 4815

ARCHITECT, estate agent, or builder's assistant, experienced in all branches; good references.—R. S., Eagle House, Marine Parade, Clacton-on-Sea. 4816

ARCHITECTS, and builders, experienced surveyor open to prepare quantities and estimates, check accounts and measuring; moderate terms.—Apply Box 4817, Builders' Journal Office.

ASSISTANT Draughtsman disengaged, student R.I.B.A.; prizeman in classic and mechanics, A.A.; good all-round London experience; salary 20s.—148, Shooter's Hill Road, S.E. 4864

ASSISTANT A.R.I.B.A. (29), 14 years' London and Provincial experience; working drawings, details, specifications, supervision, perspectives, assist quantities, well up in management; testimonials; references; salary, 2 guineas.—Apply A, 31, Cotswold Road, Westcliff-on-Sea, Essex. 4775

BUILDERS' Assistant desires situation; thorough knowledge plans, specifications, quantities, measuring; not afraid of work; salary not so much an object as permanent situation; 21; 5 years' experience.—Box 4839, Builders' Journal Office.

BUILDER'S Assistant or Manager; thoroughly efficient; moderate salary if prospect of hard work and exceptional ability being recognised; 23 years' experience.—Alpha, 191, Park Crescent, Grimsby. 4877

BUILDERS', Surveyors' Assistant (24), capable and reliable, seeks re-engagement, thorough practical knowledge of construction, surveying, measuring up, good draughtsman, supervision, also costs, accounts, wages, etc.; mod. sal.—Box 4841, Builders' Journal Office.

BUILDERS' Assistant desires work; plans, estimates, setting out buildings, measuring up, prime costing, surveying, and levelling plots, ordering exact quantities, materials; 11 years' experience.—Box 4803, Builders' Journal Office.

BUILDER'S or Architect's Junior Assistant (18), good tracer, well up in prime cost, and general office work; excellent references; three years' experience. — J. W., 164, Wellesley Road, Ilford, Essex. 4833

CARPENTER, or Handy Man, tall; age 34; take charge on large jobs, wants work; 7 years' good reference; moderate salary.—H.C., Box 4838, Builders' Journal Office.

CLERK of Works seeks re-engagement; just finishing public building; varied experience, notably ferro-concrete construction; well recommended; testimonials most excellent; age 45.—A. B., Box 4814, Builders' Journal Office

CONTRACTOR'S outdoor manager and surveyor desires engagement; present situation 17 years; age 37; keen on variations; expert in measurements; all trades, quantities, estimating; town or country.—W., 2, Dalberg Road, Brixton. 4776

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, Builders' Journal Office.

ENGINEER, general, wants permanent appointment, official or private staff; **thorough all-round** experience; electrical, **plumbing, smith, married,** 34; good **testimonials.—86, Bathurst Gardens, Willesden. 4704**

ESTATE Owners.—Bricklayer, all-round, stonewaller, and general repairs; abstainer; good references; moderate wage for permanency.—Quinton, 12, Holland Road, Aston, Birmingham. 4802

FIREPROOF Engineers and Concrete Specialists. Advertiser, connected with above trades for 10 years, and whose name is well known in connection with same, desires position as manager, traveller, or head clerk; first-class book-keeper; aged 33; very moderate salary.—P. W. Potter, 73, Penshurst Road, Thornton Heath. 4719

FIRST Class Architectural Designer and Draughtsman, artistic and practical, experienced in planning; elevations and details, office and competition work; moderate salary.—Apply Box 4792, Builders' Journal Office.

FOREMAN Painter (working) seeks re-engagement); experienced in all class work in building trade, as for general alterations, etc.; good supervisor, and reliable; either town or country; abstainer.—X. Y. Z., 8, Barton Street, Westminster. 4807

GENERAL Foreman seeks re-engagement, thoroughly practical in all branches; trade, carpenter and joiner, good draughtsman, first class references; town or country.—**A. J., 196, Murchison Road, Leyton.** 4804

GENERAL Foreman seeks re-engagement; alterations or new, practical experience in all branches; carpenter and joiner; good references; age 36; moderate wages.—Caplen, 3, Victoria Mansion, Edgware Road, Paddington, W. 4779

GENERAL Foreman seeks re-engagement, thoroughly practical and reliable; new or alterations; carpenter and joiner; life abstainer; first-class references.—Foreman, 3, Hawbridge Road, Leytonstone. 4787

GENERAL or builder's foreman, energetic, reliable, good timekeeper, trade bricklayer; age 32. Good refs.—G. C., 44, Richmond Park Road, Kingston-on-Thames. 4863

JUNIOR Assistant desires situation, home . abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate **salary.—Box 4613, Builders' Journal Office.**

MACHINIST seeks situation; spindle fourcutter, etc.; married, age 32; total abstainer and good timekeeper.—Machinist, 46, Priory Street, Tonbridge, Kent. 4874

PAINTING, paperhanging, distempering, graining wanted, piecework, new work at greatly reduced prices; specimen showing architects' and surveyors' testimonials for quality and cheapness.—Galton, 6, Parolles Road, Upper Holloway, N. 4861

PLASTERER, good jobbing bricklayer, roofs, fire work, stoves, tiling, etc., etc., generally useful, good reference, moderate wages, non-union.—A. Trigg, 117, St. John's Hill, Clapham Junction, S.W. 4856

QUANTITY Surveyor's Assistant (21), 4 years' experience, desires engagement, certificates and good references. — Apply Box 4745, Builders' Journal Office.

QUANTITY, General Surveyor's Junior Assistant, four years' experience; working up measuring existing buildings, good draughtsmen, little estate work; City Poly student.—J. R. O., 233, Essex Road, N. 4844

SHOP-FITTING, advertiser (38), well up in all branches of air-tight work, seeks situation as foreman in shop-fitting or joinery works; 9 successive years' with present employer.—Apply, Box 4837, Builders' Journal Office.

SURVEYOR'S Assistant seeks re-engagement, 9 years with City firm; highest references; surveys; levels, estate management, etc.; shorthand and typewriting, if necessary. — J. P. K., 21, First Avenue, Manor Park, Essex. 4873

TO Estate Owners, builder, experience, in all trades, desires position as manager (working or otherwise); plans prepared, quantities, setting out, accounts and supervision; abstainer; country preferred.—Box 4806, Builders' Journal Office.

VOLONTAIRE.—Foreign gentleman (21) desires position in builder's office, with opportunity of learning.—B. B., 43, Bolingbroke Grove, Wandsworth Common, S.W. 4789

YOUNG Gentleman, with good business pushing qualities, wants situation, experienced buyer in quick selling lines; timber, matchings, joinery, mouldings, etc.; building materials, ironmongery, oils, colours, glass, garden requisites, practical experience, good references; will manage small cash business and develope it. — Box 4872, Builders' Journal Office.

Appointments Vacant.

ARTICLED Pupil, vacancy for same in an old-established architect's and quantity surveyor's office, on the South coast; trained under principals; moderate premium; part returned. A typewriter will receive greater consideration.—Apply Box 4822, Builders' Journal Office.

PARTNERSHIP.—Builder and contractor (established), employing workmen for all trades, at present engaged in developing the town council's new estate in an important and flourishing seaside resort on East Coast, requires experienced young man (some capital necessary), for a partner.—Apply first (in confidence) with particulars to Box 4870, Builders' Journal Office.

WANTED, travellers with established connections at present representing other houses, for the sale of Duroline, a transparent and unbreakable glazing material, to supersede glass for lighting factories, workshops, etc., and other roofing specialities. For terms and particulars apply The Duroline Wire Wove Roofing Co., Ltd., Imperial Road, Fulham, S.W. 4865

WANTED, traveller, floor, wall and hearth tiles; London and suburbs.—Apply Manager, Malkin Tile Works Co., Ltd., 65, Charing Cross Road, London. 4869

March 3, 1909.

The R.I.BA. Board of Examiners.

The policy of the Board of Examiners in admitting, year after year, an inordinate number of imperfectly educated youths to swell further the ranks of an already terribly congested profession is, to say the least, open to criticism, and, for many reasons, it appears to us to be one to be deprecated and deplored. Indeed, we do not hesitate to predict that active steps will have to be taken, and that soon, to prevent the continuance of an ill-advised system which there is little doubt is reacting disastrously upon the welfare of all properly qualified architects. A glance at the constitution of the body officially responsible for the selection and (rejection) of the aspirant to an artistic career does not encourage the belief that it is adequate to the efficient discharge of the delicate duties imposed upon it. We have no desire either to wound the susceptibilities or to belittle the services of the many estimable members of the profession who, with the best intentions in the world, have devoted much care and attention to the work of the Board of Examiners. But, nevertheless, we feel compelled to say that we should like to see the *art* of architecture more adequately represented on that body. It is perfectly obvious that the "surveying" element is far too largely represented on the Board. Much more could be said on this subject; but for the present we refrain from closer analysis, as we desire to deal with principles rather than with persons. We must add, however, that, in our judgment, *all* examinations for architects should be conducted *solely* by the most scholarly and artistic men the profession can produce. Yet, probably, of the forty-four members constituting the Board, barely more than half the number would be found to pass satisfactorily this admittedly somewhat exacting test. We suggest that the soon the custom of enlisting *outside* assistance in the preparation of papers set in the preliminary examination is abandoned the better it will be for the success of the examination. What is wanted (in substitution for the present test of "general culture" now carefully adjusted to the standard of a Board School education) is an *informal* inquiry, conducted by properly educated and cultured men, into the candidate's antecedents and education,—the extent and scope of his general reading, and his knowledge and appreciation of the literature, art, and science of his own and other countries. In short, a preliminary examination should be instituted, such as that sometimes imposed by heads of colleges at our older Universities, prior to the admission of candidates to residence within the ancient foundations of the more popular of these schools of learning. A test of the kind we have indicated, is a veritable examination in "general culture" which (*pace* the Board of Examiners) the present preliminary examination does not supply, even though the ordeal to be faced by the candidates under its existing regulations includes investigations regarding the embryo architect's knowledge of "English Composition," "Writing from Dictation," and "Arithmetic, Algebra, and the elements of Plane Geometry."

The Press, Lay and Technical.

Mr. Needham Wilson's somewhat caustic review of the general attitude of the lay Press towards architecture, in his clever paper read to members of the Architectural Association expressly excludes the professional Press, to whose merits he pays a generous and gratifying tribute. The architect is, of course, a "reading man," a discerning critic trained in the nice judgment of "values," and his appreciation is therefore as the "praise from Sir Hubert Stanley." We make our bow to Mr. Needham Wilson. The expression, "professional Press," however, is perhaps not quite sufficiently comprehensive. The organ that an architect finds most interesting and useful deals with every aspect of building. It is, therefore, industrial and commercial, as well as professional. Perhaps "technical" would be a more inclusive term. But the point is of merely academical interest. What is of real practical importance is that the well-conducted technical journal aims at being a sort of central exchange by means of which the architect, the contractor, the merchant, the specialist, and even the craftsman, are put into profitable communication with each other. Each wants to know what all the others are doing, and the up-to-date journal tells him, promptly and definitely; and it should be of about equal value to the representatives of all these interests. That the reading habit, to which architects need no incitement, is spreading rapidly, and is already widely diffused, among other denominations of builders, we are in possession of the most gratifying evidence. The National Federation of Building Trade Employers have realised that their members needed a medium of intercommunication that should not only record their own transactions, but should keep them well abreast of the times by showing them everything of importance that is being done in other directions—the latest developments in ideals, methods, and materials, at home and abroad. That they have found in this journal an eminently satisfactory medium for the dissemination of such useful and interesting information is evident from the cordiality with which its name is always received at association meetings. The discriminating eulogies of the journal by speakers at these meetings prove that the complete builder, like the complete architect, is fully aware that, in order to maintain his claim to that proud title, regular and attentive perusal of an up-to-date technical journal is a primary essential.

Brighter Prospects.

Although it cannot be said that, for the moment, trade is actually and palpably better than it has been for many weary months—one might almost say years—it is nevertheless gratifying to note everywhere a sudden and very marked increase in optimism. "True hope is swift, and flies with swallow's wings." This welcome accession of courage and cheerfulness may be either the cause or the consequence of improved conditions. Perhaps it is both. To anticipate either failure or success is to court the one or the other; and whether or not the more hopeful tone with which architects and builders have rather suddenly become inspired is due to observed indications, or even to some subtle and inexplicable sense that things are about to take a turn for the better, it is very certain that concerted hopefulness must, of its own inherent force and influence, tend towards materialisation. On the other hand, those who (to use an expressive colloquialism) are "looking for trouble" seldom fail to find it. The present depression seems to have been largely a matter of human feeling, or incompetency, or distraction. The world's wealth has not been sensibly diminished by plague, pestilence, famine, or other great convulsion beyond human control. It is all a matter of administration, adjustment, distribution. Things had got into a seemingly hopeless tangle. Energy and enterprise seem to have been taking a rest, and should now arise strengthened and refreshed by the long period of recuperation. The greater buoyancy and confidence that are becoming manifest have in some directions taken tangible shape. For example, we read, with regard to the property market, that "Transactions of all kinds, at the Mart, in the country and suburban sale-rooms, and by private treaty, notified to the Estate Exchange this year, show a decided improvement in comparison with those in the like period of

1908, being £385,855, against £294,121." Then, improved prospects for the building trade in London are freely prognosticated. The new wing to the British Museum, upon which preliminary operations are in progress, should make builders the richer by £450,000. The Bedford estate is being developed, and a new thoroughfare from Torrington Square to Montague Place, opposite the main entrance of the Museum extension, is bringing grist to the mill; and other important works in hand are the extension wing of the National Gallery, the Admiralty extension in Spring Gardens, the new offices in Whitehall for the Commissioners of Woods and Forests, and the preliminary work for the new London County Council Hall in Belvedere Road; while new military recruiting offices are to be built in Great Scotland Yard. In the country, the boom in secondary schools and "places of higher education" is likely to increase rather than to abate; and now that foreign manufacturers are feeling the effects of the new Patents Act, they are making haste to have factories erected in this country. Altogether, there would seem to be fair warrant for the more optimistic outlook that is beginning to prevail. At all events, it is wise and helpful to cultivate hopefulness, and to shun pessimism as if it were a pestilence. The lamentations and the speculative adventures of Jeremiah ("Jerry" for short) are of particularly bad augury for the trade, and it is delightful to find that they are being generally discredited and discarded.

Housing Exhibitions.

Almost simultaneously with the announcement that a rather heavy call on the guarantors has been found necessary in connection with the housing exhibition at Walker-on-Tyne, it is stated that the work of preparing the site for the South Wales Housing Exhibition, to be held at Swansea this summer, is being pushed forward as rapidly as possible. *Absit omen!* "Swansea may succeed where Walker has, in a manner of speaking, failed." But it may be presumed that, in an exhibition that is primarily intended to be educative, commercial success is a matter of quite subsidiary importance, and the guarantors were probably prepared to suffer in a good cause. When housing exhibitions began, widespread interest was aroused in the knotty problem of cheapness. Could small houses be built well and substantially at the low rates specified in the scheme of classification? That was the question; and now that it has been answered—not emphatically in the affirmative—curiosity has subsided. Successive exhibitions have been remarkable for their sameness, and their consequent tameness; the local variations being so insignificant from the general point of view as to fail to attract from a distance anybody outside the ranks of enthusiastic housing reformers, professional and amateur. But while results have been, so far, somewhat disappointing, there can be no doubt that such exhibitions stimulate, in a greater or minor degree, the art and the trade of the districts in which they are held; and the alert professional man or tradesman may find, even in the least successful of them, something to note and remember—some example to imitate or to avoid. They represent movement of some sort, even if it be but motion without progress; and that, at all events, is better than stagnation. Housing exhibitions, however, hardly escape the condemnation that was meted out the other day in a "Times" leader dealing with building regulations. "Sets of them are drawn up for urban and rural districts by people who have an abstract conception of what houses ought to be. When these come to be applied to the erection of agricultural cottages in a particular locality, the beautiful result is that cottage building comes to an end. Cottages built according to regulations are too expensive for the people they are meant to house, or they are not the sort of cottage that the people like, and the population does not change its ancient habits just to suit the doctrinaire. It is quite possible to build good comfortable cottages suited to the district and within the means of poor people, but no one can do that without being exposed to legal proceedings. The doctrinaire wants to plant men upon the soil—an admirable expression, for he evidently thinks that a man can be planted as easily as a cabbage." Because the cheapest dwellings at housing exhibitions are usually required to comply with the "doctrinaire" regulations of the district, they necessarily become too expensive to be accepted as models of practical utility. The danger of relaxing those regulations, however, though ignored by the "Times" writer, is only too obvious. The so-called "doctrinaire" is not to be flouted and despised. He has initiated many valuable and priceless hygienic reforms. That he is given to running to extremes is no more than can be said of his opposite, the so-called utilitarian, who is too apt to fetch up in unmitigated slumdom. What is wanted is some fair middle course between these extremists. Perhaps the Swansea exhibition may show how we can arrive at it. If it does, it will deserve to be called epoch-making. A fresh experiment that is about to be tried by the London County Council on its Norbury estate touches the rent question. The Council is putting up ninety-five cottages on this estate. It was at first proposed that these cottages should uniformly consist of five rooms each; but it has now been decided that twenty-six shall contain four rooms each, and that half-a-dozen shall consist of three rooms and a box-room, so as to come within the means of "heads of families earning from 25s. to 30s. a week." It is pitiful that "heads of families," and the London County Council, should be driven to such shifts.

Sanitation.

Sanitary inspectors are fond of saying that the first sanitary reformer was Moses. Mr. P. M. Raskin, of Leeds, who read an interesting paper at a general meeting of the North-East Centre of the Sanitary Inspectors' Association the other day, did not repeat this platitude in so many words, but his title seems to imply it, for his paper was headed, "The Mosaic Sanitary Code and its Relation to Modern Sanitation." The Mosaic laws with regard to sanitation were chiefly directed towards the scourge of leprosy, and they were very drastic. Infected clothing was to be burnt, an infected house had to be emptied, the infected parts of the building removed, and the walls scraped. If the malady recurred, the whole house had to be demolished, and the materials removed to an unclean place outside the camp, and never used again. Mr. Pridgin Teale, who presided at the meeting at which Mr. Raskin's paper was read, remarked that nearly every one of the greatest cities of antiquity having disappeared, he thought it probable that such places as Babylon and Nineveh had been abandoned because they had grown beyond the power of the people to keep them sanitary. This is not a very far-fetched theory, and perhaps Mr. Teale does not claim originality for it. The Great Plagues and Black Deaths of more modern cities have doubtless been due to the same cause; and modern immunity to such visitations is entirely due to the advance of sanitary science. Abandonment of insalubrious districts is a practice that is much older than civilisation. The civilised method of removing the refuse from the dwelling is reversed by savages. They simply remove the dwelling from the refuse.

THE MARBLE ARCH ROYAL GATES.

The uncovering of the Marble Arch Royal Gates, the erection of which, it will be remembered, was commenced on November 9th last, the King's birthday, occurred on the day of the opening of Parliament by the King. The Royal gates, and others that have been erected on either side of them for the public use, practically complete Mr. F. W. Speaight's improvement. The design for the gates was made by the Office of Works, and the gates, which were made by Messrs. Martyn, of Cheltenham, are generally admitted to be one of the finest specimens of hammered iron work in London. They are all of wrought iron, executed in a free treatment, most of the ornament being generally associated with the Royal emblems. The centre of the Royal gates is 18ft. high and 16ft. wide between the piers. The main feature of the ornaments on these gates is the Royal Arms surrounded with the chain of the Order of the Garter, and surmounted by a crown from which a festoon of laurel leaves is suspended. The many hundreds of pieces were fused together by the aid of oxygen gas and acetylene. From the chain hangs the emblem of St. George and the Dragon, while in a lower portion of the gates the centre is fitted with the Tudor rose. This ornament is repeated four times, being on either side of each leaf to the pair of gates. The gates are so constructed as to open freely, without the usual track and rollers, on which horses are apt to stumble. On each side of the Royal gates are two railing panels, 12ft. high and 11ft. wide, the centre of the upper portion being a large Tudor rose upon a convex surface surrounded with acanthus leaf ornament and surmounted by a Royal crown. The lower portion is treated with foliaged scroll-work. There are upwards of ten thousand hammered iron laurel and palm leaves used in the whole design.

Following the railing above mentioned on either side are a double pair of carriage gates, each pair being divided by a large box pier, or rather a treble box pier, while beyond the carriage gates are the foot gates. The ornamentation of the carriage gates is again different from that of the Royal gates and railing, the design being composed of the Royal cypher upon a convex shield surrounded with wreaths of laurel leaves tied with ribbons from the bows of which spring sprays of palms, the whole being again surmounted with a crown. The over-all width of the carriage gates measures 32ft., and the height of the centre pier 13ft. The foot gates are treated in a similar way, and are 12ft. 6ins. wide, the height being the same as that of the carriage gates.

On the west corner of the new road there will be erected shortly further gates of similar importance and design to the carriage gates, also one pair of foot gates of simpler design, being somewhat similar to the panelled railings on each side of the Royal gates. On the south-west corner a pair of foot gates are also being erected, to give greater facility at the inner portion of the new road. These also are comparatively simple.

The total cost of these iron gates, etc., has been about £3,000, and they have given employment to some seventy or eighty craftsmen, for over three months. The weight of the combined gates is nearly 40 tons. All the materials that are being used for the work, as well as the labour, are British.

THE PRESS & ARCHITECTURE*

The Awakening.

Lately we have witnessed a vast change in the attitude of the Press to our profession and its productions. The moment is fraught with big events for architecture, in this awakening of the powerful English Press.

In Praise of the Professional Press.

The author did not include the professional Press in his remarks. Architects, in his opinion, cannot over-rate the debt of gratitude owed to the professional Press, which has done so much to promote the best interests of our art, to foster its appreciation, and to advance its progress in the best channels. It would, he said, be ungracious not to pause to acknowledge the help and assistance which the Association had received from the professional Press, and all those connected with it, from the editors to those gentlemen who report what are only too frequently, he feared, dull, lame, and halting speeches in that room. We have little to complain of in our professional Press, which, indeed, did not come within the scope of his paper.

How to Acquire Fame—Cheap.

The daily Press has a tendency to rush from indifference to the other extreme, and thereby offer a temptation to the young and struggling man to make a desperate attempt to escape from the trammels of obscurity, and to launch himself on a career of fame. The process is simple. Hatch up a wild-cat scheme, preferably connected with a public building, dish it up in as splashy a drawing as you can, and send it to the—well, a daily paper. Do you think a dome would look well on Westminster Abbey? Send it to the Press. Why not rebuild the Bank of England as a skyscraper? Send it to the daily Press. Cover in Trafalgar Square with steel and glass—send it to the daily Press. Cannot you find a site for an unnecessary public building? Then put it on an artificial island in the river and send it to the Press.

Crazes and Scares.

This suddenly awakened zeal in architecture has taken another strange phase of recent years, partly accentuated by the Garden City and cheap-cottage craze, and such incidents as the settlements in St. Paul's Cathedral. So much public attention was drawn to these matters, that the reading public realised for the first time that there existed a class of individuals known as architects, and the doubtful privilege of the "interview" was extended to members of the profession.

Discovering the Finest Building in London.

Then there was an endeavour, in one of the evening papers, to discover the finest building in London. The result must have been somewhat bewildering to the reading public if they read the opinions at all. And if they came to any conclusion it must have been one of contempt. Still, the attempt was, on the whole, commendable, as it probably led many to realise for the first time that fine buildings did actually exist in London. This is something achieved by the Press, though whether as a result architecture has been advanced is open to question, and for architects there seems only a step between this kind of thing and the advertisement columns.

This

Tardy Recognition of the Architect

by the Press is but a bare act of justice long delayed, and in its inception naturally ill-expressed. Hitherto he has been consistently ignored. The painter who executes in pigments the creation of his brain, and the sculptor who puts in concrete form his fancies, are recognised as the authors of their creations, and are open to adulation or criticism according to the fad of the moment. Indeed, a Press warfare may rage around their work if the Press, that stern guardian of public morals, decrees so.

Delicate Details.

Editors of the lay Press appear to consider that the public are chiefly interested in the exact number of bricks used, or the precise quantity of cement employed, or the number of men engaged, and how many were killed or injured, and how many gallons of beer they drank. They hardly go far enough. Why do they not add the age of the contractor, a brief family history of the quantity surveyor, the weight of the clerk of works, and such interesting details? Why does it not occur to these editors to give the number of drawings made, the aggregate of hours spent upon them, and the quantity of pencils used? Why not detail the time occupied in party-wall disputes, struggles with innumerable authorities, and other engrossing matters?

The Man, the Method, and the Moment.

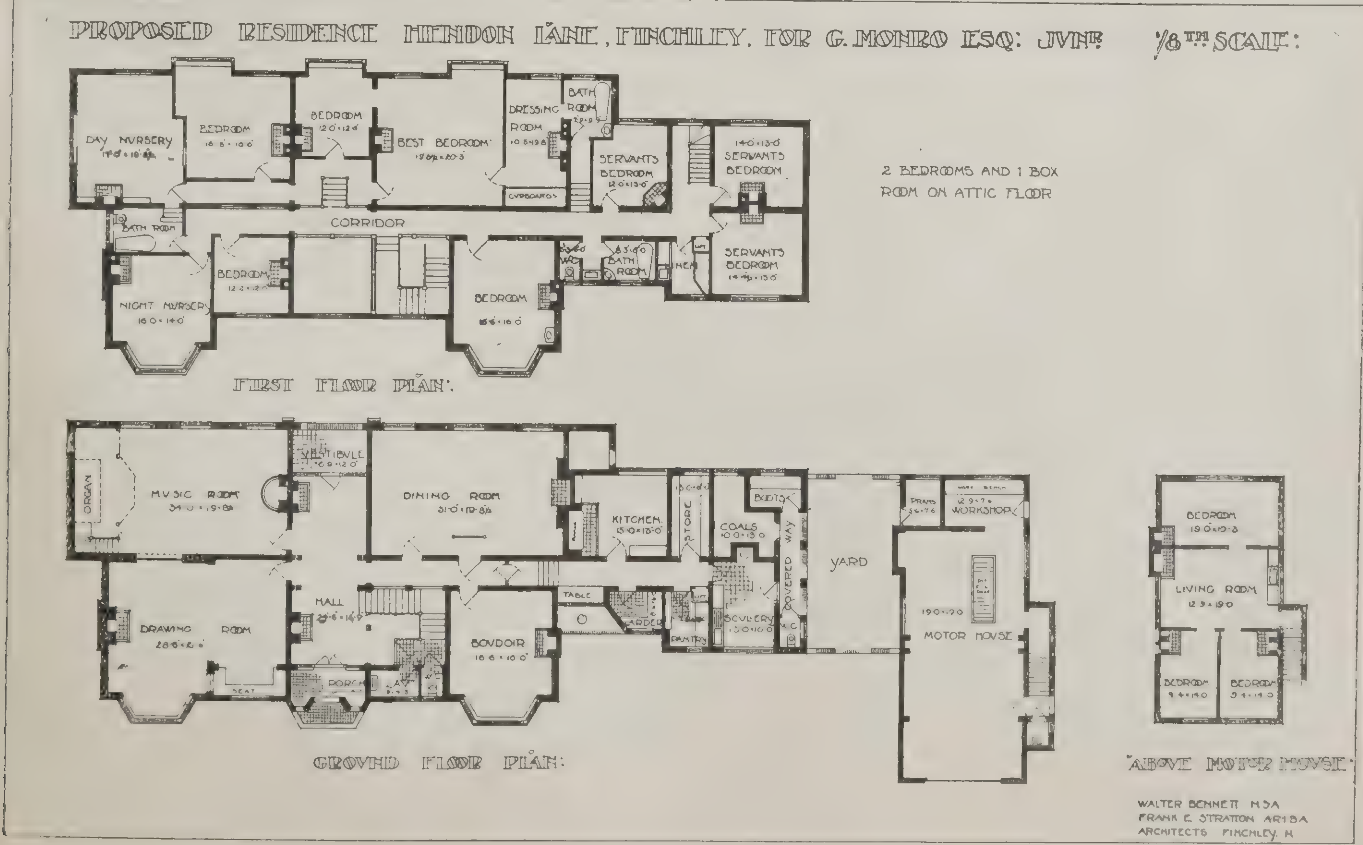
But hitherto no one has been interested either in the method by which a building is produced or in the man who produces it. Now, however, that the public have discovered that a building does not rise spontaneously, and that there is a directing and controlling force known as the architect, there is a tendency to rush to the opposite extreme, and advertise the architect at the expense of the architecture. This tendency has been aggravated by the result of the competition for the County Council Hall, where the picture of a young man, rising suddenly in prominence and fame, appealed strongly to the Press, and through it to the public. But what appealed more strongly still was the remuneration. You all saw it—in heavy leaded type—"A FORTUNE AT THIRTY-TWO!" Such minor points as that the receipts would spread over many years and be subject to heavy deductions for expenses, were absolutely ignored. The impression conveyed was that the successful author had done his work, had received so many thousand pounds, and there his interest ceased. Apparently not one of the papers took pains to present the facts of the case, and how many presented a serious and authoritative criticism of the designs? Still, there is the salient fact that the architect has been discovered and has received a certain amount of recognition.

Architect Anonymous.

How different from the time when the Imperial Institute was opened amid circumstances of unusual public interest, and extreme pomp and ceremony. The papers were full of it, and devoted column after column to the event, but the author could not remember one which even hinted at the existence of an architect. Certainly, views of the building were published, but it is significant that the name of the author should be considered of insufficient interest to demand publication. There is no need to multiply instances. They will occur only too readily. But the promi-

---

*Abstract of paper read by Mr. A. Needham Wilson, before the Architectural Association, on Feb. 19th.



nent fact remains that only recently has it dawned upon Press writers that some man is responsible for a building which attracts public attention.

The architect, after a prolonged period of obscurity, working beneath the surface, so to speak, producing art for art's sake, is just beginning to creep into the light of the Press, and is here and there receiving public recognition in the shape of well-deserved honours. In honouring them, the profession as a whole has been honoured, and in honouring the profession our art has been honoured. This lack of recognition for benefits conferred upon the community has been due to a variety of causes. Partly the indifference and ignorance of the public, partly the lassitude of the profession, and partly the attitude of the Press.

Clumsy Ridicule.

For long years whenever the architect has appeared in the pages of our journals, he has served as a butt for the shafts of somewhat clumsy ridicule. Occasionally I confess the ridicule has been deserved. More often it has not, and the daily Press, taking its cue from the pages of "Punch," has continued a campaign of satire, which I submit has now become pointless and ill-deserved. I do not think as a profession we are more thin-skinned than other professions, or that we are free from foibles, and we do not claim immunity from the cheap sarcasm which passes for wit. What we want, and what we do not get, is intelligent criticism from persons qaulified to criticise. Here, I again submit, we have a genuine grievance against our otherwise excellent Press. On the rare occasions when an architectural article is required, how often is an architect employed to write it?

Not long ago, I was staggered to see in a sober evening journal, and not one of the sensational journals either, this very unfamiliar heading:—

ARCHITECTURE IN THE WEST END.
By An Architect.

and a very good and well-written article it was, to my mind. I make the editor my compliments!

Blessed Ignorance.

Scarcely a newspaper article, description, criticism, or witticism, scarcely a magazine article, scarcely a story or novel, but has contained some glaring solecism or inaccuracy which has excited the derision of the architect. But then the reader does not know in his blessed ignorance, and the architect has left him to wallow in it.

How is it that we never see corrections of architectural inaccuracies? In a novel by an extremely well-known and popular living writer is a description of an invalid's bath-chair being wheeled down the steps of the house by means of planks laid from the *lintel of the door* to the ground. Not one critic seized upon the solecism. Was the author who wrote of the "stone gargoyles which grinned down upon the passers-by *from each stone mullion*" held up to public derision as a person with a little dangerous knowledge? Not at all. Was the lady who wove a novel round one of our English cathedrals, a novel full of gushing and fulsome anachronisms, pulled up for references to cloisters which simply do not exist? Never to my knowledge.

Showers of Blessings.

Almost a worse type of offender is the one who has a nodding acquaintance with technical terms and showers them upon the long-suffering reader as proof positive of his superior knowledge—a blatant assertion of his real ignorance.

I venture to think, however, that this state of things is passing away, and the colossal ignorance hitherto shown will no longer be tolerated by a better educated public. I suggest that the Press is lagging behind and but slowly following the public demand, instead of exercising its true function in leading and developing.

Influence of Environment.

It is not realised how intimately the daily life of the community is associated with the buildings in which it dwells, worships, conducts its business, works, amuses itself, houses its museums, its works of art, its learned societies, its law courts, its vast system of government. The very necessities of life are bound up in the edifices which meet the eye everywhere. The influence of environment upon the development of the community, as affecting not only its health, but its moral welfare, has received but scant attention in the daily Press, though the awakening knowledge of hygienic necessities has developed more interest in the matters of housing. Even now I suggest that so important a subject as this has not received the attention it demands

Beslubbered Slums and Slighted Suburbs.

Plenty has been written about the slums of our big towns and cities. Plenty has been written about our villages, but who has dealt adequately with our suburbs? I do not mean the suburbs with their detached or semi-detached residences nestling amid greenery and trim gardens, but the drab, gloomy, interminable streets of dull and sordid houses—all ground out of the same mill—with little to relieve the monotony of sooty bricks and mortar, save utilitarian lamp-posts and untidy back yards. It is saying too much to assert that if the Press had done its duty these acres of dreary monotony would have been an absolute impossibility?

Housing and Town Planning Reform.

Surely it is a matter of education, and the Press could raise its powerful voice to urge so necessary a reform. Why should our land be blotted and spoilt by ugly towns and villages for lack of the necessary teaching? We architects cannot do it for fear of the accusation of "touting" for work; but the great Press can, and should.

The Press has the power to mould public opinion for good towards the betterment of the community. It has done it before, and now that it has discovered that such beings as architects actually exist, and that there is such a thing as architecture as distinct from building, let it cease from jibing and deal with great issues.

The Human Nature in Architecture.

Now I turn to another phase, which I think has received no attention at all. It is wonderful to me that the Press has been so long in discovering the human nature in architecture—human nature as expressed in every feature, every moulding, every piece of timber, every worked stone. Does not the Press see the history written or unwritten in architecture? Has it not dreamt of the romance wrapped in every ancient building?

An Appeal to the Press.

I disclaim any advocacy of advertisement for architects, merely pleading that since the eyes of the Press and public are opened, the knowledge of the latter may be intelligently guided. I am only desirous that the efforts of the Press should be directed in the right way for the furtherance of an art so intimately associated with the life of the people, and the perfection of which, both artistically and practically, is essential to the well-being of the nation. It is not as if we architects had stood still. We have made great efforts to advance our profession, and, I think, with success, for surely modern architecture never stood on so high a level as it does now. That being so, we can appeal with confidence to the great power of the Press to lead in the further advancement and development of our art in the public interest

---

Discussion.

Mr. Edward Salmon, of the "Saturday Review," proposed a vote of thanks to Mr. Needham Wilson, and said that as a pressman he thought the address had been delivered to the wrong audience. Mr. Wilson had enlarged on the shortcomings of the Press in a way worthy not only of an architect but of a pressman. Had he not been so well acquainted with Mr. Wilson, he should have credited him with an intimate connection with journalism, for he had given away the foibles of that profession generally. The Press had its art and legal critics, but, judging from the lecturer's remarks, it would appear that the Press was well informed on all subjects except architecture. This attitude reminded him of a story told in connection with the late W. E. Gladstone. A Japanese gentleman sought an interview with the great Liberal leader, and discussed many of the problems engaging thought at that time. Shortly after this interview he (the Japanese) met a friend to whom he described his impressions. Mr. Gladstone, he observed, was a greater man than he had previously thought him to be. His knowledge was profound. The only subject with which he appeared to be quite unfamiliar was Japan. It seemed to him (the speaker) that the Press belonged to the same order of erudition. He had noticed that Mr. Wilson had culled all his evidences of ignorance in regard to architecture, not from the daily Press, but from novels. Why should not the novelist utilise the lintel if he so wished? The novelist took unwarrantable liberties with humanity at large, so why should he not do so with architecture? And probably the lintel was introduced with a purpose. Might it not have been in order to upset the bath chair and kill the occupant? Again, the lady novelist had introduced into her cathedral, cloisters, obviously for the purpose of her story; what harm was there in that? He took the paper seriously, however, and felt that something should be done. But between feeling and doing there was a great gulf. A well-known journalist recently had told him that Kingsway was being turned into an architectural monstrosity. He (the speaker) suggested that Mr. Wilson should organise a personally conducted tour in order to point out the shortcomings of Kingsway.

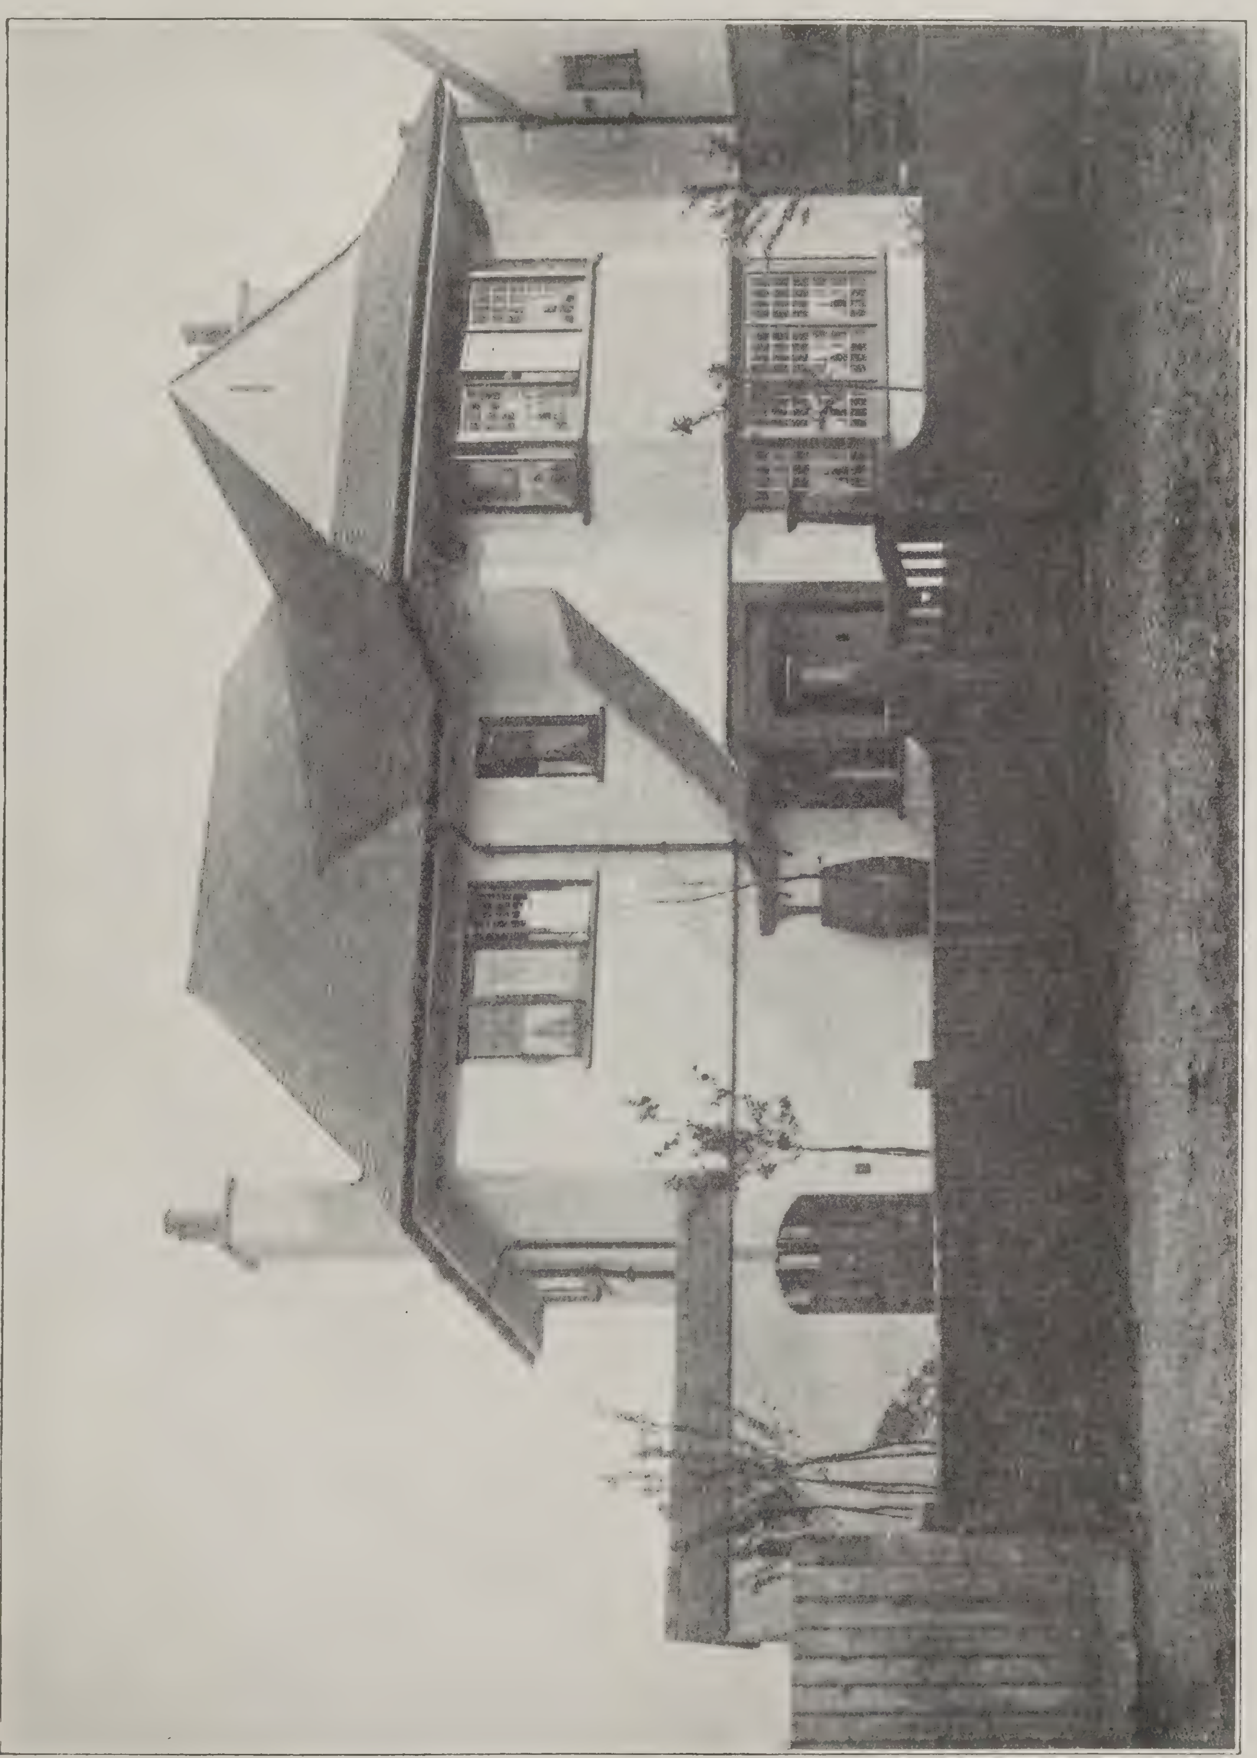
Mr. Louis Ambler, in seconding the vote of thanks, deplored the small audience, but supposed it was due to the fact that the younger members of the association had stayed away, believing the present paper to be of no interest to architecture. He said emphatically it was. It seemed that interest only centred round a building when it was opened by royalty, or when a foundation stone was to be laid by a personage of note. It was then and only then that the architect came into anything like prominence. The provincial Press paid more attention to, and gave fuller descriptions of, buildings in its columns, obviously because the opening of a new building was an unusual event.

Mr. F. D. Clapham said he believed that articles on architecture in the daily Press, however well written, were penned compulsorily in accordance with the editor's instructions. Hence, the public would read with awe that if the bricks employed in the construction were laid end to end, they would form a chain reaching from Land's End to John o' Groat's. "This," they would say, "is a very fine building." He believed that the public hardly knew what to make of the architect. To them he was a sort of glorified plumber, and was the man they would think it right to consult about a leaking tap, and other little questions of that kind.

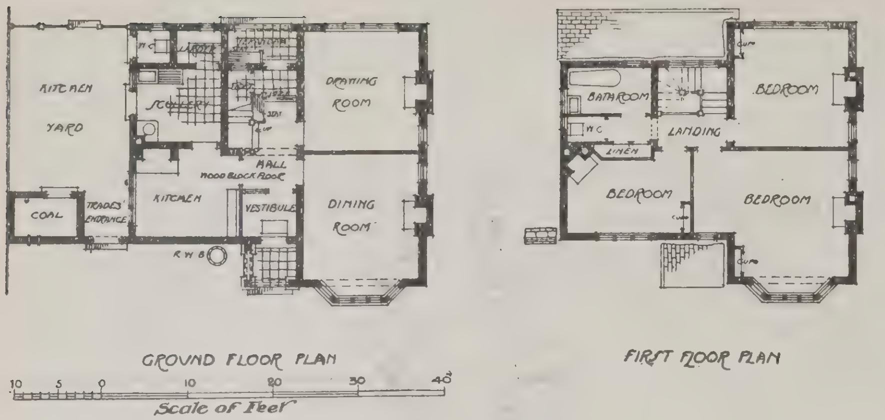
Mr. Alan E. Munby supported the vote of thanks, and recorded his confidence in registration as a possible remedy for the many ills endured by the architect. There were two sides to every question, and the architect should see that he performed his part to satisfaction. A line of distinction should be drawn. At present, a man who made his hen-coops could call himself an architect. The public wanted educating; and it was chiefly due to a lack of this that they were quite unable to judge with discretion, what to dislike and what to appreciate.

Mr. Potter made a few observations, and the chairman, Mr. Henry Tanner, jun. (vice-president) observed that when the lay Press did deal with the subject of architecture, it invariably made egregious errors. He was rather anxious to know what building in Kingsway had been separated out for castigation, as he himself was the architect of one in that thoroughfare.

Mr. Needham Wilson briefly replied



HOUSE AT SELWYN ROAD, NEW MALDEN, SURREY. HAROLD KEMP, ARCHITECT.



HOUSE AT SELWYN ROAD, NEW MALDEN, SURREY. HAROLD KEMP, ARCHITECT.

THE INFLUENCE OF TOOLS ON WOODWORK DESIGN.

The above subject was very ably dealt with by Mr. A. Romney Green, B.A., at Carpenters' Hall, London Wall, E.C., on Wednesday, February 17th, this being the concluding lecture on woodwork, the previous ones having been given by Mr. Guy Dawber, and Mr. Troup, and summarised in this journal. It has always been, he said, a prime instinct of man to have durable goods, as good and beautiful as he can make them, for he is thereby gratifying not only his desire for beautiful things, but his passion for making them, which is a great deal stronger. The richly carved canoes of the New Zealand savages (some examples of which were shown, carved with sharp stones or shells), the sword of the Crusader, the spinning-wheels of the Norwegian peasants, and the public architecture of all great nations, bears witness to this passion. No generation working in this way can produce enough for its needs, but they bequeath more to their successors than they themselves received.

This instinct of man, to make his goods as durable and beautiful as possible, was, Mr. Green pointed out, liable to suffer defeat. However long they took to make their tables, etc., they had to make their tools as well; and some of the most beautiful tables were made with adzes, chisels, and gouges, instead of the elaborate tools with which our furniture is produced to-day. It was the desire to make their work more perfect that led these makers to invent new tools. Some old 14th century pew ends that were shown had been cut out of the solid, and the lecturer pointed out that the cracksand warping consequent on this method suggested the framing of the wood together. This gave rise to the plough, which is a simple adaptation of the chisel. The turning lathe, he said, may have been suggested by the potter's table, and moulding plane was suggested by the plough for cutting mouldings, as accurately and with as little labour as possible. The carving on those old pew ends was done with nothing but the simplest tools. No planes were used, nor even drawing instruments for setting out the ornament; all were freehand, and yet the result was excellent.

An old carved French pulpit of the 16th century showed to advantage the use of simpler tools. In fact, simpler tools were much more frequently used, and a good joiner of that period was well on the way towards becoming a good carver. This pulpit, he remarked, was carried out as a recreation, and almost in a spirit of fun. Also, there was no doubt that it was designed by the men who put it together.

Passing on, the lecturer showed an example of a French 16th century chair, on which the plough had been used as a moulding plane. This, he said, is how the moulding plane was suggested, and was a great mistake. The joiner thereby lost much of the practice of simpler tools, and mouldings were much more interesting when cut with simpler tools than when worked with the moulding plane. In earlier days, there was no attempt to make the mouldings continuous, and there were no mitres. As a contrast to this, the lecturer showed an example of a 17th century door, and pointed out the mechanically cut and mitred panels. The 18th century door was, he considered, the most constructional of all. There were no bolts to rot and stain the wood, and the mouldings were "stuck"—even glue was unnecessary.

Dealing with the furniture of the Sheraton and Chippendale periods, he deplored the mechanical hardness of the carving; but this is not surprising when we consider that they preferred the moulding cut by a moulding plane, to the moulding cut by hand.

Drawing attention to a magnificent old Scandinavian chair of the 10th century, wonderfully carved, which was shown on the screen, he pointed out that where primitive tools have been in use, as in the case of the Norwegian peasants, there is very little change in the work, and that the furniture produced by these peasants in the 18th century might have been made by the same men as produced that 10th century chair.

This change in the character of the work and the influence of tools on design, whether for good or evil becomes still more pronounced with the introduction of modern machinery. Machinery, he said, tends to eliminate the human element in design, and also the influence of materials on design. For example, just as a hand-cut moulding is more interesting than one cut with a moulding plane, so is an adzed beam more interesting in form and surface than one which has been machine-sawn and planed. Our tools and machines are nowadays often more works of art than the things they produce. When a man invents a new machine he is as pleased as a child with a new toy, and if it be a moulding plane he covers his work with mouldings; if it be a turning lathe, he not only turns table legs and chairs, but cuts them in halves and sticks them about his plain surface as applied ornament. The use of machinery also has a further effect in the nature of a reaction. This may be seen in the almost morbid desire of our designer to do something novel. He determines to do something new at any cost. We may go to any arts and crafts' exhibition and find it full of monstrosities. Where, however, there is a living tradition, we find neither this great divergence of types nor exact similarity: one type of species grows out of another type of species, just as one geological era follows another. He would not say that the invention of new tools and machinery is fatal to art, although since the invention of labour-saving machinery, we have sacrificed the man to the work. Our factory operatives, builders' labourers, and artisans are treated as hands. Whether they are employed on a building job, or at the furniture makers, they are employed as machines in a purely mechanical way, supposed to be animated by the mind of a single architect or designer, who is probably ignorant of the materials being used. In the Middle Ages, however, the craftsman was an important person, and the craft guilds were as important as the merchant guilds, and beautiful art and architecture was produced by them. To-day our craftsmen do not belong to their guilds, and have hardly any money to buy their furniture. Good work, he pointed out, is never cheap, and the apparently cheap art of the Asiatic costs as much in rice and macaroni as our English beef and beer. Finally, he expressed an opinion that craftsmen will never again flourish in this country until they are sufficiently important persons to be their own architects and designers, and to belong to their own craft guilds.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Mar. 8.	*PONTARDAWE (WALES). Offices for the Guardians, in Holly Street. Premium £10 10s. The premium is offered by the Guardians "for plans with abridged specification, *which in their judgment* are best suited." Particulars and conditions from C. B. Jenkins, Clerk, Herbert Chambers, Pontardawe, S.O., Glamorganshire.
Mar. 17	†NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3.500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council. Stanley S.O., Co. Durham.
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.
April 10.	BOLTON BRANCH PUBLIC LIBRARIES. The Libraries Committee of the Corporation invite competitive plans from architects who have been principals in the County Borough of Bolton six months prior to the present date for Branch Public Libraries to be erected in the districts of Astley Bridge, Halliwell, and Gt. Lever. The plans and particulars may be obtained from Samuel Parker, Town Clerk, Town Hall, Bolton. Deposit, two guineas.
April 12.	ELLAND NEW SECONDARY SCHOOL. Architects having offices and practising in the West Riding of Yorkshire are invited to compete for the work in connection with the new Secondary School at Elland, and should apply for particulars to Mr. Leonard Clegg, Holiwell Green, near Halifax.
July 31.	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50. and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	BOURNEMOUTH BRANCH PUBLIC LIBRARY. Architects practising in the County Borough of Bournemouth are invited to submit designs for a new Branch Library at Boscombe. Particulars from Charles Riddle, Borough Librarian, Central Library, Bournemouth.

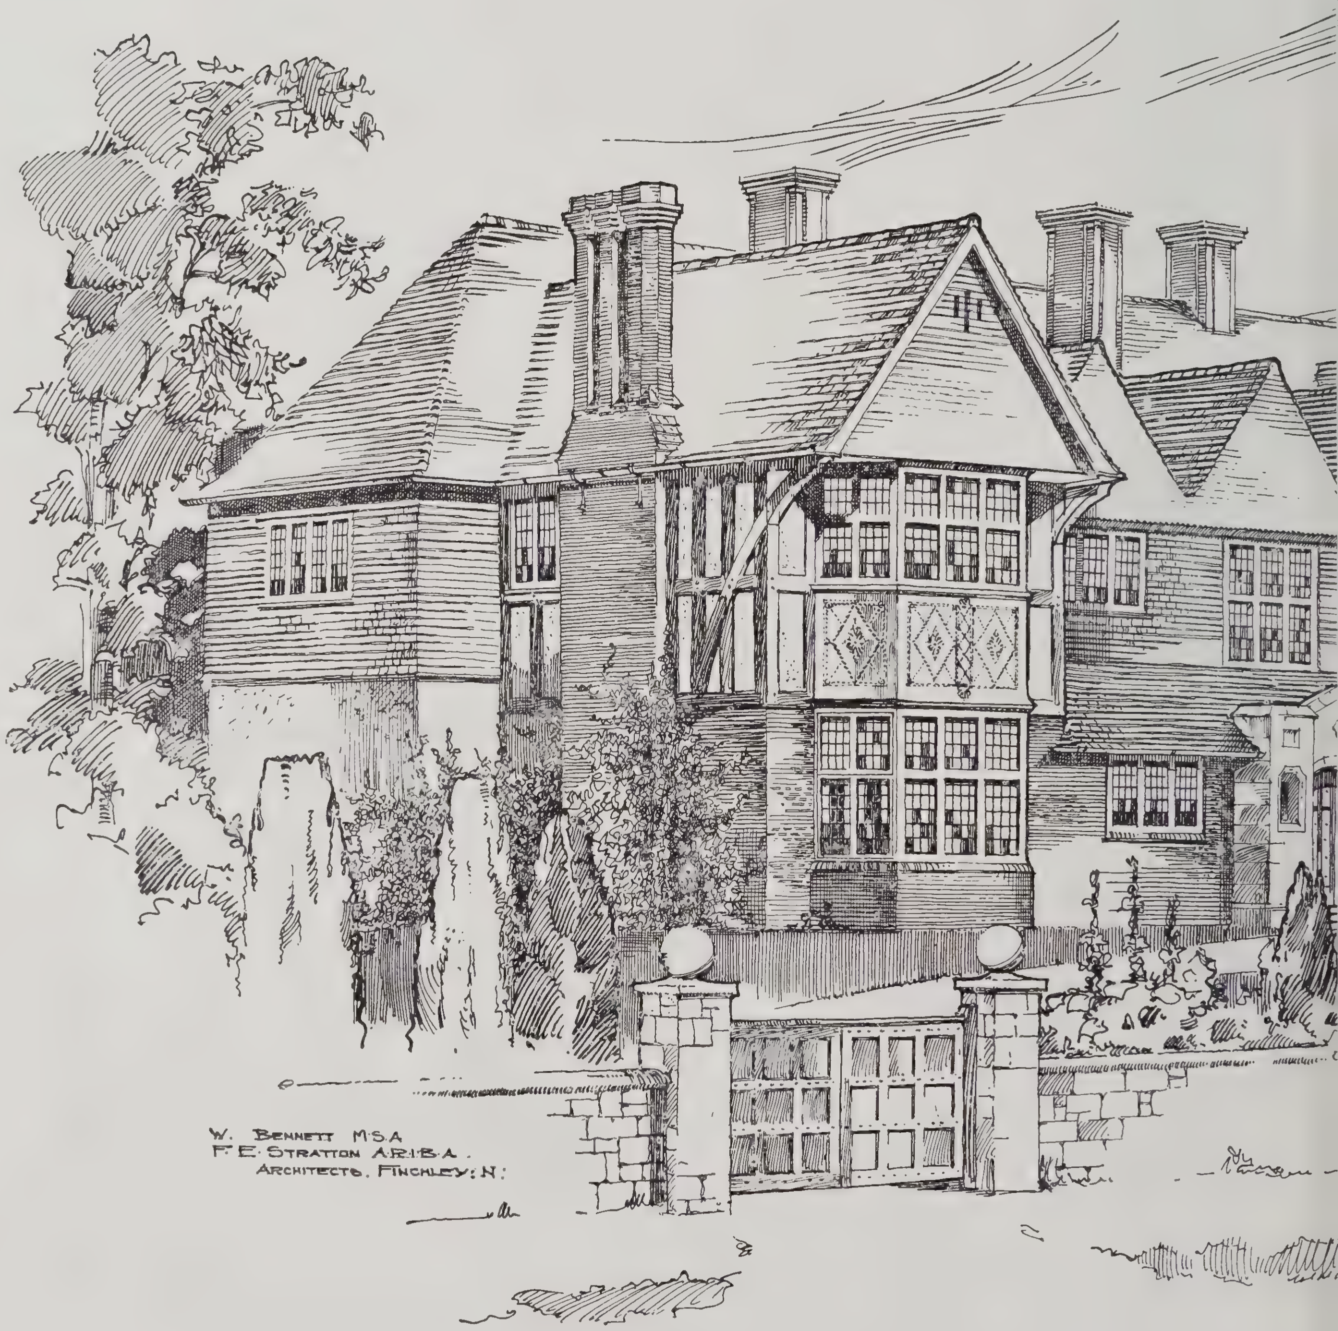
*We are advised by Mr. Jenkins that the supply of particulars and sketch plans is exhausted and no further applications can be entertained.

† The Royal Institute advises members not to compete.

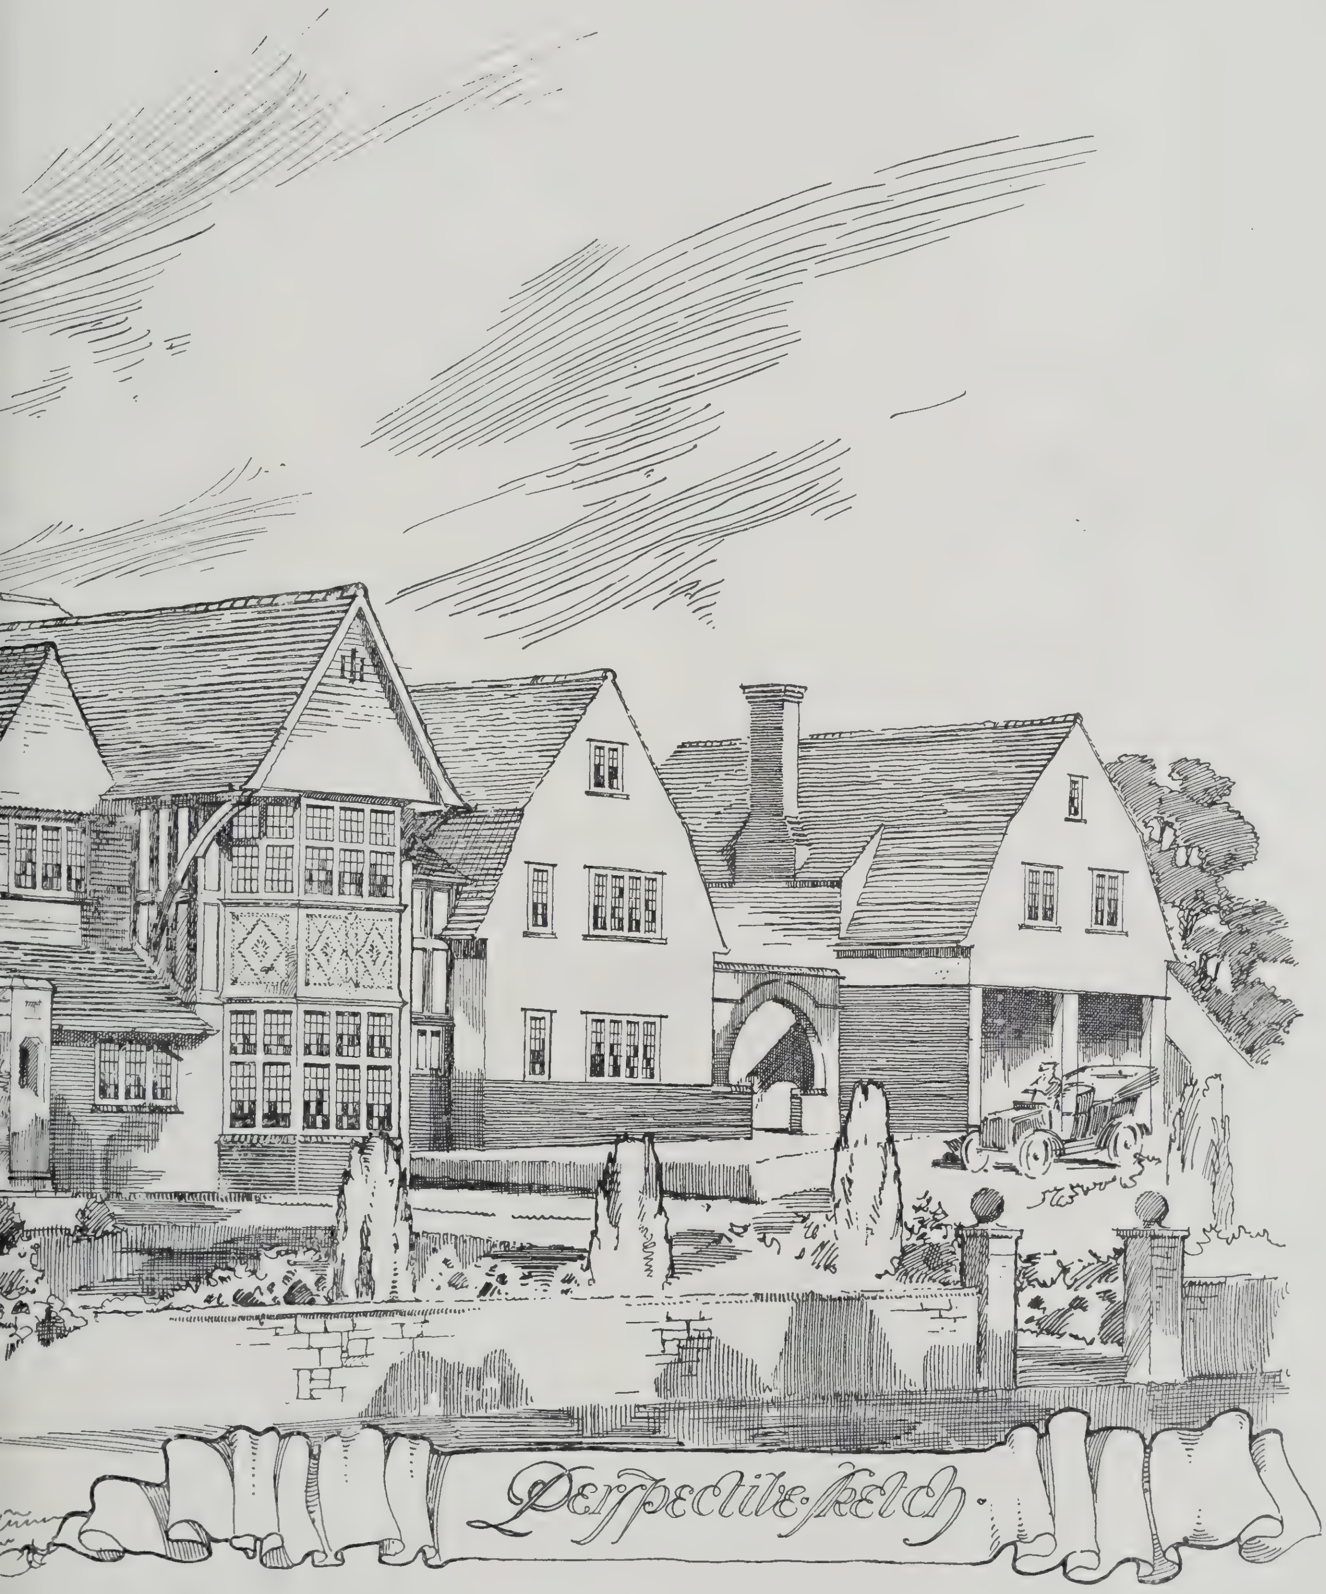
The Association of Master Painters in Scotland state, in their recently presented annual report, that the membership stands at 207. It is stated that trade prospects are brightening.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Supplement to THE BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER. *Wednesday, March 3rd, 1909.*



RESIDENCE, HENDON LANE, FINCHLEY,



BENNETT AND STRATTON, ARCHITECTS.

Our Plate.

Residence for G. Monro, Esq., jun., Hendon Lane, Finchley, N.

This house is now in course of erection on the Grass Park Estate, Finchley. The exterior is treated in a free style of modern domestic Gothic, with red Suffolk bricks, rough plaster, half-timbering and weather tiling, and the roof is laid with hand-made sand-faced tiles. Adjoining the servants' wing is a large motor house, with accommodation for three cars, with the chauffeur's quarters over. The main features of the interior are lofty and spacious reception rooms. On the west side overlooking the garden are the dining room, with walls panelled to the ceiling with richly carved and moulded walnut, and the music room, with a dark oak dado and a musicians' gallery. The drawing-room, which lies towards the south east, has a large bay window and inglenook. All these rooms are laid with woodblock flooring. The hall, which goes right through the house, is paved with black and white marble squares, and the walls are panelled. The outer hall is taken up the two storeys with arcaded gallery on the first floor. The main portion of the house is heated by hot-water pipes and radiators, by Grossmith and Co., of Southsea; and the house is wired throughout for electric light and intercommunication telephones, by Francis Vere and Co., of Finchley. The contractor is Mr. William Tout, of Brent Street, Hendon, and the architects are Messrs. Bennett and Stratton, Finchley.

Obituary.

We regret to record the death, at his house in Didsbury, Manchester, of Mr. James Brotchie Peace, after a comparatively short illness, at the age of 63 years. Mr. Peace was one of the founders of the firm of Messrs. Peace and Norquoy, builders, contractors and shop fitters, of Manchester, with whom he was associated for about 38 years. He was the patentee of the well-known folding partition, many thousands of which have been fixed. He was a prominent member of the Manchester, Salford, and District Building Trades Employers' Association.

HOUSE AT NEW MALDEN, SURREY.

The exterior of the house in Selwyn Road, New Malden, is carried out in white roughcast, and the roofs are covered with red sand-faced tiles. The external painting is of an apple-green colour, with the exception of the porch, which is of Oregon pine, stained with dark brown Solignum. Internally, a feature is made of the hall, which is lighted by a stained-glass window by George Wragge, Ltd. and is panelled to match the panelling of the staircase. All details have been studied with due respect to simplicity and economy. The builder for this work was Mr. E. D. Hobbs, Thames Ditton. The architect was Mr. Harold Kemp, of 29, Malden Road, New Malden.

Correspondence.

Puzzolana.

To the Editor of The Builders' Journal.

Sir,—Mr. J. H. Markham, in his paper on "Reinforced Concrete," read before the Architectural Association, is reported to have said: "Since Roman times, builders have not had the advantage of using such an excellent material as pozzolana, and concrete almost dropped into disuse."

Pozzolana, or puzzolana, mixed with blue lias lime, was used by Smeaton for the mortar for building Eddystone lighthouse, and it was specified in Government contracts to within the last fifty years.

At Chatham dockyard extension works, in 1867, it was specified to be used mixed with Roman cement, for all mortar below high-water mark.

T. P.

London, S.W.

LONDON MASTER BUILDERS' ASSOCIATION.

Annual Dinner.

The annual dinner of the members of the Association and their guests took place on Wednesday, February 14th, at De Keyser's Royal Hotel, Victoria Embankment, the attendance numbering about 130. Before the dinner, a reception was held. Mr. Wm. Lawrance, the president of the Association, occupied the chair, and was supported by Mr. J. Carmichael, J.P., president of the Institute of Builders; Mr. Walter Cave, F.R.I.B.A., president of the Architectural Association; Mr. F. L. Dove, L.C.C., past-president of the London Master Builders' Association; Mr. J. Randall, also a past-president of the L.M.B.A.; Mr. John W. Simpson, V.P.R.I.B.A.; Mr. G. L. Gomme, clerk of the L.C.C.; Mr. W. Shepherd, past-president L.M.B.A.; and Mr. Arnold E. Harris, J.P., F.S.I. president of the Quantity Surveyors' Association.

The loyal toasts having been duly honoured,

Mr. J. Carmichael, J.P., president of the Institute of Builders, proposed "The Architects and Surveyors." That the toast was both comprehensive and important, he was sure they would all agree. It was comprehensive because it embraced many of the ablest and most talented men of the time. Taking into consideration the high standard of efficiency to which the two professions had attained, and after some twenty-five years' almost daily experience of many of the leading architects and surveyors of London one formed the highest opinion of their ability and integrity. The duties of an architect to-day were much more difficult than they had ever been. Not only must he be an architect in the ordinary acceptation of the term, but he must have knowledge of many other subjects. In the first place, his client would ask his advice as to the value of the land, and as the building progressed, he would be supposed to know something about electricity, lighting, sanitation, hydraulics, engineering, and innumerable other subjects appertaining to building. So far as the architect was concerned, however, if he did not know all, he turned to the quantity surveyor, and whilst a certain amount of ignorance might be tolerated on the part of the architect, it was simply unheard of on the part of the quantity surveyor, whose business ability was hard to be surpassed.

Mr. John W. Simpson, F.R.I.B.A., V.P., R.I.B.A., said that in the absence of Mr. Ernest George, the pleasing duty devolved upon him of thanking, on behalf of the architects, the gathering for the reception of the toast. He could only confess that although it was perfectly true they did not deserve the nice things which had been said about them, it was certainly true that they ought to. It was pleasant to congratulate themselves upon the cordial relations between the creative and executive branches of the building trade. It was with some pride that he saw the absolute confidence placed in the architect by both parties to a building contract, and he felt that pride because he believed it was honestly justified. Although the architect was engaged in the interests of the employer, it was an accepted axiom that he would hold the balance level between both parties, and see that the builder as well as the employer suffered no wrong. He could look with no satisfaction upon executed work which had resulted in loss to the builder through no fault of his own. It was part of his duty to let him make a profit on honestly executed work. Trade was not so good as one could wish it to be. He thanked heaven that he was no politician and need not add the apple of discord to the dessert by voicing the virtues or vices of fiscal reform. But it was not often that one had the chance of addressing an assembly of the princes of the building trade, and now that their great courtesy compelled them to listen to him, he proposed to take a mean advantage and introduce an unpleasant subject. He meant, of course, the London County Council. They were at it again, they were indeed, and it was the usual thing, "an Omnibus Bill, full inside and out." It was extraordinary to note the tendency of official departments to straddle out and try to obtain more power and more work when already they possibly had more work than they could do. For instance, the Building Act of 1905 filled the mouths of the officials with more than they could digest but they now wanted more stringent powers, and were working in the face of the expert opinions of architects, builders, district surveyors, and engineers. The harassing and constantly increasing restrictions and vexatious regulations were acting injuriously upon the trade. When he heard politicians complain of the House of Lords, he was absolutely petrified by their ingratitude. They ought to thank God they had the House of Lords, and not the London County Council to deal with. The R.I.B.A. was fighting tooth and nail to obtain more moderate provisions, and in this new Bill he hoped they would have the active support and assistance of every master builder. The whole system of regular building in London was founded on a basis of fallacy. If the Building Acts were remodelled on the simple principle of specifying what might not be done, they might be of some value, but now they were pure nonsense, and the means of harassing those desirous of constructing buildings in the best possible manner. He made no complaint about the district surveyors or officials, but he did attack the Building Acts, and all their off-shoots. Solomon summed up the whole art of building when he said "Through wisdom is a house builded, and by understanding it is established."

Mr. Arnold E. Harris, J.P., F.S.I., president of the P.S.A., who responded for the surveyors, said he could not help thinking when Mr Carmichael so genially referred to the architects and surveyors, that architects might design and design, and draw and draw, and quantity surveyors might measure and measure, and bill and abstract; after all, where would they be without the builders? Therefore, he considered that the toast being proposed by the president of the Institute of Builders added very materially to the honour conferred upon the architects and surveyors, and he was glad to be able to express his own and his colleagues' appreciation of the honour. It was a source of great satisfaction that the relationship between builders and quantity surveyors was so cordial. There were very few instances in which the relations were other than cordial, and that he ventured to think was a real testimony the the fairness and impartiality of the surveyors. When they considered that in most large contracts the surveyor was appointed without any reference whatever to the builder—and most of those present would recollect that in the old days that was not so—because on many important occasions builders had a voice in the selection of the surveyor—he drew the conclusion that such cordial relations were a testimony to the general fairness and impartiality of surveyors as a body. His association was only a juvenile association, but everyone would agree that it had a very laudable object in view, viz., not only to educate the young surveyor, but to raise the status of the profession and improve the basis on which builders' contracts were founded by making it as near as possible an exact science, and eliminating all sporting items, so that the bill quantities should represent the actual work to be done in the building. He was sure that their objects in this direction would always meet with the cordial goodwill of the London Master Builders' Association, and with the co-operation of its members in every possible way.

Mr Walter Cave, F.R.I.B.A., president of the Architectural Association, next proposed the toast of the evening, "The London Master Builders' Association." He did not think the excellent work that had been done by the Association was generally known.

They worked very quietly, but they worked extremely well. It was thirty-seven years since the association was formed, and if he might recall the fact, it was brought about on account of the strikes in those days amongst the men. The very powerful unions and combinations then existing made it necessary that the masters, or employers of labour, should defend themselves against those powerful corporations. Therefore the whole inception of the society was its own protection. That had been the policy throughout, not aggression, and he believed that without statutory powers of any kind they had taken a great deal of work on their shoulders in the matter of the Conciliation Board. When a body of busy men took such a heavy burden on their shoulders, it showed that it was for the good of the whole building trade, and he thought they were very much to be congratulated in that they had already been successful in many instances in settling differences of opinion between masters and men. Without such settlement any building operations worthy the name could not possibly be carried on. He believed that during the past year there had only been one case brought before the Conciliation Board; that might be a matter for congratulation, but on the other hand, it might be an indication of the somewhat depressing times through which they were all passing. Mr. Simpson had referred to the amount of legislation that had been going on lately, and he thought it was a matter for regret that so much attention had been drawn to the details of their calling.

In responding to the toast, the president (Mr. Wm. Lawrance) said that in regard to the legislation of the London County Council in the matter of the County Council Powers Bill, which had lately been very much in evidence, he could only say that their Institute had been represented at several conferences in association with the R.I.B.A. and other institutions, and they had been very ably represented by Mr. James Carr, president of the Institute of Builders. With regard to the work of the association, he was glad to be able to report that their relations with the men had been friendly during the past year—possibly because of the depression in trade, but not wholly for that reason, because it was one of the principles of their association to consider all the relations between masters and men, and one of the great institutions necessary for that purpose had been the establishment of the Conciliation Board. There had been only one or two opportunities to meet the men, but even one was of importance, because then they considered their relations with the men, and at the same time were able to maintain and assert the principle for which they existed, viz., to maintain their right to carry on their business in their own way. With regard to the principle of their institution, they were not aggressive. They sought to establish and maintain proper, honourable and satisfactory relations between the men and themselves, and as an institution they honourably adhered to the laws made between masters and men. He thought if anything was to be said on that point, the London Master Builders' Association stood for absolute integrity; and having made proper and honourable arrangements with the men, they strove to carry them out. It was common knowledge that very great influence was brought to bear upon members of Parliament in the interest of labour organisation. It had been the duty, not only of their association, but the National Federation and other institutions, to watch carefully the Parliamentary Committees, and all measures affecting the trade, and in every respect to safeguard the interests of the builders, not only of London, but of England. He would express their indebtedness for the hard work given in defence of the right of the builders of the whole country, many useful opportunities having arisen during the year for the work to be performed. At the last meeting, Mr. Dove gave a very optimistic report upon the new premises to be taken by the association. He much regretted to say that Mr. Dove's forecast had not been fulfilled, and they were still without a home, except that at 31, Bedford Street. The negotiations for premises in Kingsway proved abortive, and other attempts came to nothing. He appealed to all present, and to all with influence in the building trade, to support their association. It had done splendid work during the thirty-seven years of its existence, and he thought there was no time more opportune than the present for them to remember that "union is strength." It was absolutely certain that there was now an opportunity for the whole interests of the building trade to be bound up together in one bundle, and he earnestly appealed to them all to support the associations so that if bad times came again they could fight the battles with great strength and vigour. He hoped the result of that night's gathering would be to create a new interest in the association, to enrol new members, and to consolidate the work which had progressed during so many years. Finally, he desired, on behalf of himself and the association, earnestly to congratulate their secretary, Mr. Costigan, on the great and good services he had rendered to the association during the past year. Their earnest and sincere thanks were due to Mr. Costigan.

The next toast, "Our Guests," was proposed by Mr. Ernest J. Brown, president of the National Federation, and past president of the L.M.B.A. He said they had already toasted some of the number, as architects and surveyors. They loved architects and surveyors sometimes, but there were others for whom they had affection, because they rendered them assistance in carrying on the trade of the great city. The great thing was that those visitors gave them credit; it was not very difficult to obtain, and they always seemed willing to give any amount of credit, and did not ask too many questions. Having given some humorous instances of hospitality extended to guests, Mr. Brown asked the visitors to assist the building trade by pulling down their palatial residences and having them re-erected. He would suggest they should never ask anyone to tender for a job who was not a member of the Builders' Association, as by so doing they would leave out those who reaped the benefit of the organisation throughout the country, but who never contributed a sixpence or a word towards the association or the National Federation of which he was president. With the toast he begged to associate Mr. Gomme, of the London County Council. He know perfectly well that Mr. Gomme was a friend to builders; he was a courteous gentleman, and all would agree that he was the right man in the right place.

Mr. Gomme said that he felt quite sure, in returning thanks for the guests on that memorable occasion, that every one of them except his unfortunate self, had enjoyed himself heartily. He had been reminded that there was such a thing as a Building Act. Well, he happened to be somewhat of an historical student, and he had read a Building Act passed in the reign of King Stephen. Builders were not allowed to do all kinds of things in that reign which they could do in the present reign, and it had to be remembered that the object of the present day legislation was to effect something useful to the community. He would venture to point out that legislation was not aimed at members of an association like the London Builders' Association, who were banded together in order to do the best they could for their profession, but rather it affected the weaker links of the chain. In rebuilding that great city of London—and it was being rebuilt — the London County Council did want to see it rebuilt in such a way that in sixty or a hundred years hence it would not have to be destroyed again, but built for all time, and be held up as an example to the rest of the country, both for its building and its planning. He was very ambitious for the good of London, and if the building and kindred professions would assist the Council in bringing about necessary reforms and in improving the weakest links of the chain, they would produce in the near future a London of which they would all be proud.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Duodecimally Divided Slide Rule.

FALMOUTH.—E. R. writes: "In the last paragraph of an article by Mr. A. E. Fletcher in 'The Builders' Journal' of February 3rd, mention is made of a duodecimally divided slide rule. I presume this is an instrument for squaring dimensions in feet and inches. If so, will you kindly inform me where such an article can be obtained, and its probable cost?"

The duodecimally divided slide rule invented by C. Hoare, which I have, is a very old one, and bears the name of Aston and Mander, 25, Compton Street, Soho, W. I am not aware whether these can still be obtained, but a slide rule with a duodecimally divided scale has been recently brought out by Mr. A. G. Thornton, of Manchester, the price being, I believe, about 4s.

ALAN E. FLETCHER.

Frontage Line Question.

HERTS.—M. writes: "An urban district council rejects plans of alterations and additions because the proposed addition projects beyond a straight line between front main walls of buildings to right and left. The frontage line—i.e., road edge—is not straight, but convex, and the distance from the front of the proposed addition to the boundary of the opposite property is 50ft., while the forecourt to property dealt with will be about 12ft., and that of property opposite 5ft. There is a by-law that the width of road shall not be less than 40ft. from the front of the proposed building to the opposite boundary. In the event of the council continuing to refuse, what steps could be taken to compel them to give the written consent necessary under the P.H. Act? Have such steps been taken frequently or successfully in such cases? Otherwise, is the game worth the candle, the improvement value to the property being but moderate?"

The statutory law upon this subject is practically all embodied in section 3 of the Public Health Act, 1888, and that clause has been frequently quoted *in extenso* in these columns. There is nothing in the Act to say that a straight line must be drawn from the front wall of adjoining house to that of the house on the other side—a curved line in consonance with the curve of the street may very fairly be adopted under the circumstances you describe. If, however, the urban district council in your case will not agree to this, I do not think you will be well advised in attempting to force their hands; they are entrusted with discretionary powers, and may refuse to exercise them if they so choose. I believe your only course of action at law will be by making an application to the High Court for a "mandamus" calling upon the council to show cause why they refuse to pass the plans, but I do not consider the "game would be worth the candle," as the French proverb expresses it.

F.S.I.

Sichel Size.

BANBURY.—SANITAS writes: "Do any of the experts on your staff know anything of Sichel size, which is said to be three times as strong as ordinary size, and to possess the advantage of not requiring heating?"

Sichel size has been used by the writer on many occasions, and he has nothing but praise for it. It is a vegetable size of great strength, quite odourless, and it dissolves in cold water, and mixes well to form distemper. It is very valuable for preparing whitewash, distemper, etc.; in fact, it is in every way much better than ordinary size, which is, of course, of animal origin. In appearance it is white, almost like milk. It is manufactured by Leo Sichel, 93, Aldersgate Street, London, E.C., and I advise you to get a sample and experiment with it. The same firm make a paste based on the Sichel size, which is exceedingly strong, and keeps sweet almost indefinitely. J.

Tithe Rent Charge on Building Land.

SOUTH-EASTERN COUNTIES.—TITHE BARN writes: "Various properties were purchased by a corporation, under powers granted by Act of Parliament, for street improvements. The lands were subject to a tithe rent charge. Frontages were set back, boundaries re-arranged, and plots sold for building. A new street was made over part of the land. (1) Are the present owners of the land (corporation or those who purchased from them) liable for tithe in proportion to the areas held by them, so that the total amount received by the tithe owner is the same as before, but redistributed? (2) Is the tithe payable whether land is in use or not? (3) Must the corporation commute the tithe for the land now dedicated to the public in the form of roads, or can they evade payment? Doubtless the existence of the charge was taken into consideration when they purchased, and they may be assumed to have paid so much less for the land as would allow of their paying now for commutation."

(1) No; each owner is liable to pay to the tithe owner the whole of the awarded amount, the receiver of the tithe rent charge having no right to constitute himself an apportioner. Should any one owner be thus called upon to defray the whole of that rent charge, he has a right to recover a proportion of it from each of his fellow landowners. The usual procedure in such a case as this is that the tithe owner should collect his full quota from the largest individual owner, but there is no law to compel him to do so, and he may claim it from any one of the owners he chooses. (2) Yes. (3) The corporation cannot be compelled to commute the proportion which would fall due as a fair share upon their roads, but they must pay their proportion of the annual charge in the same way as any other owner. Your argument as to the lower price because of this outgoing, holds good not only against the corporation, but against the persons to whom they subsequently sold land. It is possible for any of the owners to apply to the Board of Agriculture for a reapportionment of these tithe rent charges, provided that in no case can a sum of less than five shillings be charged upon any one plot; if the plots are of a smaller value than that sum the Board may direct that each person should redeem his proportion of the rent charge. You will find full information on this question in Mitchell's "Rates and Taxes," published by Effingham Wilson, Threadneedle Street, E.C., at 3s. 6d. F.S.I.

Liability for Quantity Surveyor's Fees.

WALES.—G. H. writes: "I took instructions from a client, gave sketch designs, complete working drawings, details, and specification of a house costing about £1,200. I sent the drawings to a young quantity surveyor, whom I knew to be excellent at his work, and who asked to do my quantities at 1 per cent. Am I personally liable to the quantity surveyor?"

Unless you can very clearly show that you gave instructions to the quantity surveyor as agent only for your client, there is no doubt that the full liability for his fees will fall upon yourself. F.S.I.

By-laws and Sanitation.

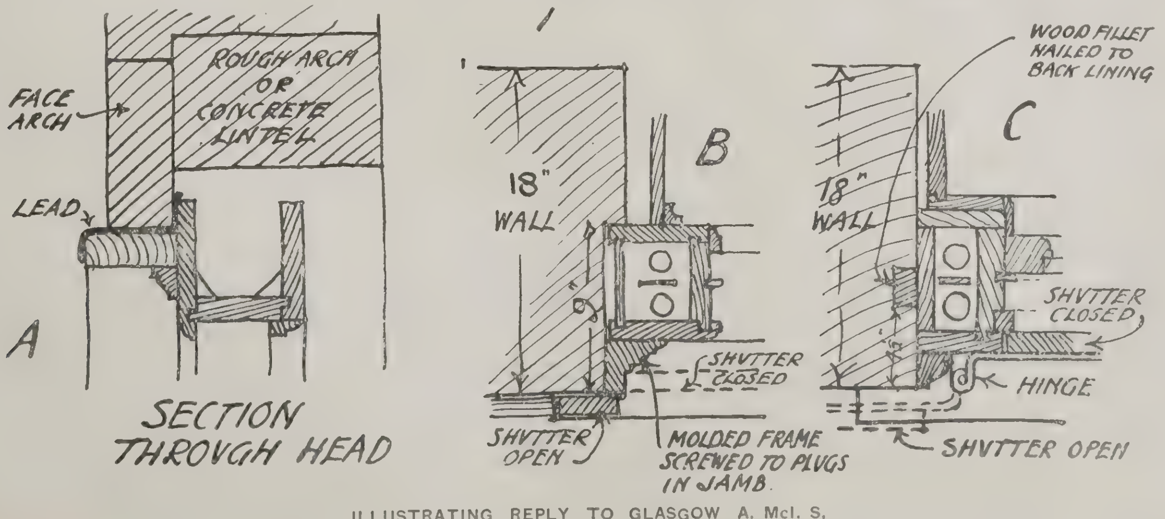
PROVINCES.—E. J. B. writes: "Plans were deposited with an urban authority for forming a new w.c. and lavatory within the building of a large hotel. The urban council refused to pass the plans, and the medical officer of health and surveyor inspected the premises and condemned the whole of the sanitary fittings and drains, and called upon the owners to instal a new system. The owners are willing to meet the council as far as possible, but many difficulties are present. There is no proper system of sewers in the town, but there are main drains into which, in a few cases, crude sewage is discharged, and also the overflows from cesspools are carried. These drains discharge ultimately into the river, but are undoubtedly public sewers, as defined by the P.H. Acts, and have been so long before the creation of the urban authority, as sewage has been directly carried into them from time immemorial. The owners are willing to do all possible to meet the urban council, but it is impossible to comply with the by-laws with respect to the cesspool; the confines of the property will not permit a new cesspool to be constructed the prescribed distance away. Can the urban council cut off the present drains directly connecting with their sewer without providing other facilities for getting rid of the sewage?" [Sketch enclosed, but not here reproduced.]

(1) No; the sanitary authority must acknowledge that any conduit taking the sewage away from two or more premises, "not within the same curtilage," is a sewer, and no resolution or determination of the urban district council can alter their legal responsibility for a sewer, however it originally came into being. (2) Yes; provided that such a w.c. is otherwise in accordance with the local by-laws. If you are likely to get into a difficulty with the council, I advise you to consult a solicitor before the case goes any further. Generally, there is no doubt whatever that the sanitary arrangements, as shown on your sketch, are very obsolete, and should be amended at once—the long lengths of soil pipe laid inside the building are particularly objectionable. W.c. No. 1 should be turned round and be furnished with a proper soil pipe, drain and intercepter, outside the building, and discharging into the sewer near the front angle of the hotel. I should also consider it to be very desirable that the existing cesspool should be abolished and a direct connection be made to the sewer—it is much too near to the building now. Proper interceptors should be put in every drain, before it leaves your premises, to prevent the passage of sewer gas back from the sewer. F.S.I.

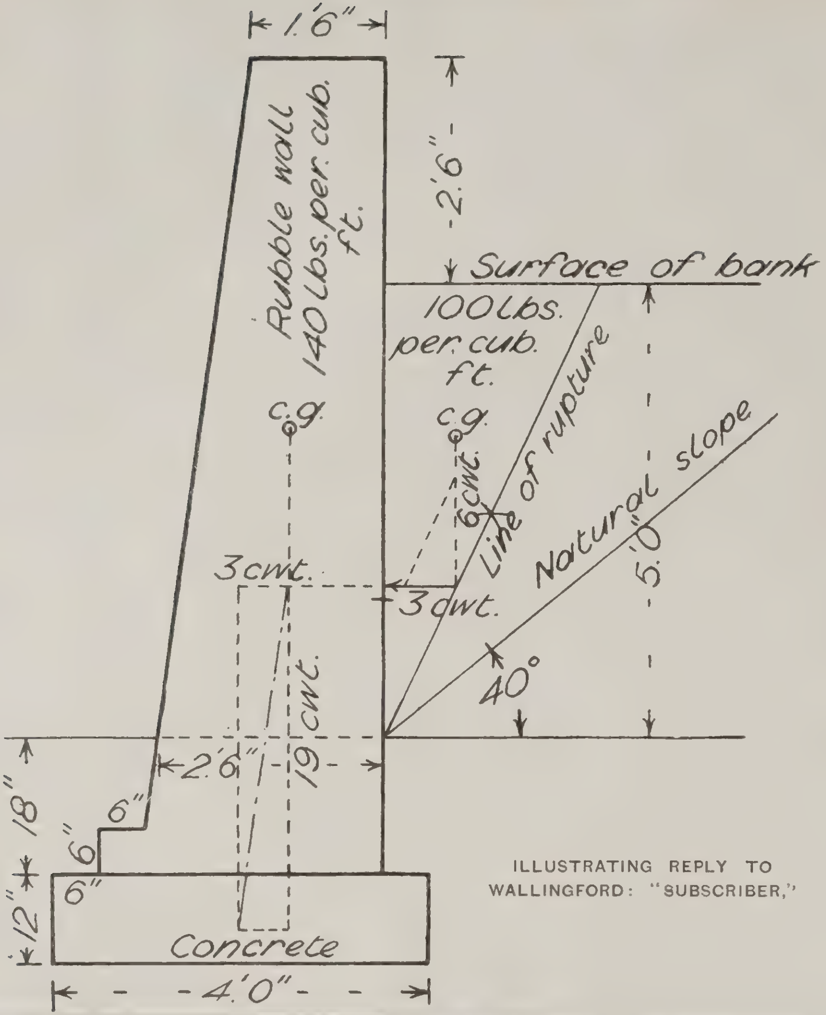
Arranging Double-hung Sashes.

GLASGOW.—A. McI. S. writes: "Kindly advise as to the best method of arranging double-hung sashes with shutters, after the manner shown on accompanying sketches [see illustration], whereby there would be the least possible chance of water coming in, while the desired effect of having the cases to show in the form of white architecture round the window opening would not be destroyed. I also send sketch of section through main cornice of house, with window sashes immediately below, and should be glad to have the benefit of your experience as to the best treatment for making a satisfactory job. The type of house I purpose building is similar to a Georgian house illustrated in Mr. Ernest Newton's book of 'Country Houses'—a large brick house with shuttered windows."

Exposed cased sash frames are most frequently built into straight reveals without any check whatever, but in this instance, owing to the very exposed position, it is probably wise to provide one, and the form you show should prove quite satisfactory except in the case of heads of windows not covered by the cornice. Presumably, these windows have gauged face arches; in this case the best means of protection would be a strip of lead as shown in sketch A. If the frames are built in, it will be a simple matter to arrange for this leadwork, but if they are put in after the work is up, the lead must be placed in position on the arch centre before the arch is built. The Georgian frames did not usually set so far back as 4½ins. from the wall face. Alternative plans through jambs are given in sketch B and C—the latter an American plan; with both of these the frame approaches nearer to the wall face, and a single wood moulding is sufficient to cover the brick reveal. Outside shutters are usually hung with parliament hinges, screwed to the sash frame, but I do not recommend them, and either of your suggestions is preferable. The section through eaves is quite practicable, but it might be suggested that beam filling raised from concrete lintel to the underside of the roof boarding would be an improvement. G.



ILLUSTRATING REPLY TO GLASGOW A. McI. S,



ILLUSTRATING REPLY TO WALLINGFORD: "SUBSCRIBER,"

Rubble Stone Boundary Retaining Wall.

Wallingford.—Subscriber writes: "Please advise as to the strength of the wall of which particulars are enclosed." (Of insufficient general interest to warrant reproduction.)

It appears in this case that a rubble stone boundary wall with concrete core is required to act in places as a retaining wall to a bank of earth 5ft. high. No description is given of the nature of the earth to be supported, or of that upon which the wall rests, so that average conditions must be assumed to exist. Taking the section of wall to be as shown in the accompanying illustration, the resultant thrust, found graphically as shown, cuts the ground level at the centre of base, and the maximum stress will be $\frac{W}{A} = \frac{19}{2\cdot5} =$ 7.6 cwt., or 0.38 tons per sq. ft. compression. Two courses of footings, 6in. deep, with 3in. projection, may be substituted for one course with 6in. projection if preferred. It is not desirable to have two different mixtures for mortar in the same wall; lias lime may be used throughout. It can be built in 60ft. lengths, racked back as proposed. The stones below ground may be rough, but should be solidly bedded in lias mortar. The concrete may be reduced to 9in. if the bottom is good, but 12in. is better.

Henry Adams.

Property in Old Materials.

Hereford.—H. S. writes: "Repairs having been executed at certain old premises, the contractors carted away the old material. The proprietors demand its return, but the contractors hold that as there was no mention of the matter in the contract, they had a right to follow the custom of the trade with respect to old materials. Please favour me with your opinion."

The contract must have been very loosely drawn, if it neither expressly, nor by clear implication, laid the responsibility for the removal of the old materials upon the contractor. I am of opinion that the contractor was within his rights in taking away the waste material and retaining it; because it was not reserved to the employer, and no doubt the contractor would have been quite unable to do the specified work unless he did so remove the old work. I cannot say that the "custom" is so definite as you state it, but, on the whole, I think it possible that such a plea might successfully be set up in a court of law.

F.S.I.

Glass Furnaces.

Staffordshire.—Architect writes: "There are, I believe, certain firms who produce a patent melting furnace suitable for the manufacture of glass bottles. These firms are, I believe, chiefly German and American. I have the address of a firm named Siemens, but there is a firm, 'Dixon,' whose address, together with the names and addresses of a few other firms, I am anxious to obtain. Dixons erected one of their furnaces at Tutbury. Perhaps you can supply me with the information I require?"

(Can any of our readers oblige with the required information?—Ed.)

Books on Reinforced Construction.

Dinas Powis.—L.W.B. writes: "Please recommend books on reinforced concrete construction."

The best books on reinforced concrete construction are those by Messrs. C. F. Marsh and W. Dunn (either the large work at 31s. 6d. nett, or the handbook at 7s. 6d. nett), and "Reinforced Concrete Construction," by Buel and Hill, 21s. nett.

Stonework Quantities.

Cambridgeshire.—Stonework writes:—"I have a set of quantities, which includes stonework with the following heading:—'Box ground stone as described at first floor level, including all sawing and waste, rough sunk work and preparatory 'setting out' beds, joints, faces, etc. Is this the usual heading for stonework? The various labours follow, and I shall be glad to know whether these labours (including the beds and joints) would be in every case the net measurement of finished work, especially with respect to the traceried windows."

The description of the cube stone is not unusual, the labours included being all preparatory work. The labours to beds and joints, being included in the heading, will not be separately measured. In a bill of quantities where these labours are measured, they will be taken from the cube out of which the stone will be worked. Further labours are taken to include all previous labours necessary to produce them, and will be nett. The superficial area of the stone out of which the stones in tracery are obtained is measured both sides as plain work.

Calorifers or Basement Stoves.

London, S.W.—Devereux writes: "In 'Specification' for several years running, calorifiers or basement stoves, are described in detail. Can you, in your 'Enquiries' columns, give a typical plan and section of their construction, and the names of firms of repute who undertake this system of heating?"

Calorifers vary too much in their details to permit of one drawing serving for the main features of all. All the best makes have a furnace, lined with fireclay, in which the coke burns, and pipes or chambers through which the smoke travels ere it reaches the chimney. The ease of sweeping out dust and soot from the flues and of cleaning the outside surface are points to be noted when selecting an apparatus. The cleaning of the air-flues is also to be noted, though these can often be swept from the rooms down to the heating chamber. The accompanying sketch will give some idea of an installation. The following firms make and instal calorifers:—J. Langfield and Co., Manchester; Haden and Sons, Trowbridge, Wilts, and London; John Grundy (the "Heim" calorifer), Tyldesley, Lancs. and London; J. Constantine and Son, Manchester; Musgrave and Co., Ltd., Belfast and London; Crumblehulme and Co., Bolton, Lancs. There are other firms in different localities who do this work. With this and "Specification," you should be able to select a good appliance.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

AMERICAN CIVIL ENGINEERS' REPORT ON REINFORCED CONCRETE.

A special commission, appointed by the American Society of Civil Engineers to report on the subject of concrete and reinforced concrete, has recently drafted their report which, for the time being, is referred back, and will be discussed and probably amended in important particulars before being adopted by the Society. The report, when complete, should be important and worthy of close attention, for not only is the American Society of Civil Engineers a very important authority, but American engineers have had much more experience than engineers in this country, and they regard things from a more practical standpoint than is customary on the Continent or in England. The English Institution of Civil Engineers have also appointed a committee to deal with the subject of reinforced concrete, and the outcome of their deliberations will be awaited with much interest, as the Royal Institute of British Architects specially appointed committee on the same subject, which some time ago issued a report that seems to have become an accepted standard of practice. The R.I.B.A. Committee did not definitely pronounce upon rules for all details of reinforced concrete construction nor for all purposes, and their exclusion of these features was due to the fact that the scientific understanding of the minor problems of reinforced concrete design was incomplete, and that further study was desirable before coming to a conclusion in the matter. The same conservatism seems to dominate the American Commission; but though the whole of the members expressed their conviction that the laws of design have by no means been adequately determined as yet, the commission has drawn up majority and minority reports, and both alike place the question of design of reinforced concrete as in a position of progress solely. The main report consists of a resumé, without citing authorities or tests, of what its authors consider conservative present practice. The minority report states plainly that sufficient information has not been collected by the committee and incorporated in its report on which to base the details of design and methods of calculating stresses recommended by the majority, particularly as such recommendations will have much weight with the public because of the high standing of the Society. The first part of the report advocates the placing of all design work in the hands of specially experienced engineers not affiliated with contractors, giving them complete supervision, and holding them equally responsible with the contractors for the result. Such advice is not unexpected, for the American Society of Civil Engineers is mostly composed of professional men, and it is natural that they should advocate the professional point of view. The only objection to the independent engineer is that he is divorced so much from practice, and in all branches of engineering we find that many contractors employ their own designers, and that the engineering profession has a tendency, as specialisation progresses, to draw into two classes, i.e., those who are affiliated with firms of contractors or manufacturers, and those who are solely consulting engineers. The latter often do prepare designs, but it seems more and more general for them only to prepare general schemes, and to leave the detailed design to the specialist engineers affiliated with contractors. The latter method is certainly the most economical, and where it is a matter of economy we do not think the public will allow any other system to succeed. However, the pious expression of faith in the independent engineer may serve to comfort a little the professional element in the American Society, and the procedure will be settled by the public and the efficiency and fundamental economy of the varying methods of working as time goes on.

Then the American Commission proceeds to make more practical recommendations. It believes that a detailed study of the connections between reinforced concrete members is desirable, together with such designs of the reinforcement as shall preclude the possibility of displacement. Then it advocates definite tests of concrete aggregates. It urges the provision of special reinforcements to take account of shrinkage stresses, although it makes no allowance for such stresses in the assumptions it advances for the design of reinforced concrete beams. It is all very well to call attention to such a point, but it would be more helpful if some advice as to how to make such allowance were given. No doubt such stresses may be important, but it is difficult to ascertain what such stresses are and their effect, and how to guard against them. The committee recommend a thickness of 1½in. of fireproofing on monolithic concrete columns, at least a 2-in. covering over the metal of other columns, 1½in. over that of beams, and a minimum of 1in. in the case of short-span floor slabs. American opinion inclines to the belief that these recommendations err in being too conservative, for it is urged that to add to the deadweight and cost of the structure by increasing the usual fireproofing allowances on floor slabs from 10 to 30 per cent. is unwarrantable, as the effects of fire can almost invariably be easily repaired, and even a failure from fire damage will at most be local, and can do comparatively little harm. The usual provision in this country is ½in. protection for the metal in floor slabs, and this we ourselves believe to be sufficient. We are, however, with the committee in regard to a 2-in. protection for columns, and 1½-in. protection for beams, for fires and fire tests have conclusively proved that anything less is not sufficiently fire-resisting. The main supports of fire-resisting floors should be adequately protected; but the floor slab itself needs little protection, and ½in. is sufficient in our view. We cannot follow the committee in objecting rather strongly against the plastering of concrete surfaces. We cannot see any serious objections, and until some more satisfactory and economical method of finishing the surface has been found, we have no doubt that reinforced concrete floors and walls, etc., will continue to be plastered. The committee's majority report recommend various working stresses for the materials in reinforced concrete structures, but they do not give any indication of the reasoning upon which these recommendations are based. The subject is prefaced by the remark that the stresses specified may be increased up to 25 per cent. only when the best materials are employed, and only the finest workmanship is provided, and they should be reduced when concrete of less than 2,000 lb. compressive strength is used. The stresses recommended are as follows:—

Concrete.

Compression:	
For bearings	650lbs. per sq. in.
For axial compression	450lbs. per sq. in.
In banded columns ...	540lbs. per sq. in.
In columns with both bands and longitudinal rods	650lbs. per sq. in.
In bending	650lbs. per sq. in.
(With extra allowance near supports.)	
Shear:	
Pure shear	120lbs. per sq. in.
Combined shear and diagonal tension without steel, 40lbs., up to 120lbs. where full steel reinforcement by stirrups is employed.	

Steel.

Tension	16,000lbs. per sq. in.
Compression	16,000lbs. per sq. in.

These are high stresses, higher than those recommended by the R.I.B.A. committee, and it is to be doubted whether the raising of the limit is advisable for ordinary work. Trade designers will be tempted to add the 25 per cent. to them, which is recommended for the best work, and use the figures thus obtained for ordinary work. We are glad to see the opportunity given for higher stresses to be employed when proof is given that the materials can be so safely stressed, and that the design and workmanship are well done; but we think it unwise for a professional body at the present time to advocate such relaxation of the conservative figures provided by by-laws and advised by other societies. Such advocacy will only be used by unscrupulous or ignorant trade interests to sail still closer to the wind, with possible and, indeed, probable, detriment to the industry and danger to efficiency and life and limb. However, we hope that on more mature consideration the American Society will issue a report that will be more worthy of it, and a little more helpful than the majority report of its commission promises to be.

WHEELS OF REINFORCED CONCRETE.

There seems no end to the purposes to which reinforced concrete may be applied. The latest, and somewhat surprising, development is that the material has been used for the construction of heavy wagon wheels, for which patents are being taken out in the United States. A renewable steel tire is used on the outside just as is done with a wooden wheel. The rim and hub only are of concrete, the spokes being of wood, boiled in oil, coal tar or crude petroleum, to prevent the absorption of moisture and decay. The bearing in the hub for the axle is made of chilled steel to give it long wear. The advantages claimed for this reinforced concrete wheel are that it is practically everlasting, is not affected by any climatic conditions, and its cost to build is not over one-half as much as the all-wood wheel. It can be made at any spot by anyone, as there is no difficult work required in building it: all that is necessary is to set the spokes in position and pour the cement mixture into the mould.

The third general meeting of the Concrete Institute was held on Thursday, February 18th, at the Royal United Service Institution, Whitehall, S.W., Mr. Edwin O. Sachs presiding over an excellent attendance of members, among whom were the following:—Mr. Lucien Serraillier (who read the paper, of which a portion was given in last week's issue, the remainder appearing this week). Prof. Hy. Adams, M.I.C.E., and Messrs. F. E. Wentworth-Sheilds, M.I.C.E., A. Alban Scott, M.S.A., E. Fiander Etchells, G. C. Workman, J. Munro, M. Kahn, Herbert E. Brooks, E. Benedict, M.I.C.E., A. B. Jocelyn, Thos. Potter, Harold H. D. Anderson, Alexander Drew, Alfred Brooks, Alfred Fidler, E. P. Wells (hon. treasurer), and H. Kempton Dyson (secretary).

The Chairman said it was the custom to make an announcement as to the increase in the membership of the Institute. At their first meeting they had 300 members, and the second 401, and between then and this meeting they had increased to 551.

A REINFORCED CONCRETE AQUEDUCT.

By Robert S. Walker.

(*Concluded fom page 96, No. 730.*)

While the piles were being driven, carpenters worked on the forms for the tow and berm path slabs, on the eastern side. As will be seen in Fig. 10, these two slabs overhung from the two side walls of the canal, and were carried on two concrete beams, one on each slab respectively. These beams were in turn supported on an extension of the buttress and middle walls. The forms for this part of the work were erected on much the same lines as the main canal bottom. Troughs were made for the beams, and supported on 6in. by 6in. timbers. Cross pieces of 6ins. by 6ins. were run across from the cap pieces to the side walls, to carry the planking for the slabs proper.

The process of erecting the western arch was similar to that of the eastern, except in the case of the canal side wall on the tow path side. Here provision had to be made for two sluices, ways, and a spillway over the top of these. The wall was also increased in thickness on account of the openings.

The gates used were of the usual sluice type, and designed to operate vertically. They were constructed of steel plate, strengthened by angle irons riveted on the back. Bronze rubbing strips were screwed on both to the gates and guide bars, with brass countersunk screws. A rack and pinion gear was used for raising and lowering, two racks being provided on each gate. The operating mechanism consisted of two vertical shafts, with the upper ends squared, which ran down from the tow path, and engaged with the pinion shafts through worm gears. Handles fitted on to the upper ends of the vertical shafts enabled the gates to be operated from the tow path.

Owing to the delay caused by the rivers flooding, the work was so put back that the concrete in the western canal side walls had only been in a few days when the time was up. As the State wanted to refill the canal, a temporary wooden wall had to be built inside the concrete one to take the strain until the concrete had set sufficiently. This temporary wall was afterwards removed by means of a floating derrick.

The work as completed is shown in Fig. 14.

Reinforcing.

All the reinforcing in the work was of steel bars, in sizes varying from ½in. to 1¼ins.

Buttress Walls.

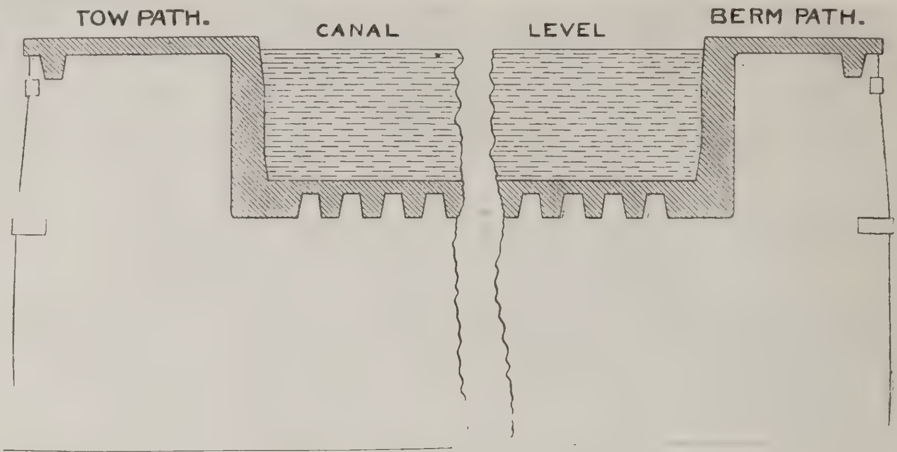
7-8ths in. bars were used in these, placed vertically and spaced 12ins. apart, every alternate bar being bent 4ft. from the bottom about 2ft. out of the straight to follow the line of the toe at the bottom of the wall. All the bars were placed about 3ins. from the surface of the outside of the wall, thus serving as tensional bars to resist the pressure of the earth filling behind.

Middle Wall.

This had no reinforcing.

Wing Walls.—Fig 11.

These were reinforced with 7-8-inch and ½-in. bars, the ½-in. bars being set vertically and spaced 12ins. apart; the 7-8-inch bars horizontally, and spaced 6ins. apart for the eight lower rows, and then 9ins. apart on the remaining. This scheme of reinforcing was placed on both sides of the walls, 3ins. from the surface.



CROSS SECTION OF AQUEDUCT.
FIG. 10.

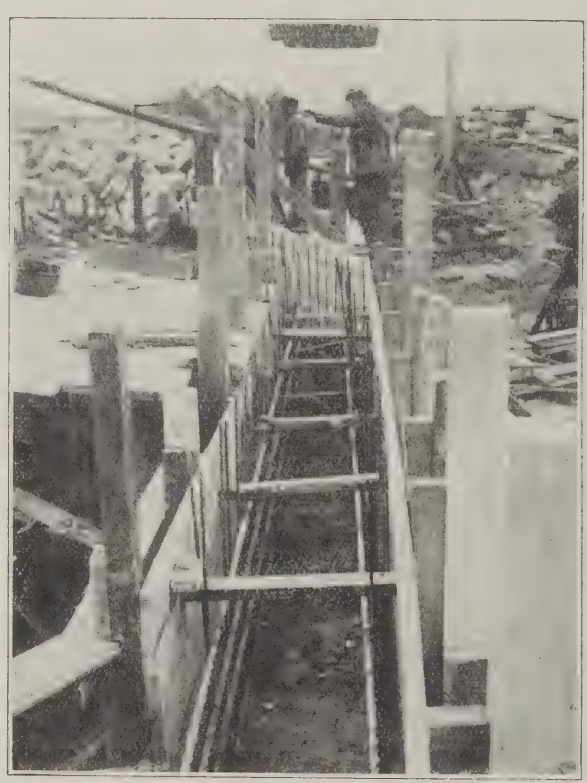


FIG. 11. VIEW OF FORMS FOR WING WALLS PARTLY FILLED, SHOWING REINFORCING BARS.

Canal Bottom.

This was formed of beams with a 12in. slab on top, monolithic with them. The beams were reinforced as follows:—Two 1¼in. straight bars were set at the bottom 2ins. from the surface, and two 1¼in. rods bent up at the ends set about 2ins. above them. Finally, a 7-8-inch bar, bent as shown in Fig. 12, was placed between these latter. The slab was reinforced with ½in. bars spaced 12ins. apart and set at right angles to the beams. These bars were set 2ins. below the surface.

Canal Side Walls (Excepting Wall with Sluice Openings.)

These were reinforced in practically the same way as the wing walls described earlier.

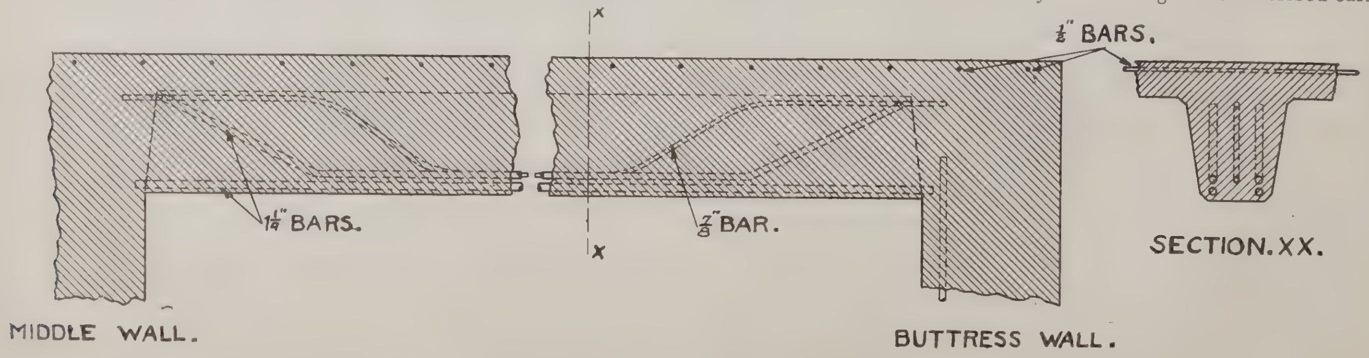

FIG. 12. SECTIONS OF BEAMS IN CANAL BOTTOM.

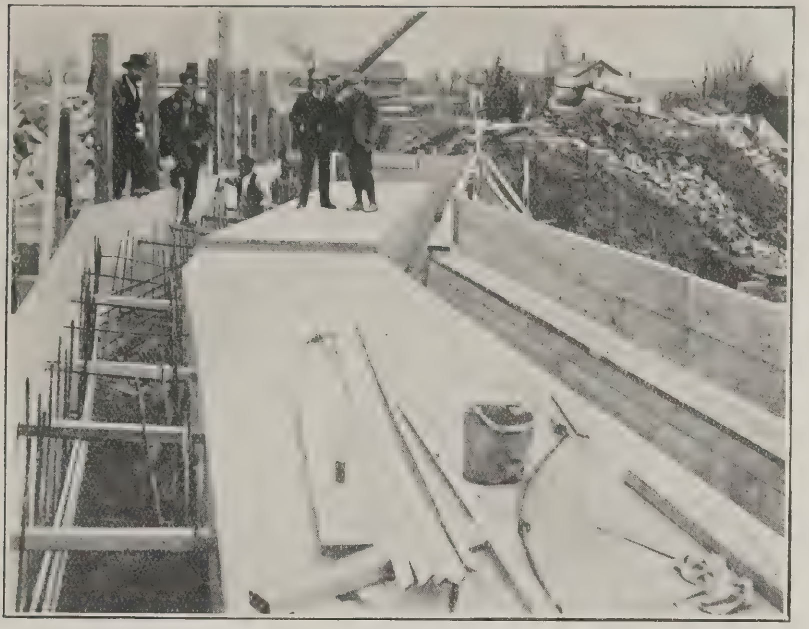

FIG. 13. VIEW OF FORMS FOR BERM PATH SLAB AND SUPPORTING BEAM, SHOWING CANAL SIDE WALL PARTLY COMPLETED

with the exception that the bottom six rows had 1in. bars.

Side Walls with Sluice Openings (Approximately 3ft. thick).

This wall, being weakened by the sluice and spillway openings, was reinforced with ½in. and 1¼in. bars. The ½in. bars were set vertically, approximately 12ins. apart. They were omitted where the openings occurred. The 1¼in. bars were set horizontally, spaced 6ins. apart. These were also omitted where the openings occurred.

Town and Berm Path Slabs (12 ins. thick). Fig. 13.

These were reinforced with ½in. and ¾in. bars. The ¾in. bars were set crossways to the path, 3ins. from the bottom surface, and spaced 12ins. apart. On top of these, ½in. bars were set at right angles to them and spaced about 2ft. 6ins. apart. Then 3ins. from the top surface ½in. bars were set crossways to the path and spaced 12ins. apart. On top of these again, ½in. bars were set at right angles to them, spaced about 2ft. 6ins. apart, and so arranged as to be staggered with the lower row of ½in. bars running lengthways with the path.

Tow and Berm Supporting Beams.

These were reinforced in practically the same way as the beams in the canal bottom, with the exception that the 7-8ths. inch bars were omitted.

Concrete Mixing Plant.

The mixing plant consisted of a two-storey covered shed, the mixers being on the ground floor. A hopper with a collapsible bottom was fitted in the floor of the upper storey with a shoot running down from it into the mixer hopper. Runways were erected to the stone and sand piles, and to the cement store shed. The stone and sand were wheeled up the runways by gangs of men with wheelbarrows, and dumped direct into the upper hopper in correct proportion for the batch. A man stood by the side of the hopper and dumped in the required amount of cement, according to the mixture required. Then the bottom of the hopper was collapsed and the contents let into the mixer. Another man operated the mixer, and took care of the water supplied to it. Immediately the upper hopper was empty, the bottom was shut, and another batch dumped into it. In the meanwhile the first batch was mixing, and as soon as it was properly mixed it was run out into the concrete dumping buckets on the derrick, swung around and put into the forms. Directly the mixer was empty the man operating it signalled to the gang above and the next batch ready in the hopper was let down into the mixer. This system worked admirably, and as many as 235 batches of ½ cub. yards were handled in ten hours.

Two Ransome mixers were installed. They were belt driven from a horizontal engine. Only one was used at a time, the other acting as a stand-by.

The erection of this aqueduct was undertaken, and, in spite of many mishaps, successfully carried out in the specified time by C. E. Parsons, C.E., of Albany, N.Y. Fig. 14 shows the work completed.

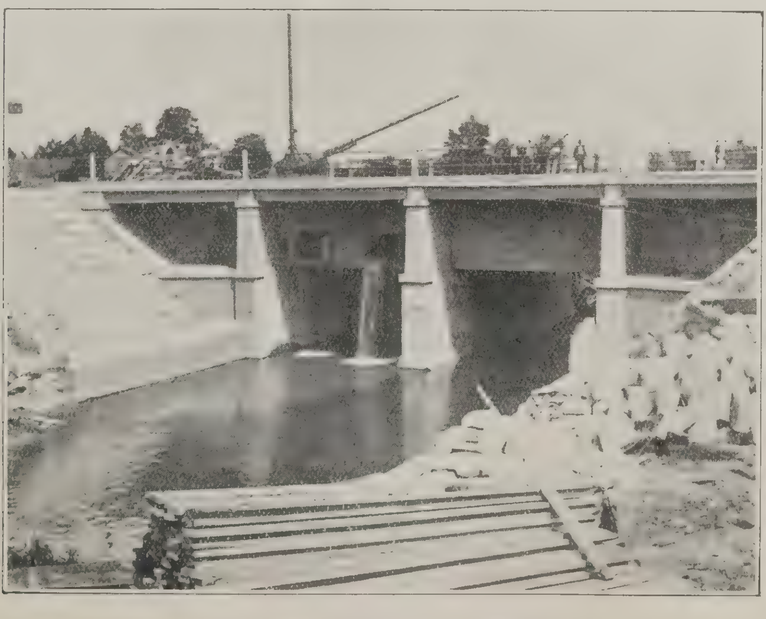

FIG. 14. NEW AQUEDUCT COMPLETED.

A LONDON STEEL FRAME BUILDING.

The Selfridge Store.

In the new building at the corner of Oxford Street and Duke Street, London, W., erected for Mr. H. Gordon Selfridge, now nearing completion, we have an example of the modern steel-frame structure which, until the last few years, was typical of the United States, but not adopted here. The Ritz Hotel was the first example of a typical steel-frame building erected in London, and at the time of its erection we gave a series of articles illustrated with many detail drawings of the steelwork, framing plans of the steelwork of every floor, and photographs of parts and of the whole in course of construction, for we thought that it was desirable for us to describe the system, new to us, of construction as fully as possible, for the benefit of the English architectural profession and building trade. That structure, designed by the same engineer as the Selfridge Store, and executed by the same contractors, was, however, not quite so advanced or so thoroughgoing a steel-frame or skeleton construction as that developed in America. It made many concessions to English tradition, and the steelwork was designed to fit an architectural plan already made and not particularly designed for the use of the steel skeleton construction. To some extent, of course, the Ritz Hotel was not quite the kind of building that lends itself to the most economical framing. In this building the first consideration was to be suitable arrangement of rooms for an hotel. The Selfridge Store was, however, from the first designed as a steel-frame structure, and schemed to make all parts work well together and secure the greatest economy. There are, of course, some points in which the structure does still not exactly use the system to utmost advantage, but that is because our London Building Act was not framed for such structures, and unduly thick walls were insisted upon.

However, the building marks a considerable advance on previous London structures, and we have therefore thought it desirable to describe and illustrate the Selfridge Store in considerable detail, first, in order to provide our readers with accurate information upon this modern method of construction; and, secondly, to afford a record of a landmark in the progress of modern building construction. With that object we have arranged for Mr. S. Bylander, the contractor's engineer responsible for the engineering design, to describe the construction in detail, and the first part of his article appears below. We illustrate in this issue some details of the steel grillage foundations, the plain and reinforced concrete retaining walls, the reinforced concrete floors, and some steelwork details, as also some photographs taken at various stages of the work, showing the construction generally, and the progress of its erection, which was very speedy. In future issues we shall publish many further illustrations of the construction. The Selfridge Store belongs to the modern type of warehouse construction, and the latest improvements, not only as regards the steelwork, but in many other directions, have been adopted. It is probably the most interesting and up-to-date building of its kind in the Metropolis.

Great credit is due to the different parties concerned for the excellent results which have been obtained, both as to beauty of design and stability and rapidity of construction. The architects are Mr. R. Frank Atkinson, F.R.I.B.A., of London, and Messrs. D. H. Burnham and Co., of Chicago. The contractors are Messrs. Waring and White (1906), Limited, whose engineering department has prepared the design and working drawings for the steelwork, foundations, and floors. It must in fairness be stated that, to the satisfactory results obtained, Mr. Selfridge has contributed more than anyone else, by his bringing into play, with unremitting energy, his great business ability and his knowledge of organising this class of work.

The building occupies a site between Oxford Street, Duke Street, and Somerset Street, the frontage to Oxford Street being about 250ft., and to Duke Street about 175ft. The entire area has been built upon, and no central court or area has been constructed. The building is designed with the object of obtaining as large rooms as possible, and is constructed on the most up-to-date methods for the prevention of fire.

It is the first building where the authorities have permitted so great cubical contents in each portion of the building; and, further, by special consent, the door openings have been made 12ft. by 12ft., thus facilitating better planning to sales rooms.

Every floor in the building will be used for sales rooms, except a portion of the basement floor, which will be used for storing material, and the third basement, which is occupied by machinery.

The flat roof is 80ft. above the street level, and the foundations are 60ft. below the street level. The total height from the foundations to the top of balustrading is 150ft.

THE CONSTRUCTION OF THE SELFRIDGE STORE.

By S. Bylander.

Steelwork.

The building is constructed as a steel frame, although the exterior walls are carried on piers, and no columns are placed in the exterior walls. The internal division walls are carried on steelwork, except the centre party wall, which is self-supporting, and also carries the floor load.

The building contains about 3,000 tons of constructional steelwork, and it may be of interest to know that it was erected at the rate of about 125 tons per week.

The contractors, Waring and White (1906), Limited, made the steelwork drawings, and also carried out the erection, and during the construction about 12,000 blue prints were in use, of which about 2,500 were 40in. by 27in. in size, not including the architectural drawings and drawings for sprinkler and heating systems, etc.

The foundations are spread by means of grillage beams, on which are resting the cast-iron bases supporting the columns.

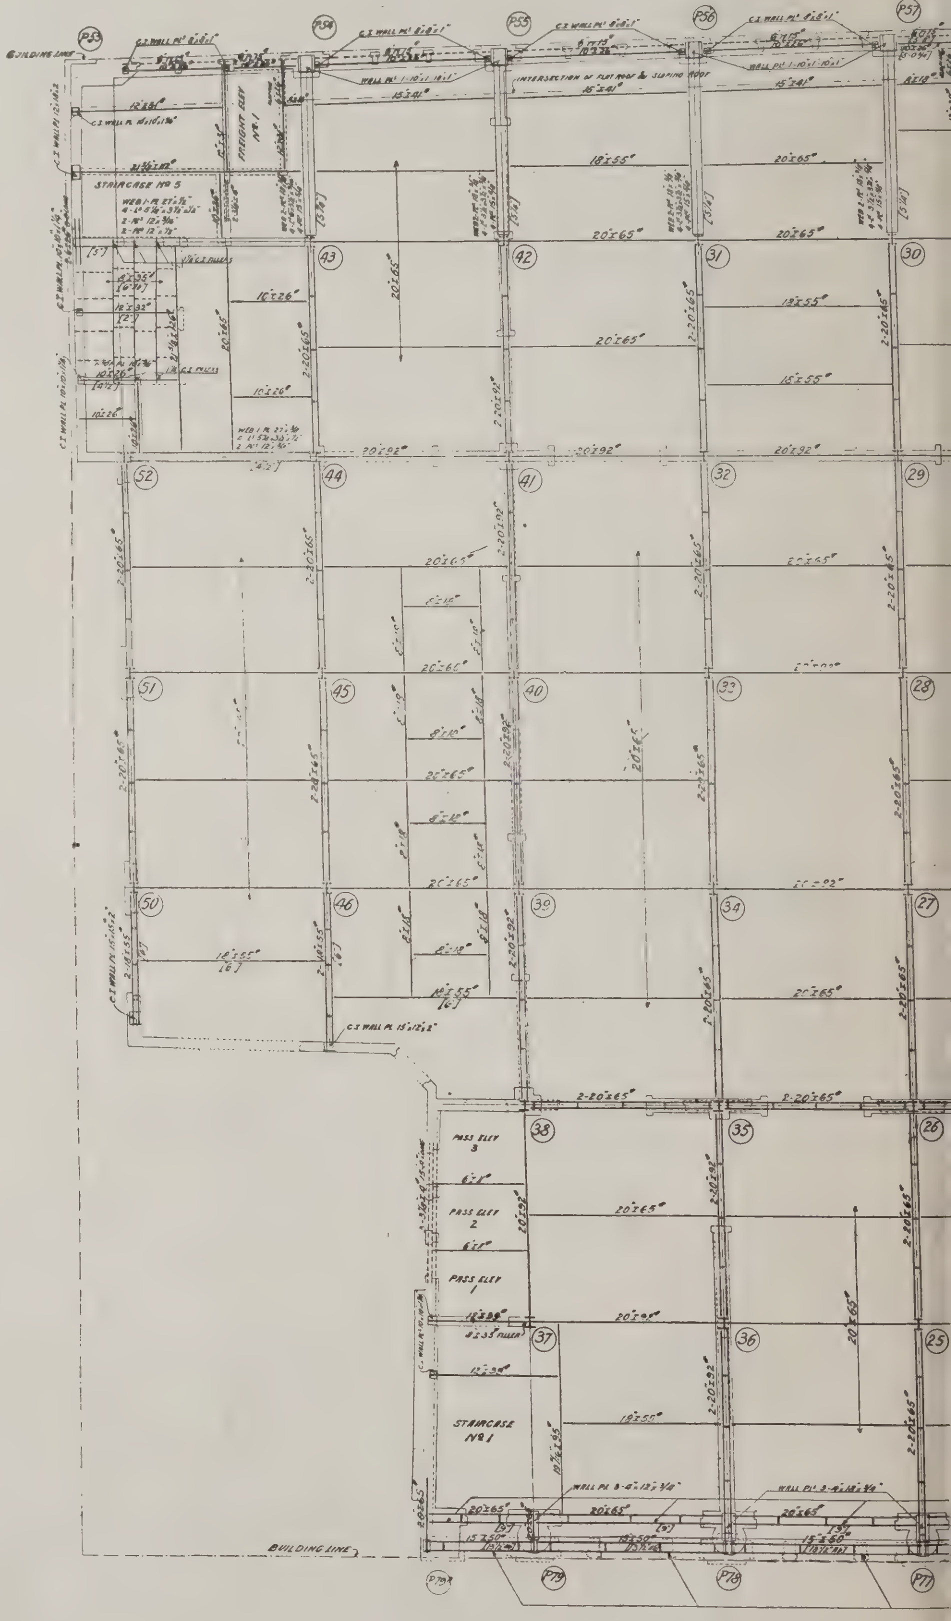
The columns are placed in straight lines parallel to Oxford Street, and the distance between them is 22ft parallel to Oxford Street, and 24ft. in the other direction, the centre lines of the columns making an angle of somewhat less than 90 degs. (87 degs.).

The panels are all alike, although slightly on the skew, great advantages being obtained by this regular setting out of the panels, minimising the possibility of errors and also the amount of details required. The columns are built up of plates and angles; rolled steel joists or channels have not been used.

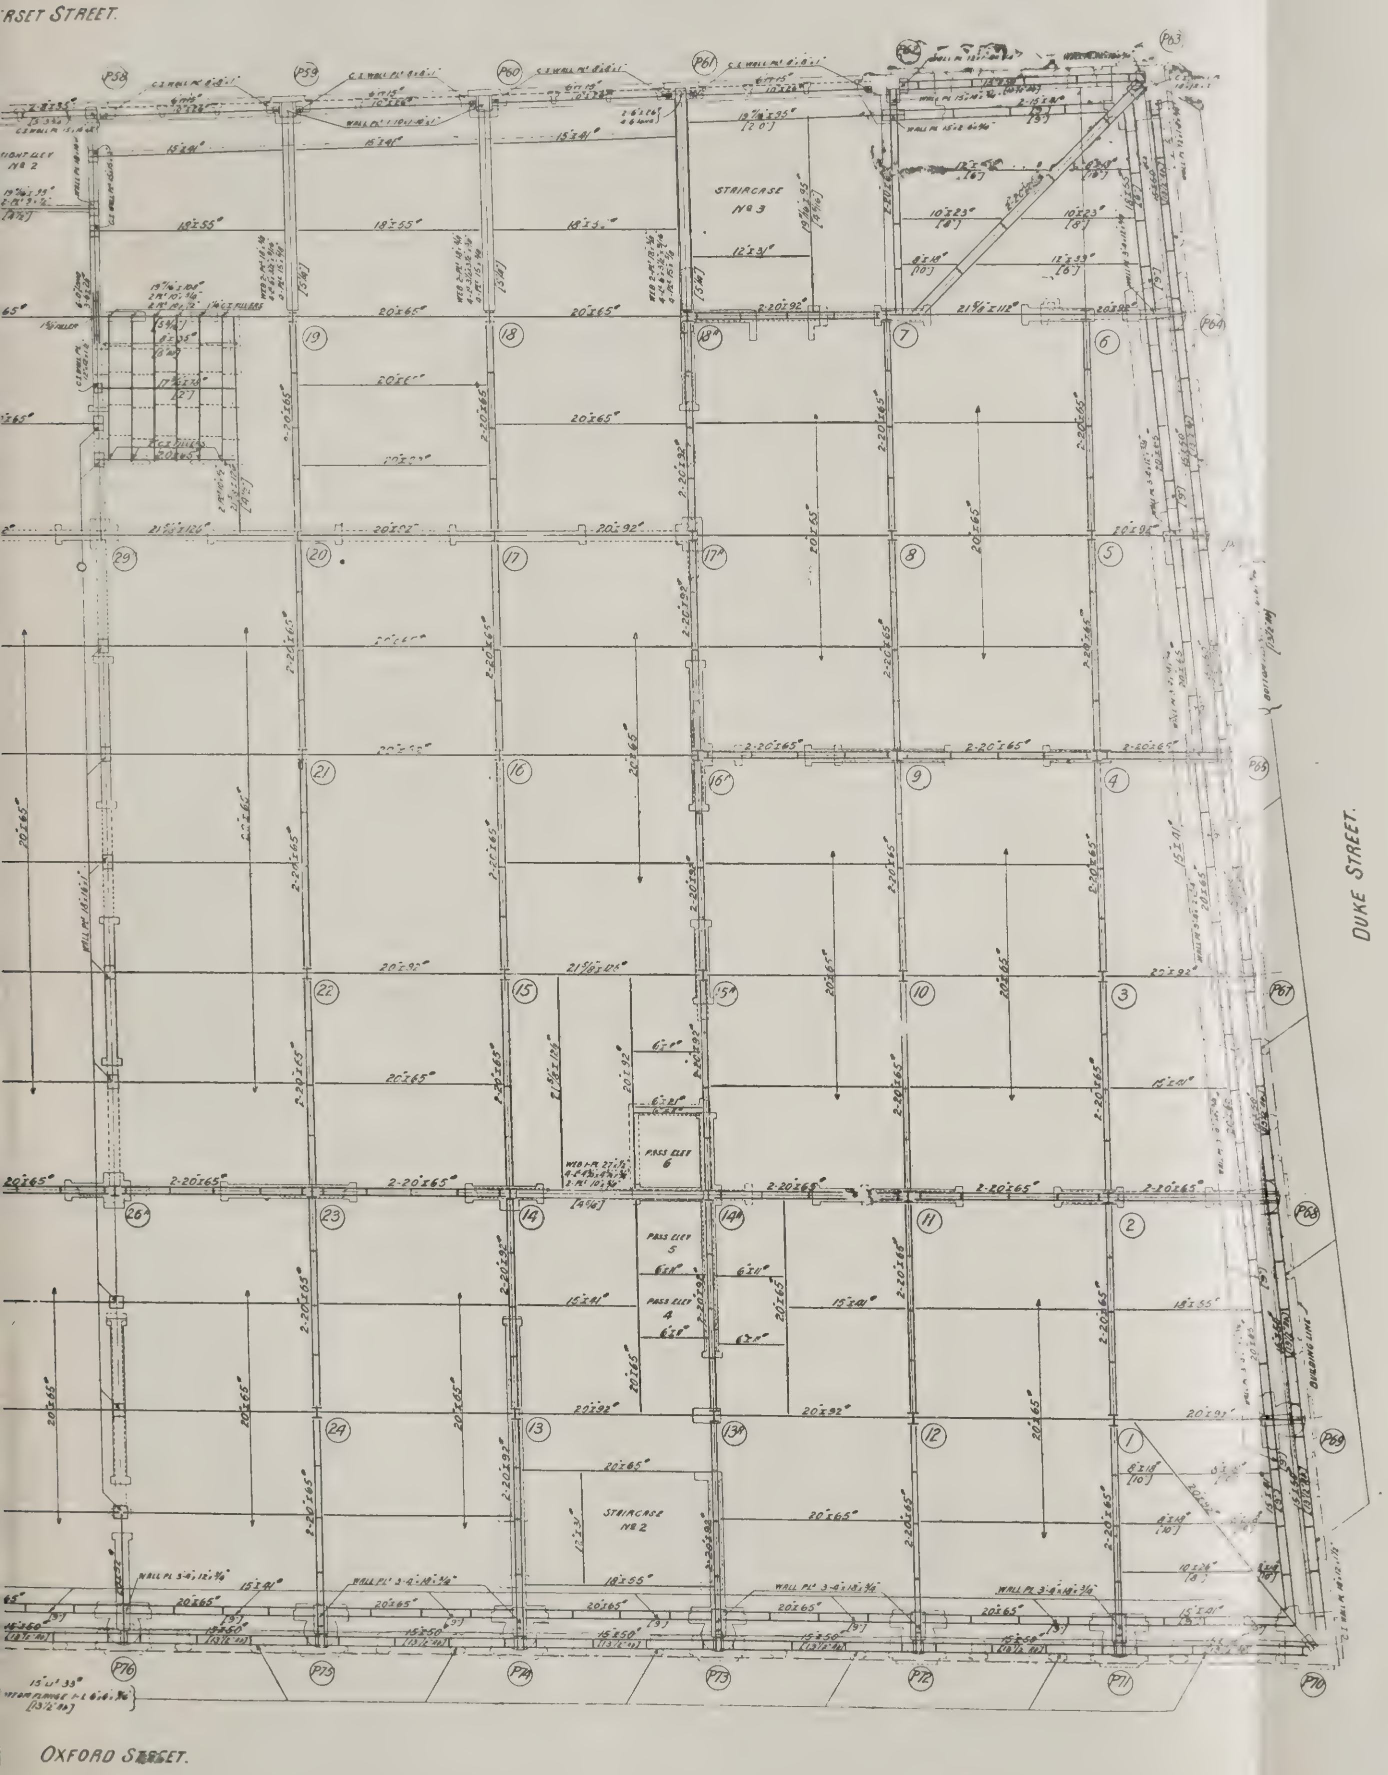
The lengths of the columns were designed for two storey lengths, the splice of the columns being made about 1ft. 6in. above the floor level. The splice plates were riveted to the flanges of the columns, and no cap plates were used.

The girders are carried on angle brackets, and supported by stiffening vertical angle-irons, which outstanding leg is cut on the splay to suit the architectural cap.

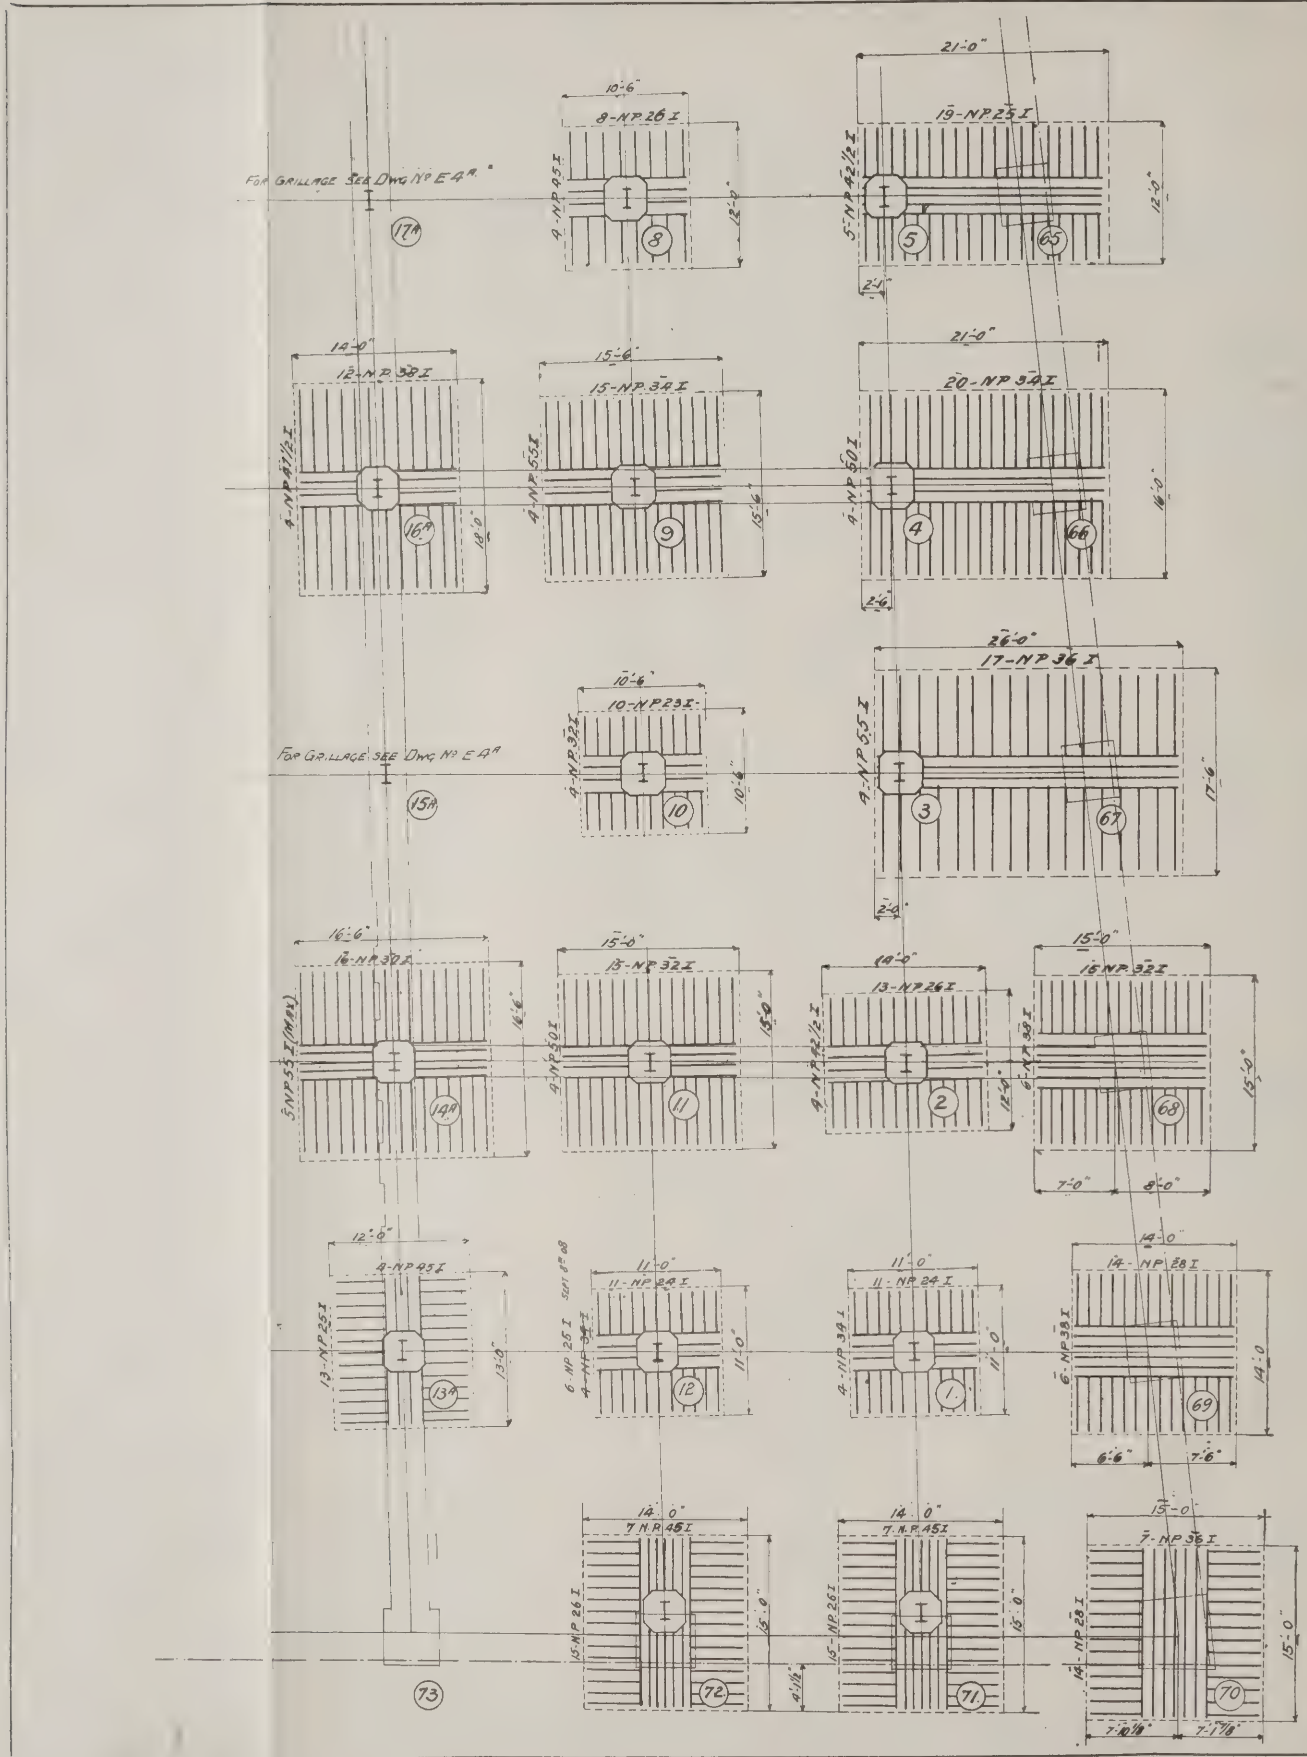
The diameter of the steel columns had to be made small in order to suit the diameter of the architectural columns.



SELFRIDGE STORES,



ORD STREET, LONDON. STEELWORK PLAN, SECOND FLOOR.



THE SELFRIDGE STORES, OXFORD STREET, LONDON; PORTION OF GRILLAGE FOUNDATION PLAN.

The ends of the columns were planed perfectly square to their axes in order to provide a proper butt joint.

The floor framing consists of 20in. deep beams for all standard panels, two beams being used in the direction of 24ft. span, and one beam being used placed 12ft. centres for carrying floors.

Twenty-inch beams of special heavy section have been used for carrying the division walls.

All connections between girders and beams, and between girders and columns, were riveted. Cast-iron separators have been placed between the double beams to afford greater stiffness.

Retaining Walls.

The retaining walls around the site are constructed in plain concrete, except that to Somerset Street, where a reinforced concrete retaining wall is constructed 60ft. On page 191 is shown the section of plain concrete wall and spandril at base and ground floor.

Trenches were made for the retaining walls before the excavation was completed, and the retaining walls were put in before any other work was done. The reinforced wall was built in its entire length at one and the same time. The excavated branch was 200ft. long, 25ft. wide, and 60ft. high. The earth pressure was resisted by horizontal pitch pine struts 10ins. by 10ins., placed 3ft. centres vertically and 6ft. centres horizontally.

(To be continued.)

HE CONCRETE INSTITUTE.

THE COMMERCIAL ASPECT OF REINFORCED CONCRETE.*

By Lucien Serraillier.

(Concluded from page 172, No. 733.)

Data.

The client, the lecturer thought, should reember that the more complete information supplied to the specialist firm he employed e more expeditiously and intelligently would s plans be prepared. Particulars concerning e loads to be carried, nature of soil and undations, materials available near site, ere essential. Architects should say hether the specified loads included the dead ad or not; the tendency to omit this inrmation often placed reinforced concrete in fair comparison with ordinary steel joist nstruction.

The nature of the test load should be ecified at the outset. Sufficient attention as not paid to the question of fire protecon. The nature of the aggregate, whether arp or smooth, a specification of the ment and its setting time, the breaking and astic limits of the steel, whether concrete ould be mixed wet or fairly dry, etc., ould be stated. The height of the floor ove ground when only one floor had to be pplied would materially affect the price, and even the scantlings of available timber for centreing, will, if known beforehand, enable the beams to be so designed as to utilise it without waste and thereby effect a saving. So that no details were so insignificant as to be despised.

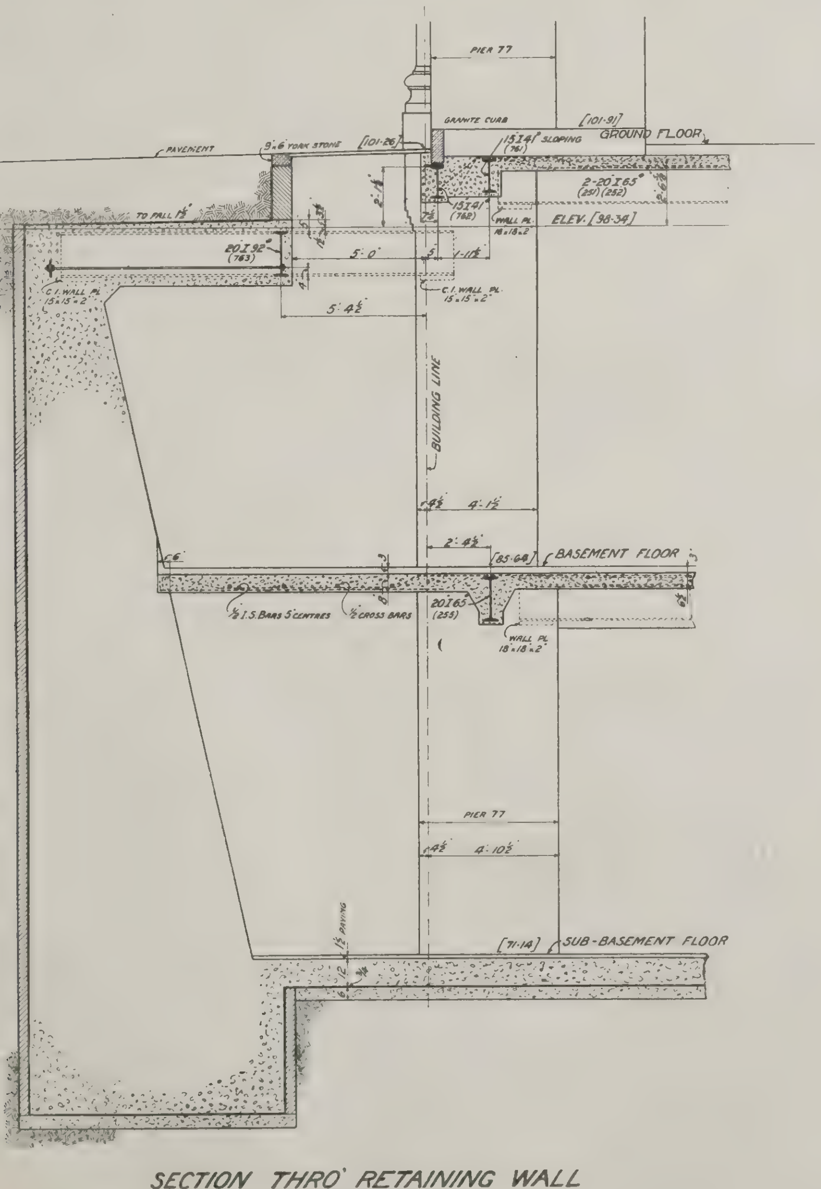
A point on which confusion often arose was the factor of safety. A comparison of competitive designs on a large contract would frequently reveal an extraordinary diversity in the factors of safety when these were reduced to the same denominator.

The client should at the outset clearly indicate whether designs were to be tendered upon by contractors selected by him or by contractors associated with and approved by the specialist firms. This saved time and useless correspondence, and would enable the latter to give detailed information to contractors with whom they were not associated when these were specified by the client, which was not necessary in the case of contractors with whom they worked together. Clients should, in justice to competitors, place them all on the same footing, and any deviation from this rule should be resisted by competing specialist firms, who should co-operate in refusing to submit designs under conditions which did not give all the same chance.

Preparation of Designs.

When inviting competitive designs, the client should not ask for too many details at the outset, but should be content with diagrammatic plans which indicated the system proposed sufficiently clearly to enable him to make a selection. He should remember that plans were generally prepared free of charge by specialist firms, and consideration should be shown by not throwing too much useless work upon them. The present tendency was to require too much detail before the selection of a specialist firm was made, and this was particularly irritating when schemes were only in their initial stage.

It was a regrettable fact, to which attention must unfortunately be called, that designs obtained from one specialist firm were sometimes sent by the client to a competitive firm to see if the latter could improve upon them. A design was the property of the designing firm, and should be respected as a privileged communication until the client had acquired it on the terms on which it is submitted. The communication to a rival was a breach of faith which the lecturer suggested should be met by a joint undertaking by specialist firms to refuse work offered under such conditions.



SECTION THRO' RETAINING WALL
.OXFORD ST.

SELFRIDGE STORES, OXFORD STREET, LONDON.

Estimates.

Generally the client was in a tremendous hurry for his plans. Hurry meant mistakes, and for these the specialist firm had to suffer. The modern system of bustle and strenuousness, so much admired in another hemisphere, was peculiarly unsuitable for reinforced concrete, for in this, more than in any other branch of construction, more haste meant less speed. Engineers and architects who took months to mature a plan expected very often full detailed plans by return of post. Specialist firms should resist such demands, and refuse work for which a proper time allowance was not made, rather than risk a disaster which may affect the whole industry.

Differentiation of Work.

There was a present tendency to lump all classes of work together, and to invite tenders on the whole contract, even in cases where the reinforced concrete portion is relatively insignificant as compared with the remainder of the contract. It could not be too strongly insisted upon that reinforced concrete was a separate subject altogether, and that the portion of a contract which concerned it should be scheduled apart from the other portions of the same contract, and separate tenders invited upon it. In the case where the reinforced concrete portion was the most considerable part of an important contract, the other portions might form sub-contracts. But it was essential to differentiate the reinforced concrete from the rest, so that the estimates from specialist firms might be compared together on their merits without being affected by other portions of the contract. A satisfactory tender would frequently be spoilt by the addition of excessive sums for other portions of the work with which the contractor was not familiar, and for which he provided too large a sum to cover himself against possible loss. This occurred specially in cases where prices were sent in hurriedly and the specialist firm or the other contractor had no time to obtain sub-estimates.

Payments.

It was desirable that specialist firms (B) which supplied reinforcing material should receive payment for this and for their designs, if these were charged for, direct from the client, and not from the contractor as at present. This would avoid the frequent unjust detention of moneys for materials supplied to the contractor by the withholding of the necessary certificate of payment when the contractor had failed to satisfy the engineer or architect.

Discussion.

Mr. F. E. WENTWORTH-SHIELDS said he was sure they all owed a deep debt of gratitude to Mr. Serraillier for his most interesting paper. He pointed out to them that reinforced concrete had brought into being a number of what were very rightly called specialists, specialists of all kinds, the designing specialists—he did not use the word in any invidious sense—and the merchant specialists, and they had done an immensely good work in this country. Mr.

---

* Abstract of paper read by Lucien Serraillier at the ird General Meeting of the Concrete Institute, bruary 16th, 1909.

Serraillier had pointed out a good many difficulties under which they had to work. In fact, his paper might almost be called the bitter cry of the reinforced concrete specialist. Personally, he was very sorry for the specialist, and one reason was that he had done a magnificent work for them, and yet, he thought, he was bound to disappear. At all events, he thought the designing specialist was bound to disappear, and he thought before he went they ought to say that they owed him an immense debt of gratitude. He had preached reinforced concrete in season and out of season to a very apathetic public, and by means of inventions and investigations had done an enormous lot to push forward the use of this most useful material. But he was bound to go, he thought, simply because history repeated itself. They were very much in the same condition now as half-a-century or more ago, when the use of wrought-iron and steel girders was first practised. Before that time arch and suspension bridges were common, but when steel girders first came in—he thought the Britannia Bridge over the Menai Straits was the first large girder bridge ever built—people were extremely suspicious of wrought-iron girders, and some thought it was not quite right that thin steel plates should be built up in such a way as to carry heavy loads. But as confidence was acquired, the extended use of girders might be said to have been brought about by girder-designing specialists. As time went on, and as every young engineer and architect got familiar with the practice of girder designing, the specialist died out, and with or without the assistance of a trained draughtsman, a man designed his own girders; and he thought the same thing would eventually happen in regard to reinforced concrete. He thought the time would come when the architect or engineer would make his own design. Of course, it might be said that the fact that a great many designs were in the hands of patentees would prevent this, and that the patentees would naturally prefer to make their own designs. It might be a heresy, but he thought the time would come, before very long, when the fact of having a patent would not be of very much value to a designer. Some of the patents had already expired, and he thought the time would very soon come when an engineer or architect would be able to make his designs without fear of infringing any patent whatever. He would like to say a word about failures. He thought what the author had said about the necessity for giving full information about failures was most important. He remarked a little further on in his paper that the Local Government Board had rather set their faces, apparently, against reinforced concrete, and evidently they were fearful of these failures. He supposed the fact was that they, as an Institute, wanted to investigate these failures, and to lay down such rules for reinforced concrete construction as should practically ensure a building being able to avoid the various causes of failure mentioned by Mr. Serraillier, and that was a work which the Concrete Institute ought to do, and was, he thought, doing. When they had done that and were in a position to say that, provided their rules were followed, they could guarantee a life of thirty years or more to a reinforced concrete structure, then he thought the Local Government Board, and all the other authorities, would have to recognise the full value and usefulness of this new type of construction.

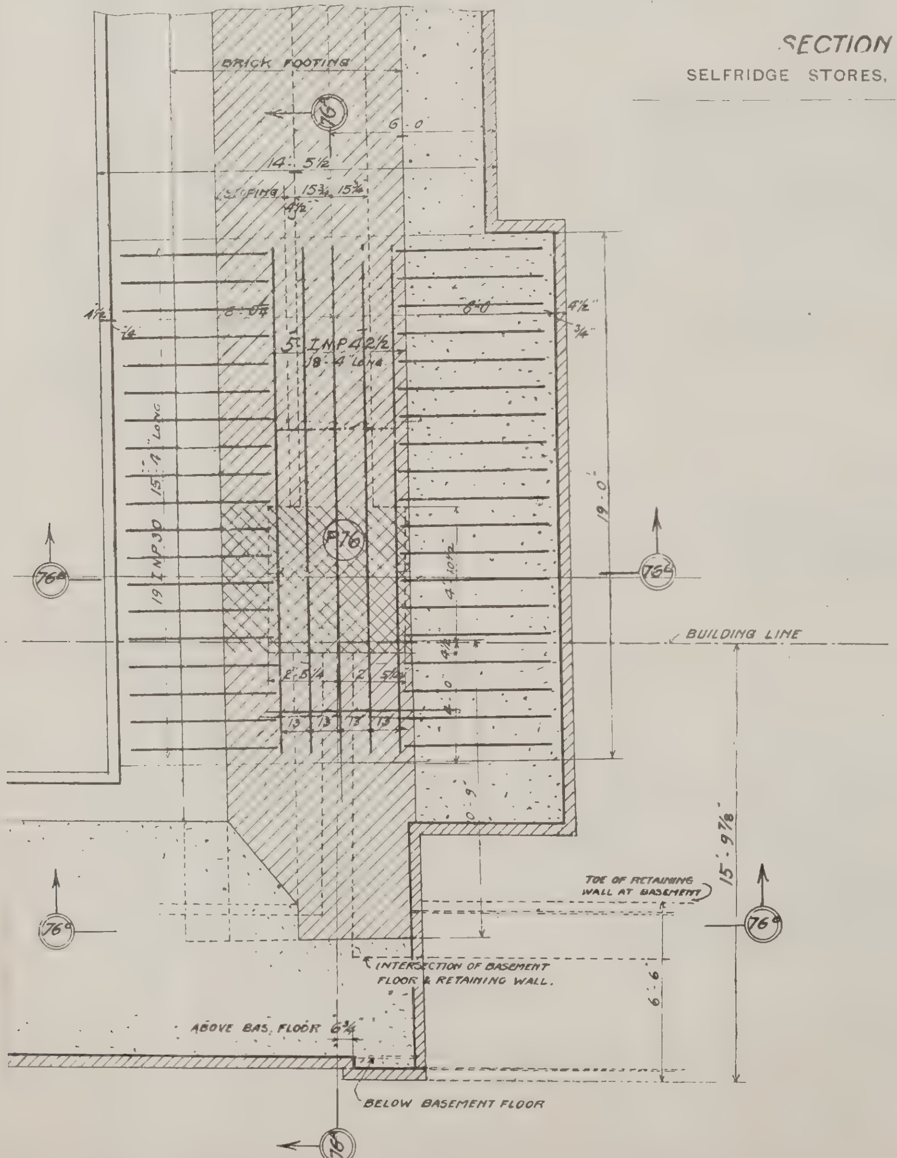
SECTION 76B-76B

SELFRIDGE STORES, OXFORD STREET, LONDON.



SELFRIDGE STORES, OXFORD STREET, LONDON: PLAN OF GRILLAGE AT SECTION 76B—76B.

Mr. A. ALBAN SCOTT said it seemed to be an entirely wrong principle to call a man a reinforced concrete specialist who did anything else but design the structure. A firm which had a patent on the market could not possibly hold that absolutely unbiassed position which a specialist should hold.

Mr. E. FIANDER ETCHELLS said the Concrete Institute should strive to combat the esoteric opinion that there were two kinds of natural law in the physical universe, one kind for reinforced concrete, and the other for all other materials. On reading some of the circulars sent round, one would think that reinforced concrete, not being in existence when the laws of nature were framed, was not included therein, or was specially exempted therefrom. Mr. Serraillier, in reference to his statement that in France a specialist who designed a faulty building was put in prison, said that this was a knotty point which might be discussed by the Concrete Institute. In this connection, he (Mr. Etchells) suggested, as an additional inducement to rembership of the Concrete Institute or its Council, that the Institute should go bail for such unfortunate designers. If the building authority were to plead for the enactment of imprisonment on failures, he feared there would be a great outcry, and yet in the oldest school of laws in the world, laws older than the Decalogue, in the Code of the Kingdom of Babylon more than 4,000 years ago, he read that "if a builder has built a house for a man and his work is not strong, and if the house he has built falls in and kills the householder, that builder shall be slain." Doubtless that law tended to ensure sound construction, but to-day more than ever before it was the man who cut things fine and took the most risks who would usually got the most orders. The contractor who thought to-day of strength alone, not counting the cost, would most probably end in the bankruptcy court. They all knew how often an order was missed because some person less scrupulous or more daring had cut down his thicknesses, and thus obtained the coveted order. Unrestricted competition did not make for sound construction and fair prices. In that connection he urged that the Concrete Institute should take up the suggestion given in the paper as to whether the regulations of the R.I.B.A. Reinforced Concrete Committee should not be adopted by this Institute, with the necessary simplifications and amendments. If they could get rules with such support as to obtain national acceptance, they would do much to restrain uneven and unfair competition. There was another advantage in obtaining a general adoption of an accepted code, and that was to reduce the cost of preliminary drawings submitted with tenders, because it should be sufficient to examine the general lines of the design if all the designs submitted were based on the stresses of the R.I.B.A. Report, as amended. He noticed that the author of the paper had invited their attention to the dangers of "hustle" in the preparation of drawings for reinforced concrete work, and he would point out that "hustle" was very much greater in the actual execution of work on the site.

Mr. G. C. WORKMAN thought that the specialists, who were destined to disappear some day or other, were suffering very much from a want of data when asked to supply a design. Very often they were not given the superload, and he knew they were in competition with other firms who were probably not given the superloads either, and they were generally left to guess them. They might, of course, guess 1 or 2cwt., and naturally the price of the various designs differed. Another thing they suffered from very much was that they were not given the bearing capacity of the ground. He wished to take this opportunity of telling architects how absolutely necessary it was to give these proper data. They could not build a footing without knowing the bearing capacity of the ground. If they were not told these things, how were they going to work? They had to guess them. They might guess a capacity of 2 tons to the square foot, but another specialist might guess something much higher, with the result, of course, that there was going to be a greater difference in the ultimate cost. With regard to the difference in the working stresses of the materials, that he thought was a most serious point, and he could not say too much to make them feel how serious it was. They were not all working on the same stresses, and he thought it was only fair to those who were, like themselves, working under the Rules of the Committee which had been by the R.I.B.A., that when they were working under those Rules in competition, all the others ought also to work under them. Instead of that, he did not think that was actually the case. As to the factor of safety, this was a most vital question. They had been asked to provide for a factor of safety of 5 in certain cases. They thought 3½ was quite sufficient. On the Continent a well-known specialist never thought of giving more than 3½ or 4; it simply meant a waste of materials to give more than that. With Mr. Serraillier, he did not think some people realised that the factor of safety was a proportion of the breaking strain. Concerning the preparation of designs, this was also a very important point. Mr. Serraillier thought that far too many details were required from specialists, and there was no doubt about that, but he could quite sympathise with the architect. There was such a diversity of systems and methods of placing bars in a beam, for instance, that he could quite sympathise with the architect who said he must have some kind of idea what the system was going to be, inasmuch as nowadays all architects were taking a great interest in reinforced concrete, and were quite capable of checking if such-and-such a system would be efficacious or not. Therefore, he thought that, although in preparing designs a simple sketch should be given, at the same time he thought it was advisable to give a cross-section, and a longitudinal section of the beam. With regard to "hurry," they were often asked to do some impossible work. They had to alter the architect's plans very often; they had to put beams in the proper position, because the architect had not put them there, not being quite aware of where they ought to go. It simply came to this, that of course the architects knew exactly where a beam ought to be, but they did not always know where it was most economical to place it. They were asked to hurry tremendously, and of course they were bound to make mistakes, and to suffer in consequence, but there was one thing that was a source of great distress to specialists, and that was that not only were they bound to suffer for a mistake in their designs, but they were responsible also for the quantities, and that of course was a thing that was a cause of great trouble between the contractor, the specialist, and the architect. With regard to failures, Mr. Serraillier said that in France they put the engineer in prison; that was, of course, in cases of fatal accidents, but he thought in England the same thing would happen. He thought if there was a fatal accident in England the engineer would go to gaol, and that was a strong reason why they should have definite rules which should be recognised in an official manner. He had said before that the rules of the British Committee should be adopted. Everybody said that, but was anything being done to make them adopted? He did not know what the Concrete Institute was doing in the matter. He was unable to attend the last meeting of the Council, but he thought some steps ought to be taken to try and impress on the authorities the necessity of getting these rules once and for all recognised, because there was no doubt about it that if there was a failure causing a death, some rules would have to be put forward, and he thought there was no doubt that the rules of the British Committee would be adopted, there being no others that he knew of. He wanted to say a word about Local Government Board loans. In England they could only get a period of 15 years for the repayment of loans. M. Coignet had pointed out that in France there were buildings in reinforced concrete which he himself had put up, which were over 30 years old, and were doing very well.

Mr. J. MUNRO said that he was in complete accord with most of Mr. Serraillier's paper, but there were one or two points he should like to speak about. With regard to responsibility, he held that that should be absolutely borne by the specialist, no matter whether he designed or carried out the work, because the architect in these days of stress and hustle had not got too much time in which to indulge in responsibilities or accept a divided responsibility. Of course, in years to come he expected the architect would have the Alpha and Omega of reinforced design at his finger-ends, and then he would be able to accept what at the present time he (Mr. Munro) would be very loath to load him with, i.e., responsibility. With regard to the testing of material, he thought that was all to the good. They ought to make good all defects, and ought to be responsible for quantities as well. It seemed to him that if the architect gave them work to design and carry out, it ought to be undertaken in the same spirit as a builder would undertake it. There should not be a too divided responsibility. There was one question that Mr. Serraillier had left out, and that was a question of payment. He thought that in every specification, an estimate that was given by a firm of concrete people ought to include a specific sum, which should be a general one, for the builder. The builder was entitled to a sum because he had lots of little things to see to, and a lot of little responsibilities, and it would be only fair to him to have a little return. He thought 5 per cent. ought to be added on. With regard to contracts, if the amount of the contract for reinforced work was not a serious one, he saw no reason why it should not be amalgamated in the general bill, and the building contractor pay the specialist; but if the work was of serious import, he agreed with Mr. Serraillier that the contract should be made direct. There might be some agreement made in respect of the Concrete Institute with the R.I.B.A. as to the stress and strain, and in agreements as between the general contractor and the specialist there ought to be some step taken to obviate unnecessary or harsh clauses in the agreements. The contractor had the control of the building, and if he chose to be arbitrary, he could order the specialist off the job.

Mr. M. KAHN said that Mr. Serraillier had made a very common error in crediting the Continent with being the cradle of reinforced concrete. As a matter of fact, an Englishman was using reinforced concrete at a time when M. Monier was still a small small boy in knickers. It had often been proved that reinforced concrete was not born on the Continent, but in that cradle which was rocked between the Irish and the North Seas. He heartily confirmed the contentions of Mr. Serraillier with respect to failures; an accident must result either from faulty construction or from faulty labour and material. The question of responsibility was, he thought, more a trade problem than a professional problem. With regard to the expense incurred in the preparation of drawings, which Mr. Serraillier stated sometimes amounted to as much as £100, he could give several instances where the expense had involved more than £100. It was to be regretted that so many bad schemes were thrown on to the specialist to deal with; schemes which were never intended by the architect to materialise. What Mr. Serraillier stated regarding designs of competing firms being passed round, was only too true, and he had often thought such a procedure was just cause for legal action. Some of the points raised in the paper should not be treated professionally by the Concrete Institute, but in a professional manner by the co-operation of the specialists; and whilst much good would result if all Mr. Serraillier's suggestions were carried out, it was almost hopeless to expect that all of them would ever come into effect.

Professor HENRY ADAMS said the greater part of the paper consisted of statements that could not be gainsaid, but there were points in it, he thought, which were open to question. The chief point of the paper appeared to be the supremacy of the specialist contractor, who should combine in himself the designer, constructor, and supervisor. He demurred to that. It was like combining the cashier and book-keeper, or the auditor and treasurer, and he thought it was generally agreed that that was not a workable or satisfactory arrangement. The author spoke of the engineer and architect as being liable to make mistakes, with possibly a loss of reputation, but no pecuniary loss. As he took it, the law stood this way —that a professional man was not liable for errors of judgment, but he was liable for negligence, and that was the distinction between the cases where an engineer or architect was or was not responsible. With regard to the factor of safety, he often heard of questions on that subject. It was something like the dividends on investments on the Stock Exchange; they might get a big dividend or a small dividend, but it all averaged out to something under 5 per cent. In factors of safety, they might say that they gave a factor of 4, 5, or 3, but that factor was not a definite, fixed amount. They might call it 5 when they were really only getting 3. The factor of safety was a figure that should cover all contingencies; those contingencies varied in every case, and it was not as if they had perfect material, perfect workmanship, and perfect design, and knew exactly what they were getting, so that a factor of safety at 4 meant a factor of safety at 4.

A Member: It is a factor of ignorance.

Professor ADAMS, continuing, said that if they could rely on what they were doing, they could be satisfied with a factor of safety of about 2½. They must have at least 2 to keep within the limit of elasticity, but 2½ would probably be safe. It was because of the unknown matter that they had to make a greater allowance. The Regulations of the British Reinforced Concrete Committee had been referred to. He thought that was a very good thing for the Concrete Institute to consider, and he hoped that they would then simplify the formulæ, and take great care that contingencies were properly allowed for. In all formulæ of that kind there was a tendency to be too theoretical, to consider that the work was perfect, whereas in practice they knew that they could not always rely upon the supervision the work would get; they could not rely upon the men, and not always on the material, and so some of these formulæ were too finely cut for practical use. With regard to failures, on the Chinese Railways, when railways were first formed there and an accident occurred, the contractors were put in prison, but he thought, in the case of reinforced concrete, so far as his experience went, it was the workmanship that was more often in fault than the design, and therefore the heads of the departments were safe as regarded penalties.

Mr. HERBERT E. BROOKS said there was a reference in the paper to the question of Local Government Board action on the loan matter, and remembering what the ways of Government Departments were, it had occurred to him that they might possibly have a better chance of securing a result if they were to ask the Local Government Board themselves to select and appoint a committee to deal with this question. They knew what a strong representation was made not very long ago on this very question of a committee, and how exceedingly obdurate the President of the Local Government Board was in the matter. Mr. Burns was quite alive to what had been going on, and he knew the object with which the questions in the House of Commons were put. The Local Government Board, he said, was not satisfied, and they must have this information concerning the durability of these structures before they would listen to any lengthening of the terms they had hitherto been willing to agree to. It had occurred to him (Mr. Brooks) that possibly the line of lesser resistance might be to invite the Local Government Board itself to select the committee.

Mr. JOCELYN remarked that if the Concrete Institute were to combine with the R.I.B.A. to amend the rules for designing reinforced concrete which all specialists would work on, could they depend on the specialists working on those amended rules? Up to the present, in ordinary steel construction, he did not think there was an engineer who would be dictated to by any committee. Could they, therefore, rely on the concrete expert being dictated to?

The CHAIRMAN said he would like to join with those who had spoken in thanking Mr. Serraillier on behalf of the Concrete Institute, for the very excellent paper which he had put before them. There were, as they all knew, a very great number of abuses at the present moment in the execution and in the design of reinforced concrete work, and in the practice, if he might so term it, for practice was a word which perhaps covered the subject matter of Mr. Serraillier's paper best. He agreed, as he had said before, that they would disappear gradually as architects and engineers because more acquainted with the subject of reinforced concrete, both its advantages and its limitations, and although he quite saw what Mr. Wentworth-Shields was driving at when he spoke of the possible extinction of the reinforced concrete specialist, he did not quite share those views in the light in which they were put forward. He was under the impression that it would simply be a change in procedure. The architect would design more carefully; he would specify more carefully as he understood more about the subject; the younger generation would know the subject thoroughly in about ten years' time, and that was about the time when they must look forward to a more general practice in reinforced concrete. A specialist would get to read good specifications, and those who sold special articles, like bars, would make those bars to specific specifications, and the result would be very much the same as what they were having now with steel-frame construction, that there would be a practice based very much, as it was at present in steel-work, on standards, not so much, perhaps, on legislation as on rules, but on standards arrived at after joint consultation between the industries concerned. The architect would know what he wanted in detail, the engineer likewise, and the specialist would really be having rather an easy time, or he would become a constructor or contractor more than a designer, and it would not be expected of him to design to the extent he had to do now in order to get work at all. They were all very thankful to the specialist that he should have done such a lot of pioneer work, but if they came to think of it closely, he had done a great deal of work that the architect or engineer ought to have done of his own accord. Regarding the point as to failures, he believed that the precise publicity of the causes of failure would be of advantage to the development of reinforced concrete. The unknown was always worse than the known, and to know precisely what were the very few points in which reinforced concrete had its dangers, and to know what was to be avoided, meant that they would not have any failures, and that those precautions would be taken that were really necessary. They had heard something said about the legal aspect of these questions. France had the "Code Napoleon," and some other countries also, and it could be precisely stated that the French architect, builder, or contractor did go to prison, and had to prove his innocence, while at the very most they in this country could have a case of manslaughter, which did not immediately assume guilt. The whole principle of the law was that the moment a building was down, the French responsible official, were he architect or contractor, was assumed to be the guilty party, and he had great difficulty to prove that he was innocent. Another point brought out on the legal questions was unfair competition. There were laws in two countries—Germany and Austria—where unfair competition was a criminal offence, and it not only affected the contractor in building construction, but it affected everything practically that was sold or was erected or constructed in those particular countries. Then there was a technical or trade question brought forward, viz., the question of discounts and builders' payments. He sympathised with the view put forward by Mr. Munro. A contractor should receive a specific sum, preferably about 5 per cent. or 7½ per cent., for the trouble he had to take in assisting and making room for the specialist contractor. The fixed sum should be provided, and personally he had always provided 5 per cent. in contracts for the general contractor where a specialist contractor was also employed. But he had also found in two cases that the builders had, nevertheless, tried to make a little extra out of the specialists in what they called a "cash discount." The cash discount was anything between 2½ per cent. and 10 per cent., and however they might object to it, it was regrettable to state that there were cases where specialists simply agreed to make this extra payment. He could only advise specialists in such cases to go straight to the architect, and state their case. He had very soon had a stop put to it by having payment made direct from the client to the specialist, and the amount deducted from the general contractor's bill. He was much pleased to hear the proposal made by Mr. Brooks, that a suggestion might go from the Concrete Institute to the Local Government Board that a departmental or some such committee of inquiry should be held in the matter of loans for reinforced concrete work. He thought this would do a great deal of good, particularly at the present moment, when there were a number of proposals being brought forward by different municipalities with a view to obtaining powers to allow reinforced concrete buildings in their districts. In conclusion, he again thanked Mr. Serraillier for his paper.

Mr. L. SERRAILLIER, replying on the discussion, said his paper had not provoked as much criticism as he anticipated. He knew there was one gentleman in the room who was thirsting for his blood, and he wished he had spoken. All the specialist representatives were of the same opinion, and the architects and engineers were of another opinion; that was to be anticipated. His paper was not a bitter cry of the specialist, but simply an indication of the difficulties they had to encounter at this moment, and which they would overcome. They had not any intention whatever of disappearing. On the contrary, they had come to stay, and they were doing very well, all the same, with all these difficulties, which he thought would be less when the situation was better understood. He thought that was the reason why things were so difficult at present. He did not see why they should disappear. They were told that gas would disappear when electricity came in, but it had not disappeared at all. As to the question of failures, Mr. Workman told them of structures in France over thirty years old, and he thought that ought to be a sufficient indication that they could stand. As to the question of discount for the builders, and the suggestion that each specification should include, say, 5 per cent., he thought that was all right if some understanding could be arrived at beforehand about it. He was glad to hear it was an Englishman who first brought in reinforced concrete. When he said that the Continent was the cradle of reinforced concrete, he meant that the material was first developed on the Continent. Mr. Brooks had suggested that the Local Government Board should be approached by the Institute to appoint a committee themselves with regard to the question of loans, but he was afraid the President of the Board was entirely in the hands of his technical advisers; that was where the difficulty lay.

The hon. treasurer announced that the next meeting of the Institute would probably take place on March 18th.

METHODS OF ATTACHING SHAFTING AND MACHINERY IN REINFORCED CONCRETE BUILDINGS.

The manner of attaching shaft hangers, pipes, and machinery to beams and floors in a factory or mill building of the reinforced concrete type is a detail of considerable importance, so much so in fact, that often if no satisfactory scheme is explained to the owner he will not consider the use of reinforced concrete beams in his proposed building. In the ordinary mill constructed factory with wooden or steel floor beams there is no special difficulty in attaching hangers for shafting and pipes or fastening machinery to the beams and floors in any desired location without any previous plans necessary and at a minimum cost. But in a concrete building the conditions are entirely different, and it is much better to adopt some scheme for the installation of the machinery, piping, etc., before the building is constructed if we wish to obtain the best results in all respects.

Shaft Hanger Supports.

Appliances for conveniently supporting hangers for pipes and shafting and for supporting motors and other machinery from the beams and ceiling probably require more previous planning and careful selection than are necessary for other phases of this subject. The method recommended by the engineer and adopted for use with this type of building should be one designed to best meet all the requirements so far as can be known of the building and its later equipment. It should be inexpensive, compact, and simple in form, with not too many separate parts, and as flexible as possible to accommodate future changes in the line of shafting, additions, or improved machinery, etc.

We have here collected a few different systems which are used by specialists in concrete construction.

One of the most common methods employed is to attach a hard pine timber to the under side of the concrete beam. This may be in any desired length, to which the shaft hangers are bolted or lag-screwed in their exact position as is shown in Fig. 1. The timber can be secured to the bottom of the beams by bolts built into the concrete about 4ft. on centers, with a projecting threaded end and nut below, or by the use of sockets, inserts, sleeves, and washer nuts imbedded in the concrete, into which the timber pieces are afterwards fastened. If the bolts are used, care should be taken to set and keep them vertical, also have them thoroughly anchored into the upper part of the beams.

Fig. 2 illustrates the long bolts with saddles and check nuts to hold them in position, which is quite essential. It is seldom that all the bolts projecting from the bottom of the beam are made use of, and where not used they present an unsightly appearance, hence sockets or sleeves and washer nuts are often preferable. These can be kept in correct position with less trouble, are about the same cost, and make a neater looking job.

In Fig. 3 we have shown a special socket. This device serves also as a support and spacer for the beam rods, keeping them all properly spaced from each other and from the beam box or centering. Fig. 4 represents a socket sometimes used. It is made of a short piece of wrought iron pipe tapped out on the inside to receive a lag screw or bolt. Holes are drilled near the top, through which a ¼in. rod or stirrup is placed which should extend well up into the concrete. The socket itself is temporarily held in position before the concrete is placed by setting it over a wooden plug nailed to the centering. The stirrups are not easily kept in an upright position. For this reason this socket is not altogether satisfactory.

The socket shown in Fig. 5 is made of cast or malleable iron with a flanged top, which serves to anchor it into the concrete. A vertical stirrup should be used with this socket if it is placed in a beam and is intended to support much load. If used as shown in the sketch it also acts as a support for the rods.

Another special socket shown in Fig. 6 can be made use of for almost all supports in reinforced concrete work. It is a malleable casting made in many sizes. can be anchored as securely in the concrete as may be necessary by the use of stirrups, and is more or less adjustable.

Another form of adjustable sockets or inserts for use in beams, principally, is shown in Fig. 7. These castings are made in convenient lengths, and are set on the forms for centering before the concrete is placed. The slot in the bottom makes it possible to place hangers or bolts at any desired location along the length of the insert.

nuts imbedded in the upper part of the concrete beam, usually about 4ft. on centers. These are temporarily held in position by a thin iron tube resting on the centering and by a bolt projecting through the hole in the bottom of the beam box. The washer nut is tightened down to the top of the tube which secures it firmly in an upright position. When the beam boxes or centering are taken down the bolts are easily unscrewed from the nut, leaving a clean passage through the concrete to the nut above, to which can be attached timber or iron stringers, on to which the shaft hangers can be fastened in the ordinary manner.

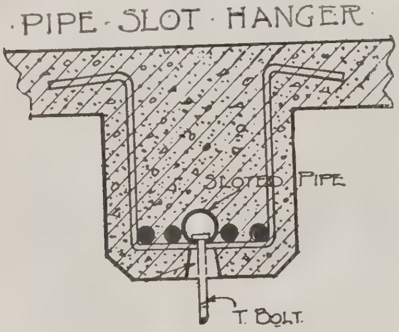

Fig. 8.

Figs. 8 and 9 illustrate two other methods used for attaching shaft hangers and machinery to beams. With either of these schemes the shaft hangers or other fittings can be bolted or clamped to the concrete structure without the use of wood timbers or iron bolsters, if so desired. The method shown in Fig. 9 is also serviceable.

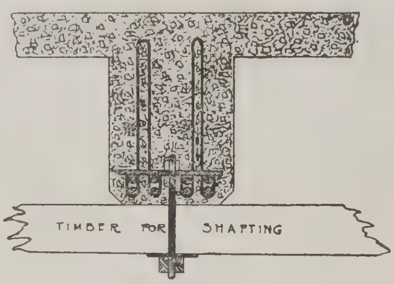

FIG. 10.

Another method is suggested in Fig. 10, which can be made a strong and serviceable support for motors and machinery.

Other systems which have been used quite extensively are illustrated in Figs. 11 and 12. When a bolt is used through the beam near the top a metal sleeve with a wooden core is concreted around to form the hole. These openings also permit the passage of pipes and wires. Large holes left in certain parts of beams and girders might cause weakness in the compressive side of the member. If so, an iron pipe sleeve of sufficient thickness should be used. It is rather difficult to always locate the holes through the beams during construction to conform exactly with future changes. Therefore, the system of using the hooked hanger bolt inside the beam is more satisfactory. If the holes for the hook bolts are cut with a pneumatic drill it can be done at a nominal cost.

Wires and Sprinkler Pipe Supports.

Blocks of wood are often set in the under side of concrete slabs to which are fastened wires and small sized pipes and wire conduits. This is not considered a suitable or permanent support. It is much better practice to use either expansion bolts or locate and place adjustable sockets and inserts in the concrete work. Often the conduits for wires are placed on the centering and imbedded in the concrete slabs. If the pipes are not too large and are located with due regard to the reinforcing metal, there is no serious objection to this method. Piping for sprinklers is generally planned before the concrete work is started. It is therefore a simple matter to place inserts or sockets where needed in the concrete work, to which the pipes can be readily attached later on.

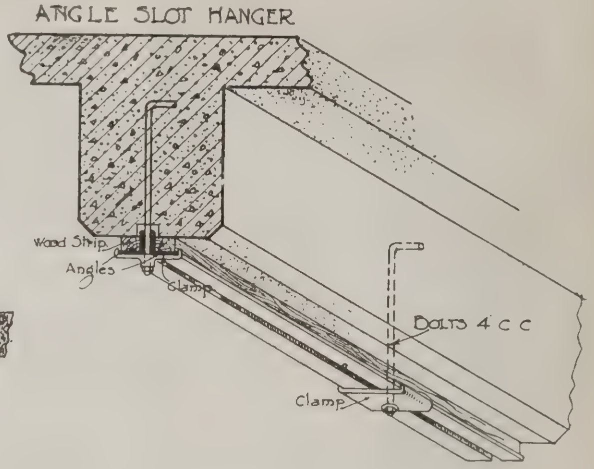

Fig. 9.

Machinery Fastenings.

Large machines with heavy bases setting on the floor seldom require any special fastenings. It is usually sufficient to thoroughly grout with Portland cement mortar the base of the machine to the concrete floor. Small machines can be fastened directly to the concrete by expansion bolts or similar methods after the floors are concreted, the cost of drilling for these fastenings being a small item of expense. Sometimes, however, it may be necessary to bolt through the floor in order to hold certain machines rigidly. If through bolts are required the holes should, if possible, be located before the floor is concreted; otherwise, in cutting these holes through the floor reinforcing bars are liable to be encountered, which would cause more or less difficulty and might lead to serious trouble if cut off. In most cases machinery runs better and lasts longer if placed on solid foundations, and reinforced concrete floors are admirably adapted for machine shops. There are, however, exceptional cases where machines seem to require more or less "give" on their basis in order to work and endure most satisfactorily. This is particularly true with certain textile machinery, and where a cushion is required a wood floor can be laid, or wooden timbers or bolsters can be fastened to the concrete flooring. It has also been suggested to use sheet cork, linoleum, or compressed felt under the base of machines in order to give elasticity of movement, lessen the noise of running machinery, and eliminate vibration as far as possible.

Federation News.

REDDITCH ASSOCIATION.

Secretary: H. Huins.

The third annual dinner of Redditch Master Builders' Association was held at the Unicorn Hotel, Redditch, on Thursday, February 18th, Mr. F. C. Huins, president, in the chair. About 60 gentlemen were present. After the usual loyal toast, proposed by the president, Alderman G. W. Hobson proposed "The Redditch Master Builders' Association," whose right to combine for the defence and advancement of their interests he maintained in a vigorous and pointed speech. The president having replied, Mr. Gross offered "The Town and Trade of Redditch" in a speech that revealed an intimate acquaintance with the past history and current topics relating to his subject; and all hearts warmed to him when he incidentally exclaimed: "I love to hear the tinkle of the trowel," and expressed a fervent hope that the time was at hand when this gladsome music would be less scarce than it had been for some time past. Mr. T. Huins, in responding, dealt authoritatively with local questions of burning interest. "The Local Governing Bodies," proposed by Mr. A. G. Avery, was replied to by Messrs. A. Brazier and H. J. Surman. "Our Visitors," proposed by Mr. George Huxley, was replied to by Messrs. J. Brazier and H. M. Grant. Mr. H. Holloway gave "The Architects and Surveyors," on whose behalf Messrs. John Johnson, A. J. Dickinson, and George Neason made exceedingly terse replies, the first-named gentleman taking a cheerily optimistic view of the future of the trade. "The President and Vice-President" were toasted in a singularly able speech by Mr. F. Amphlet, who, after setting forth neatly and concisely the advantages of collective insurance under a non-Tariff scheme, against workmen's compensation claims, adroitly drew a striking parallel between, on the one hand, combination for equitable insurance against accidents under the Act, and, on the other, insurance against labour disputes. The mere existence of the federated associations, he pointed out, might be regarded as insurance for the protection of the employers' interests. Just as a standing army and an efficient navy, or an efficient police system, was a kind of insurance against war or crime, even so an organisation was a safeguard against aggression and injustice, and was in this respect well worth the energy and money expended in maintaining it in a state of efficiency. He also strongly urged the association to do all in its power to promote the intertrading rule. It was a clever and telling speech, delivered with easy mastery of style. Mr. F. C. Huins and Mr. H. J. Surman replied. The energy and ability of "The Secretary" having been highly praised by Mr. F. Newbould, Mr. H. Huins made a brief and modest reply. Proposing "The Press," Mr. A. E. Edkins tempered a generous eulogy with regret that, with all its noble traditions, the Press was not entirely innocent of a tendency to depravity. It did not sufficiently concern itself with the things that really mattered—science, commerce, industry—but gave far too much attention to trivialities, and especially it accorded too much space to the unedifying details of divorce cases. In responding, Mr. J. F. McRae, of the editorial staff of the "Builders' Journal," acknowledged regretfully the truth of Mr. Edkin's strictures. In fact, he said, Mr. Edkins had made out a strong case for an extensive application of the whitewash brush; and the stuff used would have to be genuine sanitary washable distemper; but even then the ineradicable "yellow" tint would probably show through. The speaker believed that there was much truth in the saying that the public had the Press it deserved; and he also believed that in spite of all its faults, the British Press was absolutely the finest in the world, and perhaps, its greatest virtue was that it was incorruptible. But he had the good fortune to be connected with a section of the Press that was free from all taint of uncleanness. He claimed that the technical and industrial Press was doing excellent and indispensable work, and was on the whole doing it very well indeed. As to the journal that he had on that occasion the honour to represent, the modesty for which journalists are notorious forbade his saying very much. He would prefer the journal to speak for itself. It had won golden opinions and held a recognised position, and enjoyed a high reputation as one of the very best of trade journals. He could hardly refrain, therefore, from congratulating the Federation on its good fortune in having adopted so excellent a medium for the furtherance of its aims and interests. The speaker's presence among them—he had that day come all the way from London—was an evidence of the desire of the managers of the journal to carry out their part of the compact cordially, sympathetically, and ungrudingly. He had no doubt that the feeling would be heartily reciprocated, and he felt that there was no need to urge his hearers to give hearty support to the journal of their adoption, because, as business men, they would recognise that it was greatly to their interest to do so, the journal possessing a double value to members of the Federation. Mr. H. Guise, editor of the Redditch "Indicator," whose name also was coupled with the toast, dealt trenchantly and humorously with local affairs. Mr. Guise contributed several songs, most artistically rendered, to the excellent concert that lent variety to a thoroughly enjoyable evening.

WEST BROMWICH AND DISTRICT ASSOCIATION.

Secretary: Tom Dallow.

The annual meeting of the West Bromwich and District Master Builders' Association was held on Monday evening, January 25th. Mr. J. Bott, president, was in the chair, and in addition nine members were present.

The counter-notices from the operatives of the stonemasons, pasterers, carpenters, bricklayers, and general labourers, were read and consideed, but it was unanimously decided not to take any action in the matter at present, but to have a special meeting to consider further what course to take.

The question of adopting the inter-trading rule was further considered, but at present nothing definite has been decided.

It was unanimously decided that the annual dinner should be held on Tuesday evening, February 23rd, at the Dartmouth Hotel, West Bromwich, and the secretary, together with a committee, was instructed to carry out the arrangements for same.

The following officers for the ensuing year were appointed:— President, Mr. J. Bott; vice-president, Mr. William Jackson; treasurer, Mr. James Sadler; secretary, Mr. Tom Dallow. All the members present were entertained to dinner by the president.

An extension of the secondary schools has just been commenced by Mr. George Jones, and, should the Council proceed with the new refuse destructor and the new schools in the Hill Toy district, the outlook for the summer would be brighter. Mr. William Jackson has secured the contract for new schools at Warley, in the Oldbury district, and it is expected that new schools in Langley and Rounds Green will shortly be commenced.

WAKEFIELD ASSOCIATION.

Secretary: J. Beaumont.

The Wakefield and District Master Builders' Association held their eleventh annual dinner on February 11th, at the Strafford Arms Hotel, Wakefield. The president (Mr. Tom Lee) was supported by the mayor (Alderman Hudson), Mr. W. R. Thompson (Dewsbury), Mr. W. J. Ledgard (Leeds), and Mr. J. Davidson (Leeds), president, hon. treasurer, and secretary of the Yorkshire Federation of Building Trade Employers, Mr. S. Coop, president of the Dewsbury Master Builders' Association, Alderman Simpson, J.P., Alderman Judge, Alderman Atkinson, Mr. A. E. Greaves (hon. solicitor), Mr. A. S. Nicholson, and Mr. F. B. Ellison (architects), and Messrs. H. Fallas, E. A. Elvey, G. Crook, J. Pashley, J. W. Bramham, F. Clark, R. L. Leake, D. F. Parker, J. W. Sanderson, T. E. Senior, and others, the number present being 45.

Mr. A. E. Greaves proposed "The Mayor and Corporation," and Alderman Simpson responded.

Alderman Judge, in proposing "The Yorkshire Federation of Building Trade Employers," spoke of the benefits the Wakefied Association derived from being affiliated to the Yorkshire Association. As far as the Yorkshire Federation was concerned, they would not find that they had recommended that wages should be lower: they believed for a fair day's work a fair day's wage should be given. Speaking of the rising generation, Alderman Judge said it seemed as if they did not want to dirty their hands, but desired some occupation where they could go with a clean collar on: it was no use such young men entering the building trade.—Mr. W. R. Thompson (Dewsbury), responding, gave a résumé of the Federation's work during the past year. Although they had suffered from trade depression, it was very creditable to the master builders of Yorkshire that they had made no attempt to reduce the wages. Speaking of the prospects, he said the point they had to consider was, how could they strengthen their local association? He suggested that papers on practical subjects be read, and appealed for more unity in their work.—Mr. J. Davidson (Leeds) also responded, and referred to the assistance the Federation had received from the advice given by representatives from the local association.—Mr. W. T. Ledgard (Leeds) proposed "Success to the Wakefield and District Master Builders' Association." In responding, Mr. Tom Lee spoke of the agreeable manner in which the builders and local architects worked together. —Mr. H. Fallas also responded.

In proposing the toast of "The Architects," Alderman Atkinson spoke at length upon the state of the building trade in the city, and the excellent relations which existed between the architects and the builders.—Mr. A. S. Nicholson and Mr. F. B. Ellison also responded.

On the call of the president, the health of the mayor, who arrived late, was heartily drunk, and the mayor suitably responded.

NOTTINGHAM ASSOCIATION.

Secretary: W. J. Barton, F.C.I.S.

At the eighteenth annual general meeting of the Nottingham Association, Mr. Wm. Crane (vice-president) in the chair, a printed summary of the cash account for 1908 was placed in the hands of members, and on the proposition of Mr. Quarton, seconded by Mr. Fish, it was resolved that the same be received and adopted.

The hon. secretary (Mr. Jas. Wright) gave a very interesting account of the work accomplished by the Association and by the National Federation during the past year, and a hearty vote of thanks was accorded to Mr. Wright for his valuable services to the association, and to the trade generally.

The election of officers and committees for 1909 then took place, the following officers being appointed:—President, Mr. J. W. Woodsend; vice-president, Mr. Wm. Crane; treasurer, Mr. J. W. Woodsend; hon. secretary, Mr. Jas. Wright; auditor, Mr. F. Quarton.

In addition to the general, finance, and separate trades committees, an executive committee was formed from the members of the general committee, consisting of nine members, to deal with special matters as they arise, thus obviating the necessity of forming sub-committees from time to time.

Messrs. Quarton and Thompson were elected the association's representative of the Midland Centre.

Mr. H. R. Thompson then gave an instructive paper on the inter-trading rule, and a vote of thanks was accorded to him for the same. This question was then referred to the Executive Committee for further consideration, when the matter was to be again laid before a general meeting.

The chairman explained to the meeting that in some towns it had been arranged for the operatives to start work at 8 a.m. all the year round, and thus have only one break in the day. The members present were asked to think over this subject, and in the meantime the Executive Committee would further consider the matter, and bring it before a general meeting later.

BOLTON AND FARNWORTH ASSOCIATION.

Secretary: J. R. Vose, F.C.I.S.

The members of the Bolton and Farnworth Building Trades Employers' Association held their annual dinner at the Halliwell Lodge Hotel, under the chairmanship of Mr. Ben. Talbot (president). Mr. W. Bullen, president of the Lancashire and Cheshire Building Trades Employers' Association, and Councillors Morris and P. Higson were of the company. After the usual loyal toast, "The Lancashire and Cheshire Federation of Building Trades Employers" was submitted by Mr. Percy Townson, who stated that there were 32 towns federated, with 2,200 members and 600 hon. members. Mr. W. Bullen responded, remarking that county associations and federations were extremely useful in protecting the small builder, who might otherwise be helpless against persecution. Personally he should feel that they had not completed their work until they had all members of the branches of the trade inside their Federation, and thus prevent the cut-throat competition which too often prevailed.—The president proposed the toast of the "National Federation of Building Trades Employers." They owed, he said, a great debt of gratitude to the Federation, without which they would be helpless units.. Mr. Frank Woods responded, eulogising the broad democratic basis upon which the National Federation was elected. One good point of the National was the reserve fund which was being built up, which enabled them to fight most important cases in the law courts. He hoped that Bolton would raise its quota towards the reserve fund.—Mr. Crossley proposed the "Bolton and Farnworth Building Trades Employers' Association." Mr. Coope, Farnworth, one of the vice-presidents, responded. Mr. F. Woods proposed the Mayor and Corporation of Bolton, which was responded to by Councillors Morris and Higson; and the last toast was by Mr. W. Kay, "The Building and General Trade of Bolton."

BRADFORD ASSOCIATION.

Secretary: J. Davidson.

A meeting of the Bradford Association was held on February 23rd. In the absence of Mr. Taylor through illness, Mr. R. Raper, senior vice-president, occupied the chair.

The treasurer presented his report, and several accounts were passed for payment, including the subscription to the Yorkshire Federation and the proportion payable by the association to the National reserve fund.

The attention of the members was drawn to the recent experiences of building trade employers with architects. A case was cited in which an employer had not yet been paid off for two works which had been completed three or four years ago. It was felt that this matter was worthy of careful consideration, with a view to concerted action.

A member mentioned a difficulty which he experienced with respect to wages being paid to workmen engaged on night shifts, and several members explained the custom which had hitherto prevailed in connection with this matter.

HULL ASSOCIATION.

Hon. Secretary: A. Peers.

A whist drive in connection with the Hull Association was held at the Octagon Cafe, King Edward Street, when upwards of 200 members and friends were present, 32 hands being played.

It has been decided to erect a drinking fountain for animals at Bury St. Edmunds as a memorial to "Ouida."

EMPLOYERS AND THE HOUSE OF LORDS.

At a meeting of the Employers' Parliamentary Council, held at Westminster, a relution was adopted in support of the following motion which the Earl of Wemyss will bring forward in the House of Lords in the forthcoming session:—1.—That in the opinion of this House it would be for the public good that important national trading and other organisations and societies should each name three Peers in the current and each succeeding Parliament to speak and act on behalf of such societies in all questions in which they are interested, and that the names of the Peers so nominated be entered in the Journals of the House. 2.—That the Lord Chancellor, the Marquess of Lansdowne, the Earl of Crewe, and the Earl of Halsbury, be empowered to determine what societies are of sufficient importance to be admitted to the said privilege of nomination. 3.—That no Peer shall be entitled to vote on any public question who has not attended 20 sittings in the current or previous session of the House.

Proposed New Works.

ASHTON, WIGAN.—At a meeting of the Buildings, Highways, and Streets Committee the surveyor reported that he had prepared plans and estimates as instructed for the suggested widening of the roadway on Billinge Road, near the Sanitary Depot; and he had also prepared plans and estimates for a suggested widening on the same road at the Downall Green End. It was resolved that the following plans be approved:—N. Adamson, house, Rectory Road; the Managers, Rectory Schools, amended plan, Rectory Road.

BELFAST.—Mr. P. C. Cowan, M.Inst. C.E., chief engineering inspector of the Local Government Board, has held an enquiry here with reference to an application by the corporation for leave to borrow £8,000 and £75,000 for the purpose of extending the lunatic asylum at Purdysburn.

ELGIN.—The town council have resolved to erect new baths in Cooper Park at an expense not exceeding £4,000. It was decided to invite designs from a local architect.

FENTON, STAFFS.—Amongst plans recently passed by the Fenton Urban Council were those of six houses in Church Street, and of six houses in Tirley Street, for Messrs. Challinor and Hughes. The surveyor was instructed to advertise for tenders for the erection of a disinfection station, steam-roller house, fire-engine house, and residence at the Town Yard. It was announced that the Local Government Board has sanctioned the borrowing of £3,770 and £230, required for the provision of an elementary school at Manor Street.

MELROSE.—Plans of the proposed new church have been prepared by Mr. J. M. Dick Peddie, architect, Edinburgh, and have been approved of by the heritors of the parish.

NORWICH.—The Baptist community propose to build a church and schools at a cost of about £6,000.

ROCHDALE.—At a recent meeting of the Buildings, Baths, and Parks Committee of the Rochdale Corporation, plans for 30 new houses were passed.

WESTMINSTER. — Middlesex County Council has agreed to obtain the advice of an expert respecting a proposal to demolish the Guildhall, Westminster, and to erect a new structure on the same site and the adjoining ground belonging to the Council.

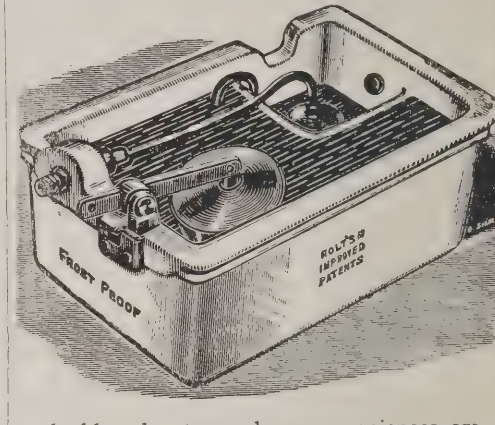
WHITTINGHAM, LANCS.—The Lancaster Asylums Board have formally approved of the plans prepared by Messrs. Sykes and Evans for the erection of a new annexe at Whittingham Asylum. The required accommodation is for 700 patients.

WORTHING.—The directors of the Worthing Pier Company have adopted a scheme for the enlargement and improvement of the pier. The work is estimated to cost approximately £8,500.

Trade and Craft.

Holt's Patent Syphon Cistern.

In Holt's cistern, of which an illustration is here given, the distance between the water-level and the top of the syphon is no more than a quarter of an inch, and never varies. This condition enables the use of a loose-fitting bell, which is always sensitive and reliable in action. No violent destructive pull is necessary in order to start the syphon, and consequently there is no waste of water, time, and temper. The many architects and others who have recorded their satisfaction with these cisterns nearly always mention the ease and certainty with which they respond to the pull of the chain, and the rapidity of refilling after each flush, which is an especially valuable advantage where conveniences are used in quick succession. Prof. H. J. Hele Shaw testifies that these cisterns have been fitted throughout the Victoria building and the Walker Engineering laboratories at University College, Liverpool, and that during the ten years or so during which they have been in operation there has never been any trouble with them. Professor Shaw considers that the use of a separate ball chamber, enabling the syphon to be placed in a compartment by itself, is a valuable and an important invention, as it results in the flushing charge being always constant, whether the ball-tap be in repair or not. This cistern entirely dispenses with valves or other working parts that are likely to get out of order; and the simplicity and strength of the apparatus will be plainly evident from the accompanying illustration. The afterflush is automatic; and Mr. Frank Gray Wallis, the architect, records that "during the late frost an unexpected advantage appeared. The water being slightly frozen, when the cistern was emptied by a flush, the ball chamber did not syphon, and the cistern remained empty, and so protected from the severe frost which followed and broke many other cisterns." The firm publish a long list of important buildings in which their cistern has been adopted. Particulars may be obtained from "Holt's Patents," 3, Smithfield Street, Liverpool.



* * *

Mr. Wm. MacIrvine (formerly of Nottingham) has been appointed managing representative to Messrs. P. Aspinall and Son, stone merchants and masonry contractors, of Finsbury Park, N., who, we are informed, are supplying the whole of the stonework required for the alterations to the Holborn Old Town Hall. All work undertaken by the firm is dealt with under the joint personal supervision of Mr. MacIrvine and Mr. Mark Lemon, the managing director.

* * *

In the notice, under the heading "Our Plate," on page 173 of our issue of February 24th, of the work executed at the East Riding County Council Offices, by Messrs. Diespeker, Limited, whose head office is at 57-60, Holborn Viaduct, E.C., the style of that firm should have been as here rendered.

A LIFE EXPERIENCE **THE COLLECTOR AND BUDD'S PATENT SYSTEM.** **For 5s. 2d.**

COMPETITION DEMANDS SUCH A WORK AS OFFERED HERE.

THE SAFEGUARD (can be started any week, and no waiting required). THE PRACTICAL SHORT CUT TO OFFICE ROUTINE. **50 per cent.** of clerical labour saved. Not one penny can be lost. **Book-keeping dispensed with for practical workings.** **"Unique."** A great money saver, and the most simple, accurate, and genuine work that can be put before the public. Thousands of copies sold, and unsolicited testimonials coming daily to hand from all over England. ATTENTION *is called to the following Editors' letters to their readers. The Editor of the "Carpenter & Builder" says "A large number of letters have been examined by us re 'The Collector System' all of which afford a remarkable testimony and very general approval of the work. The system is found to be both simple and complete, and many of the correspondents are quite enthusiastic in their expressions of appreciation." The Editor of "The Building World" says "We have seen a large number of original letters in which the writers express their great satisfaction and high appreciation for 'The Collector.'" The Editor of "The Decorator" says "The owner of 'The Collector' produces a number of testimonials from those who have tried it in favour of this improved system of book-keeping." All Cheques and Postal Orders to be crossed and made payable to "The Collector Office" and addressed 19, Henniker Gardens, East Ham, E.*

Practical Notes for Architectural Draughtsmen.
By ALFRED W. S. CROSS, M.A., F.R.I.B.A.,
and ALAN E. MUNBY, M.A., A.R.I.B.A.

Complete Set (27 Large Plates in a Portfolio), 12s.
POST FREE, 12s. 6d.

Prof. C. H. REILLY, of Liverpool University, says: "I think it is a very valuable book, and I hope it will find its way into most architectural offices."

THE "PRACTICAL NOTES" gives in most convenient form for use on the drawing board examples with concise rules, explanations and dimensions for preparing Designs, Perspectives and Working Drawings for Classical Architecture with rapidity and precision.

STUDENTS preparing for the examinations of the R.I.B.A. can learn how to draw The Orders correctly with the smallest possible amount of study and work by utilising the invaluable drawings and data given in this publication.

We shall be pleased to forward a copy of this work on approval to any of our subscribers.

Sole Concessionaires: Aug. Brennecke & Co., 68 Finsbury Pavement, London, E.C.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

March 3-15. TIDWORTH (HANTS.).—Erection of a forage barn and riding school at Tidworth Hants., in the southern command. For plans, specification, and conditions of contract at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., or at the Barrack Construction office, Tidworth, Hants., up to March 3. Apply to the Director of Barrack Construction by March 5 for bills of quantities, deposit 10s. Cheques or orders payable to the assistant financial secretary, and crossed "Bank of England for Credit to Army Funds." Tenders marked "Tender for Forage Barn and Riding School, Tidworth," by noon on March 15, to H. de la Bere, director of Army contracts, War Office, Whitehall, London, S.W.

March 3-15. LONDON.—Erection of new bridge and covered way between R.A.M. College and Laboratories, also museum, sanitary fittings, and alterations and additions to water supply at Millbank, S.W., for the Secretary of State for War. Plans, specification, and conditions of contract at the office of the Director of Barrack Construction, 80, Pall Mall, London, S.W., up to March 3. Apply to the Director of Barrack Construction by March 5 for bills of quantities, 10s. deposit. Cheques or orders payable to the assistant financial secretary, and crossed "Bank of England for Credit to Army Funds, etc." Tenders marked "Tender for New Bridge, etc., Millbank, S.W.," by noon on March 15th, to H. de la Bere, director of army contracts, War Office, Whitehall, London, S.W.

March 4. SELBY.—Erection of a caretaker's cottage and outbuildings at the school, Gowthorpe House, for the governors of the Selby secondary school for girls. Plans, specifications, and further information at the office of J. H. Bantoft, clerk to the governors, 33, Finkle Street, Selby. Sole tenders only considered, and contractors to take off their own quantities. Tenders, on form supplied, to the clerk of the governors by noon on March 4.

March 4. TREDEGAR (MON.)—Erection of a new vicarage for the parish of St. James's, Tredegar (Mon.), for the Rev. G. E. H. Theophilus. Plans and specifications at the office of A. F. Webb, architect, Blackwood (Mon.), and bills of quantities upon deposit of £1 1s. Tenders to the vicar by March 4.

March 5-20. BITTON (NEAR BRISTOL).—Erection of a new elementary school at Bitton, for the Gloucestershire education committee. Bills of quantities upon deposit of £2 2s., of R. S. Phillips, architect, Midland Bank Chambers, The Cross, Gloucester. Applications by March 5, and tenders by 9 a.m., on March 20.

Forms of tender on application to Arthur S. Duffield, clerk, 96, High Street, Chelmsford, to whom tenders must be returned by March 22.

March 22. ECCLES.—Supplying for the year ending March 31, 1910:—Setts (granite, grit, lonkey paving, crossing and flag rock), flags (best and seconds barns), concrete, manhole, lampeye, and gully, kerbs (rough, straight, and circular), channel stones (straight and circular), broken rubble (per ton), granite macadam and chippings, prepared tarred limestone, limestone cube chippings, gravel (pit or river, per ton), castings, pitch, creosote, and tar, Simpson's patent street gullies, stoneware passage gullies, stoneware pipes, bends, and junctions, cinders (per ton), mortar (per ton), for the corporation. Forms of tender and particulars on application to Thomas S. Picton, C.E., borough engineer, Eccles. Tenders, endorsed "Tender for Highway Materials," by noon, on March 22, to Edwin Parkes, town clerk, town hall, Eccles. Samples of all materials must be supplied, carriage paid, to the borough engineer, by March 25.

MISCELLANEOUS.

March 8. PONTYPRIDD.—Laying out, draining, enclosing for burial purposes, etc., about 9 acres of land adjoining the Glyntaff cemetery, Treforest, for the burial board. Drawings and specification at the office of the architects, A. O. Evans, William, and Evans, Pontypridd, and bills of quantities on deposit of £2 2s. Tenders, endorsed "Cemetery Extension," by March 8, to James E. Spickett, clerk to the burial board, Pontypridd.

March 9. LEEDS.—Supplying the following during the year ending March 31, 1910, for the corporation:—Cement, sewer ironwork, sewer, and drain pipes, gullies, etc. Specifications and forms of tender with W. T. Lancashire, city engineer, municipal buildings, Leeds. Tenders to the town clerk, town hall, Leeds, by 10 a.m., on March 9.

March 12. ROMNEY MARSH.—Stopping and lime-washing the workhouse and buildings for the guardians. Forms of tender can be obtained upon application to the master of the workhouse at New Romney. Tenders to be submitted by March 12.

March 19. SUTTON COLDFIELD.—Supplying following materials during year ending March 31, 1910, for the corporation:—Granite macadam kerb, limestone macadam and setts, gravel and broken pebble stones, Yorkshire or Pennant kerb, Rowley setts, earthenware pipes, cement and lime, iron castings, iron and steel, timber, hardware, oils and paint, bass brooms. Conditions of contract and forms of tender of W. A. H. Clarry, A.M.Inst.C.E., borough surveyor, council house, Sutton Coldfield. Tenders by March 19, endorsed "Tender for Materials."

THE
Federated Employers' Insurance Association, Ltd.

HEAD OFFICES:
30, Cross Street, MANCHESTER.

Non-Tariff—Founded by Builders.

THIS ASSOCIATION GUARANTEES THE DUE PERFORMANCE OF CONTRACTS and invites enquiries from Contractors in matters incident thereto. Negotiations tend to prompt and effective arrangements.

BUILDERS' RISKS so far as WORKMEN'S COMPENSATION AND PUBLIC LIABILITY are concerned form special features in connection with the Association's operations. Moderate Rates and equitable conditions apply.

FIRE, PERSONAL ACCIDENT AND ILLNESS, and miscellaneous Insurances are transacted.

Submit enquiries.

Federation Secretaries are invited to apply for an Agency

GEO. L. DREW,
General Manager and Secretary.

Telephone: 5948 Manchester.
Telegraph: "Federated, Manchester."

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ADVERTISER (28), seeks re-engagement, ten years' thorough practical knowledge of building, estate management, and repairs, etc.; experienced in preparing plans and estimates, including quantities, for new works: highest refs. — Y., 86, Coniston Road, Muswell Hill, N. 4805

ADVERTISER (27), Architect and Surveyor, recently returned from Sudan, after completing engagement, desires position as architect or manager to building estate.—Baratt, Hollyrood House, Gravelly Hill, North, Birmingham. 4842

ARCHITECT'S Assistant desires engagement, finalist R.I.B.A.; design, details, specifications, 1st class honours, quantity surveying, honours (Part 1), building construction, artistic and practical; moderate salary.—Address Architect, 24, Brunswick Street, C.-on-M., Manchester. 4871

ARCHITECT'S Assistant (23), excellent Draughtsman, desires re-engagement; London preferred; six years' first-class experience town and country work; contract, detail, and competition drawings; exhibitor Royal Academy; Prizeman for Architectural Design; small salary.—F. E., 10, Cobham Road, Kingston-on-Thames. 4876

ARCHITECT'S Assistant (23), desires engagement; 7 years' eaxperience.—Sedgwick, Belvedere Road, Sunderland.

ARCHITECT and Surveyor's Assistant (25), 9 years' experience; excellent draughtsman, working drawings, details, specifications, perspectives, surveying, French, typewriting; moderate salary.—Arthur Bailey, 26, North Street, Hailsham, Sussex. 4819

ARCHITECTS, Builders, etc., draughtsman (19), used to general work, fill up time in office; good references.—F. J. Williams, c/o F. Cundall, Architect and Surveyor, 34, Parade, Leamington Spa. 4878

ARCHITECT'S Assistant (22), six years' experience; student R.I.B.A., good draughtsman, contract drawings, details, surveying, etc.; assist with quantities; salary moderate.—J. J. S., 1, Silver Street, Stockton-on-Tees. 4888

ARCHITECT'S good all-round Assistant; 10 yrs.' exp. North, South, and Wales; quans., details, working drawings; mod. salary.—W. T., 14, Stanhope Road, Stockton-on-Tees. 4798

ARCHITECT'S Assistant, 23, 6 years' experience in various London offices, good references; moderate salary.—G.O.E., 72, St. Ann's Hill, Wandsworth, S.W. 4881

ARCHITECT and Surveyor's Assistant (21), seeks re-engagement; 5 years' experience in church and domestic work in larger provincial office; good draughtsman and colourist.—Box 4823, Builders' Journal Office.

ARCHITECT'S Junior Assistant (19), 4 years experience in West End Office, working drawings, details, perspectives, competitions, excellent references; salary 21s.—Box 4777, Builders' Journal Office.

ARCHITECT'S and Surveyor's Assistant, 15 years' good practical experience; excellent draughtsman, designer and colourist; working drawings, details, specifications, surveying, levelling and general routine; excellent references; moderate salary.—A. R., 1, Ivy Villas, Cheam, Surrey. 4862

ARCHITECT'S, Surveyor's or Builder's Assistant (23), Inter.R.I.B.A., good draughtsman, levelling, surveying, specifications, assist quantities, supervision, estate work, correspondence, accounts; excellent references; moderate salary.—H. O'R., 80, Lavender Sweep, Clapham, S.W. 4810

ARCHITECT'S Assistant, thoroughly experienced, temporary employment; domestic work, business premises, schools, etc.; surveying and levelling, etc.; two years' experience in Structural Engineer's office; salary moderate. — Box 4820, Builders' Journal Office.

ARCHITECT'S Junior Assistant disengaged, 4½ years' articles, wishes to meet with architect in Lancashire office; specimen drawings, certificates for construction; sitting for Inter. R.I.B.A., June.—Apply, J. S. H., Wittington Lane, New Springs, Wigan. 4815

ARCHITECT, estate agent, or builder's assistant, experienced in all branches; good references.—R. S., Eagle House, Marine Parade, Clacton-on-Sea. 4816

ARCHITECTS, and builders, experienced surveyor open to prepare quantities and estimates, check accounts and measuring; moderate terms.—Apply Box 4817, Builders' Journal Office.

ASSISTANT Draughtsman disengaged, student R.I.B.A.; prizeman in classic and mechanics, A.A.; good all-round London experience; salary 20s.—148, Shooter's Hill Road, S.E. 4864

ASSISTANT A.R.I.B.A. (29), 14 years' London and Provincial experience; working drawings, details, specifications, supervision, perspectives, assist quantities, well up in management; testimonials; references; salary, 2 guineas.—Apply A, 31, Cotswold Road, Westcliff-on-Sea, Essex. 4775

BUILDERS' Assistant desires situation; thorough knowledge plans, specifications, quantities, measuring; not afraid of work; salary not so much an object as permanent situation; 21; 5 years' experience.—Box 4839, Builders' Journal Office.

BUILDER'S Assistant or Manager; thoroughly efficient; moderate salary if prospect of hard work and exceptional ability being recognised; 23 years' experience.--Alpha, 191, Park Crescent, Grimsby. 4877

BUILDERS', Surveyors' Assistant (24), capable and reliable, seeks re-engagement, thorough practical knowledge of construction, surveying, measuring up, good draughtsman, supervision, also costs, accounts, wages, etc.; mod. sal.—Box 4841, Builders' Journal Office.

BUILDERS' Assistant desires work; plans, estimates, setting out buildings, measuring up, prime costing, surveying, and levelling plots, ordering exact quantities, materials; 11 years' experience.—Box 4803, Builders' Journal Office.

BUILDER'S or Architect's Junior Assistant (18), good tracer, well up in prime cost, and general office work; excellent references; three years' experience. — J. W., 164, Wellesley Road, Ilford, Essex. 4833

BUILDER'S clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4883

CLERK of Works seeks re-engagement; just finishing public building; varied experience, notably ferro-concrete construction; well recommended; testimonials most excellent; age 45.—A. B., Box 4814, Builders' Journal Office

DRAUGHTSMAN (junior), 5 years' experience in structural engineers, good knowledge of constructional and ornamental work, details, quantities and estimating; shop experience.—M.D., 74, Bartholomew Road, London, N.W. 4884

DRAUGHTSMAN, neat, quick tracer, working drawings from rough sketches, good colourist; shorthand, typing, etc.; about 12 years' varied experience; terms moderate.—Box No. 4889, Builders' Journal Office.

ESTATE, **Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, Builders' Journal Office.**

ESTATE Owners.—Bricklayer, all-round, stone-waller, and general repairs; abstainer; good references; moderate wage for permanency.—Quinton, 12, Holland Road, Aston, Birmingham. 4802

FIREPROOF **Engineers and Concrete Specialists. Advertiser, connected with above trades for 10 years, and whose name is well known in connection with same, desires position as manager, traveller, or head clerk; first-class book-keeper; aged 33; very moderate salary.—P. W. Potter, 73, Penshurst Road, Thornton Heath. 4719**

FIRST Class Architectural Designer and Draughtsman, artistic and practical, experienced in planning; elevations and details, office and competition work; moderate salary.—Apply Box 4792, Builders' Journal Office.

FOREMAN Painter (working) seeks re-engagement); experienced in all class work in building trade, as for general alterations, etc.; good supervisor, and reliable; either town or country; abstainer.—X. Y. Z., 8, Barton Street, Westminster. 4807

GENERAL Foreman seeks re-engagement, thoroughly practical in all branches; trade, carpenter and joiner, good draughtsman, first class references; town or country.—A. J., 196, Murchison Road, Leyton. 4804

GENERAL Foreman seeks re-engagement; alterations or new, practical experience in all branches; carpenter and joiner; good references; age 36; moderate wages.—Caplen, 3, Victoria Mansion, Edgware Road, Paddington, W. 4779

GENERAL Foreman seeks re-engagement, thoroughly practical and reliable; new or alterations; carpenter and joiner; life abstainer; first-class references.—Foreman, 3, Hawbridge Road, Leytonstone. 4787

GENERAL or builder's foreman, energetic, reliable, good timekeeper, trade bricklayer; age 32. Good refs.—G. C., 44, Richmond Park Road, Kingston-on-Thames. 4863

JUNIOR **Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, Builders' Journal Office.**

MACHINIST seeks situation; spindle fourcutter, etc.; married, age 32; total abstainer and good timekeeper.—Machinist, 46, Priory Street, Tonbridge, Kent. 4874

PAINTING, paperhanging, distempering, graining wanted, piecework, new work at greatly reduced prices; specimen showing architects' and surveyors' testimonials for quality and cheapness.—Galton, 6, Parolles Road, Upper Holloway, N. 4861

PLASTERER, good jobbing bricklayer, roofs, fire work, stoves, tiling, etc., etc., generally useful, good reference, moderate wages, non-union.—A. Trigg, 117, St. John's Hill, Clapham Junction, S.W. 4856

QUANTITY Surveyor's Assistant (21), 4 years' experience, desires engagement, certificates and good references. — Apply Box 4745, Builders' Journal Office.

QUANTITY, General Surveyor's Junior Assistant, four years' experience; working up measuring existing buildings, good draughtsmen, little estate work; City Poly student.—J. R. O., 233, Essex Road, N. 4844

REINFORCED CONCRETE.—Details, drawings, calculations, and assistance generally, rendered to architects, builders, etc., by a specialist of large experience; terms moderate.—Box 4887, Builders' Journal Office.

SURVEYOR'S Assistant seeks re-engagement, 9 years with City firm; highest references; surveys; levels, estate management, etc.; shorthand and typewriting, if necessary. — J. P. K., 21, First Avenue, Manor Park, Essex. 4873

TO Estate Owners, builder, experience, in all trades, desires position as manager (working or otherwise); plans prepared, quantities, setting out, accounts and supervision; abstainer; country preferred.—Box 4806, Builders' Journal Office.

VOLONTAIRE.—Foreign gentleman (21) desires position in builder's office, with opportunity of learning.—B. B., 43, Bolingbroke Grove, Wandsworth Common, S.W. 4789

YOUNG Gentleman, with good business pushing qualities, wants situation, experienced buyer in quick selling lines; timber, matchings, joinery, mouldings, etc.; building materials, ironmongery, oils, colours, glass, garden requisites, practical experience, good references; will manage small cash business and develope it. — Box 4872, Builders' Journal Office.

Appointments Vacant.

ARTICLED Pupil, reinforced concrete. Required, a young gentleman as articled pupil in reinforced concrete specialist's office; one with knowledge of Elemen. Applied Mechanics and mathematics, and a taste for theory of construction and design preferred; an excellent opportunity for one willing to learn and understudy chief engineer.—Write, R.C., c/o Hastings Bros., Ltd., King's Chambers, Portugal Stret, W.C. 4886

PARTNERSHIP.—Builder and contractor (established), employing workmen for all trades, at present engaged in developing the town council's new estate in an important and flourishing seaside resort on East Coast, requires experienced young man (some capital necessary), for a partner.—Apply first (in confidence) with particulars to Box 4870, Builders' Journal Office.

WANTED, young engineer for abroad; knowledge and experience of reinforced concrete and constructural engineering essential; commercial experience an advantage; good prospects for a suitable man. —Reply, with full particulars, to Z.Z., 407, Messrs. Deacon's, Leadenhall Street, E.C. 4866

WANTED immediately, one or two good men thoroughly experienced in composition floor-laying. —Apply, giving experience and wages required, Box 4860, Builders' Journal Office.

March 10, 1909. Volume 29. No. 10.

Government Fair Wages Clause. We draw attention to an article which appears on page 211, dealing with the resolution to be moved in the House of Commons to-night (Wednesday) by Mr. Hodge, M.P. Like many other resolutions that are brought before our legislative bodies, this motion is very drastic, or is badly drafted. The intention is either to force contractors for Government works to pay the rates of wages dictated by the various trade unions, whatever figures they may decide upon, in which case the rates of wages agreed upon between masters and men will, so far as Government work is concerned, be swept aside; or there is a desire to make all contractors conform to the agreed rates, in which case the motion is badly drawn, and liable to be productive of disputes over the exact meaning, among other things, of the words, "Trade Societies." Moreover, the motion would override the main conclusion of a report recently rendered by a Treasury Committee appointed to consider the working of the Fair Wages Resolution of the House of Commons, of February 13th, 1901. It is to be hoped, therefore, that the present fair wages clause employed in Government Departmental contracts will be retained. To do otherwise is to stultify the careful consideration and recommendations of the Committee referred to for no appreciable benefit—unless it be to the trades unions. And in such case to bring forward this motion at a time of acute depression seems likely to frustrate its object. With prices so low and so little work going, it is too much to expect that a provision which must increase the cost of building at any rate, will result in an increase of work and wages.

The Building and Engineering Works Bill. "The Building and Engineering Works Bill," or as it was termed last year on its first introduction, "The Building Operations and Engineering Works Bill," has again been presented to the House of Commons by Mr. Secretary Gladstone. On this occasion it is seen that the name of Mr. Herbert Samuel, the Under-Secretary for the Home Office, is concerned with its re-appearance, and this probably means that a determined effort is to be made to pass it on this occasion. A comparison of the present Bill with that of last year reveals a few alterations in the drafting, but they are chiefly those which would appeal to a grammarian. The object and administration of the proposed Act are, however, chiefly worth our notice, and in these respects no particular change is to be recorded. The principal alteration is undoubtedly that the power to act on Crown buildings is not to be transferred to the local authorities as is proposed for works in general. We disagree entirely with the intention to hand over to the District Councils any of the powers so proposed, on the grounds which we have already expressed in these columns, viz., that a danger of local influence will creep into local administration, and also that consistency of inspection can only be gained by centralisation of authority. It is true, as Mr. Samuel pointed out when presenting the Bill, that the factory inspectors have power to act in default of the local authorities, but that they, in the multiplicity of their duties, will do so, we decline to believe. But supposing we are in error, a question is raised which from the builders' point of view is of extreme importance. Is the trade to be inspected by local inspectors and again by the Home Office inspectors in order to ascertain that the district official is doing his duty? This is harassing with a vengeance, and the Home Secretary should be aware of the fact.

The Guild of Architects' Assistants. At the meeting of Thursday week last, reported in the present issue, the new Guild of Architects' Assistants was formally ushered into existence. We heartily welcome the new body, and sincerely trust that it will solve successfully the many and difficult problems that lie before it. Mr. Ernest Dixon, the indefatigable organiser of the new movement, propounded at some length the objects which he and those with him, had in view; but at the moment it is impossible to fully realise the extent and probable effect of this programme, which may indeed be modified and improved by the provisional committee which was then appointed. Still, as accessories before the fact (for the new body appears as the result to some degree of the recent articles and discussion in our columns on "The Architectural Profession of To-day") we should like to emphasize one or two points that were brought up in the course of the evening, and which, we think, should have due consideration in the councils of the Guild. They arise mainly from Mr. Max Clarke's remark that the ruling policy of the R.I.B.A. was "Architecture as an Art;" of the Architectural Association—Education; and of the Society of Architects—Registration. Mr. Dixon, in his opening speech, appeared to deprecate a consideration of "Architecture as an Art;" and we should be loth to support any policy that dethroned architecture from the position, not merely of an art, but of mother of the arts. That may seem to many to be an unattainable ideal; but certainly it is one that all architectural societies and, most of all, new societies, should foster. These three propositions—"Architecture an Art," Education, and Registration—are not really inimical to each other; it is the narrow interpretation which controversialists have placed upon them that divides the architectural profession into warring and opposing camps. Apparently, if we follow the principle of architecture as an Art, and we desire to do so, we are at once confronted with implied, if not expressed, propositions that the artist is exempt from, or should be oblivious to, the material necessities of his fellow-men; that unfair competition and harassing conditions of life and employment must necessarily be his portion; and that the way to great art is along a road strewn with wasted hopes and wrecked lives. Nothing may be done to limit numbers in an already overcrowded profession by the imposition of a severe test of general culture and technical knowledge as a condition of admittance to its ranks; no effort may be made to limit competition to the fair rivalry of brother artists; and no conditions may be laid down to render more amenable the lot of the assistants and budding architects who are striving for an honourable place in the exercise of their art. We hold with no such conclusions. The times have changed and require stronger measures, and we have to deal with the practical necessities of the day. The paternal guidance of the Old Crafts Guilds and the helpful interest of the Mid-Victorian principal have long ago been swept away. To-day many offices are run entirely with pupils, who, when time-expired, are turned out to make way for others. Assistants are taken on for some special work in hand, and, this completed, are dismissed once more to swell the ranks of those in casual employment. The old bohemian *camaraderie*, as Du Maurier depicted it in the Latin Quartier, has practically disappeared here, and in architectural circles never existed. Small wonder then that the assistants should be driven to combination to defend their interests and grapple with abuses which fairly threaten to drive them into the ranks of casual labourers. For such evils, and to check the overflowing stream of newcomers into an already overcrowded profession, registration has been prescribed as a potent remedy. By closing the gates, the leaders will be enabled to supervise those within, and regulate the admission of others without. By registration the predominance of the leading men would in no wise be disturbed. The fact that there are thousands of general medical practitioners throughout the country in no wise lessens the necessity for specialists in Harley Street, or the wisdom of keeping the medical profession a closed one. The unknown barrister defending some hapless prisoner at the request of an assize judge cannot dim the lustre that attaches to the leaders of his profession. Registration does not, and necessarily cannot, regulate genius, but it can supervise mediocrity and exclude incompetence. It deals and aims to deal with material interests; and it is the obstinate refusal of a certain section of the body politic to recognise the existence of a material side to the architect's life that militates against the introduction of the inevitable remedy. Starving genius has proclaimed itself from the garret; but the romantic instances recorded were never architects, and seldom sculptors. The architect's work is too long and too slow in doing, and no good result can be expected unless he is enabled to live under reasonable conditions of comfort.

Porosity and Paradox.

Dr. James Braithwaite, M.D., has contributed to the "Evening News" an article on "Damp in the Home," to which title the sub-editor (apparently, for your newspaper sub-editor dearly loves a paradoxical caption) has made the addendum, "Why Wet Clay Means Dry Walls." Rooms added to the doctor's house in 1873 are damp. The bricks in this addition are, "to the eye, faultless, having smooth, almost shining surfaces, and sharp clear-cut edges and corners." Yet the rooms are exceedingly damp, and the doctor explains that "the damp comes through the walls, not up from the ground." The main building, however, which was put up in 1865, and is of bricks that were "machine-made from damp clay," is dry and comfortable; but its north wall "is damp, or becomes so in any place against which an article of furniture is placed, showing that the bricks always contain moisture, and are only not visibly damp on account of constant evaporation into the house." The doctor mentions similar cases that he has observed; and he thinks that they all tend "to prove the water-carrying power of bricks perfect in appearance." "I believe, however," he adds, "that this porosity or sponge-like character is only found in bricks made from merely damp clay, and never in those made from really wet clay," because, "however great the pressure, it is impossible to squeeze out the air which remains in the minute hair-like canals which represent the old lines of separation between the bits of dryish or damp clay of which the brick was originally composed. The smaller these canals the more deadly they are, for they absorb by capillary (*capilla* a hair) attraction quicker and more certainly. No house built of wet clay bricks is damp, owing to the important fact that they are not porous and are damp-proof." We by no means assent to the doctor's conclusions; which, indeed, were promptly challenged by Mr. Arthur E. Brown, B.Sc., who points out, what must be perfectly obvious to the expert reader, that the dampness observed is not due to the porosity or permeability of the brick, but rather to the opposite quality, which Mr. Brown aptly describes as "lack of breathing power." The dampness is no doubt condensed from the internal atmosphere; and, obviously, the more impervious the brick, the less the evaporation. Similarly the water that almost streams down inside shop windows during the cold weather is not a proof of the porosity of the glass, but of the converse. Among architects it is simply a commonplace of elementary knowledge that the porosity of bricks renders the house healthy by providing it with a breathing apparatus, "analogous to the skin of the body, letting out noxious vapours and internal moisture, as well as letting in pure air from the outside;" while, as Mr. Brown observes, bricks, though made by the wet-clay process, may, if made of sandy clay, possess an open texture, and be so extremely absorbent that, when walls built with them are not exposed to excessive rains, and are protected by projecting eaves, they give off moisture with great rapidity after rainfall, so that the wet has no chance to reach the interior faces of the walls. The dampness that became visible on the doctor's north wall when an article of furniture was placed against it, does not, as he supposes, show "that the bricks always contain moisture" derived from outside, but rather that the furniture has stopped the pores by which the interior moisture would have been dissipated. These very elementary propositions having been established, it is unnecessary to go into the doctor's question as to the relative merits, from the hygienic point of view, of bricks made, respectively, from "merely damp clay" and from "really wet clay;" and the sub-editor's daring paradox expires heroically in the execution of its duty.

Borough Surveyor as Architect.

The latest instance of the friction that so frequently occurs in connection with official appointments comes from Loughborough, Leicestershire. At a meeting of Loughborough Town Council, Alderman Moss drew attention to a paragraph in the minutes of the General Purposes Committee relating to proposed alterations at the drill hall. Plans had been prepared by the borough surveyor, to whom it was proposed to allow a fee of five guineas. The alderman opposed the grant, as he considered that alterations to town buildings ought to be regarded as part of the surveyor's duties. The Mayor made the somewhat ambiguous remark that "this was not the surveyor's work, but was architectural work," whereupon the alderman retorted, "What is surveyor's work if it is not architectural? It should embrace all that sort of thing." This large generalisation did not find much favour. Another alderman said he "did not consider surveyors' work and architects' work were the same," and architects of the one part, and surveyors of the other part, will hasten to agree with him, although it is not easy to draw a very definite distinction. An architect is apt to plume himself on his skill as a surveyor, and, in revenge, a surveyor would scorn to think himself unequal to at least the minor operations of architecture. Each profession allows itself a sufficient amount of margin to permit of a certain amount of overlapping. The problem of whether a given official is more of the one and less of the other is far too subtle for solution by the average town councillor, or even an average alderman. One of the Loughborough councillors made a clean breast of his very pardonable ignorance by ejaculating, "I should like to know what his (the borough surveyor's) duties are." That is exactly the information for which we are all athirst. For our part, we see no reason to abandon our consistent contention that the function of such officials should be purely advisory and consultative; and therefore we take leave to say ditto to Councillor Phelps's protest: "I can't see why town officials should take away work from those outside who are capable of doing it." We are not sorry, however, that the minute was not referred back. As the surveyor had done the work, it was no more than just that he should be paid for it; although we must admit that our joy is somewhat chastened as we ponder the well-intentioned but desolating comment that an architect's fees for the work for which the borough surveyor was to be paid five guineas would probably have been £10. And why not guineas, Mr. Mayor?

New Council Schools, Barnsley.

The education committee invite application from architects desirous of taking part in a competition for the above schools, to be erected in Grove Street. Premiums, £30, £20, £10. Architects applying should submit particulars of school work already done. Forms of application can be obtained from W. P. Donald, secretary, education office, Barnsley, to whom they should be returned not later than Saturday, March 13th, 1909.

* * *

Messrs. Frederick Wheeler, Son and Searle are removing from 6, Staples Inn, London, W.C., to No. 7, Stone Buildings, Lincoln's Inn, London, W.C., to which address all communications should be sent after March 11th.

* * *

Mr. Edward P. Warren, F.R.I.B.A., F.S.A., is moving his offices from 20, Cowley Street, Dean's Yard, Westminster, to 20, Bedford Sqaure, W.C. (telephone 11897 Central), on and after March 22nd inst. His present offices will be closed during the 19th and 20th inst.

ROYAL ACADEMY EXHIBITION, 1909.

The day for sending in architectural drawings to Burlington House is Friday, March 26th, from 7 a.m. to 10 p.m. As in past years we shall be happy to act as agents for delivering drawings to the Academy on the condition that we are allowed to reproduce any of the designs passing through our hands prior to their being sent in. We should appreciate the kindness of architects in forwarding their drawings as early as possible, and would mention that we can obtain more satisfactory results in the reproduction when we have plenty of time at our disposal.

Drawings for exhibition in the architectural room should be glazed and should have gold frames. Each frame must have a ticket pasted on the back, giving the number, title of the work, and the architect's name and address, to correspond with the particulars given on the printed forms, which must be obtained from the secretary at the Royal Academy, Burlington House, Piccadilly, W., and there should be attached to each frame, by string, a printed label (also supplied by the Academy) so arranged that it may hang over the front of the drawing. The printed form of advice should in all cases be forwarded to us to hand to the secretary on delivery of the drawings. No exhibitor may send more than three works, and we should recommend intending exhibitors to avoid wide margins or mounts to the drawings, as space is a considerable factor in the arranging of the architectural exhibits.

GUILD OF ARCHITECTS' ASSISTANTS.

Inaugural Meeting.

A meeting of architects' assistants, for the purpose of inaugurating a guild for themselves, was held on Thursday week last, at the Tudor Hotel, Oxford Street, W., Mr. A. W. S. Cross, F.R.I.B.A., presiding over an excellent attendance.

Mr. E. J. DIXON, called upon by the Chairman to give a statement of the proposed constitution and objects of the Guild, said that all the existing architectural societies dealt primarily with the interests of the principals. The object he had in bringing forward the proposition for this Guild was to suggest some means of entirely reorganising the conditions under which the profession at the present time was carried on, with especial reference to the needs and wants of the assistants, and in bringing forward this Guild the idea was to combine for their own support, to better their conditions, to insure against the natural contingencies that their business brought with it, and at the same time to take up a broader point of view than that, and endeavour to show to the profession at large that an entire reorganisation was necessary, and that there was a competition between professions as well as between individuals. Any attempt at combination would evoke the remark, "Trade Unionism," and the two pet theses which were discussed *ad libitum* in the architectural societies, *i.e.*, architecture as an art, and education, would be brought against them at once. His private opinion of these two matters was that, however much they might respect the men who brought them forward, they must recognise the fact that architecture as an art was a purely abstract matter, and that any guild or combination of societies would not devote itself to the study of abstruse metaphysical questions such as that, but would direct its attention to the actual, practical conditions under which architecture was carried on at present. That would be the primary position of the Guild. It would take a broad outlook over the entire profession, and would recognise that what resulted in the betterment of the conditions under which the principal worked would inevitably react upon the assistants. He proposed, therefore, in framing the Guild, not to adopt trade-union tactics in any way, by creating two entire divisions in the profession, *i.e.*, the employers and the employed, but to take a larger outlook than that, to recognise the difficulties that the employer had to meet with in his practice. If those difficulties were properly met, the resulting conditions would benefit the assistant. He, therefore, formally stated the objects of the Guild in this manner: they were to unite all sections of the profession for mutual aid in progress and organisation, to form a common ground for the consideration of all questions dealing with the mutual relationship of the assistant and the principal, to assist its members in matters of improvement in their professional education, and in maintaining and improving their professional status. In the matter of education, they had had all sorts of complicated schemes which had never gone down to the root of things. It was a common thing to find that men who had passed examinations were not always by any means the best assistants. They as assistants had views on education of their own which had never been put forward, and which were likely to make assistants much

BRASS GATES FOR THE MAUSOLEUM OF THE LATE MAHARAJAH OF MYSORE. MADE BY TONKS AND CO., LTD. (See p. 205).

more useful to their principals, and to develop assistants on lines of their own, and at the same time be of more use to them if they should eventually attain to the happy heaven of a private practice than any of the present systems of education. That was an important point, and he thought if the Guild were formed it should direct itself to this problem. The constitution of the Guild he proposed in this manner. It was to be divided into branch societies, consisting of not more than 200 members in each, and governed by an executive council sitting in London, the architectural societies to be invited to send a representative to the executive council, and, in the case of branch committees, any local architectural societies to be similarly invited to do so; in the case where the invitation of the Guild was refused or met with no response, the vacancies to be filled by members of the general body. The executive council and all committees to be formed of principals and assistants in equal proportions; when the former were not available, their seats to be taken by assistants. In cases where a principal was not available within the Guild for election, and he had intimated his desire to assist in the work of the executive or the branch committees, he might be elected or co-opted by the existing council or committee, should continue in office for one year, and have equal voting power with his colleagues for that time. On the question of membership, any assistant who had held his present position or been in employment for nine months, was under forty years of age previous to entry, and could produce a certificate of good health from a duly appointed medical officer, could join, the membership being divided into three classes or more. The main point which developed the idea of a Guild was the question of a system of unemployment insurance. He had obtained from three or four insurance companies letters on this question, but most of them wanted a premium of 19s. 11d. in the pound, or said an insurance with that risk was impossible, so that the only thing he had to go upon was, not a system which was actuarially sound, but which was financially sound, and that was, perhaps, more important. One of the principal objects of the Guild in dealing with the question of insurance was also to deal with the question of employment generally, and here were some of the proposals with reference to employment. In each district he should advocate a branch committee, with each branch having about 200 members. The committee would manage an employment bureau, and lists of members requiring employment, together with their qualifications registered and guaranteed by the local guild committee. They would have in each district a body composed of principals and assistants, before whom assistants would place their qualifications, which would be judged in the order of age, capacity, personal references, and examination qualifications, and each candidate would produce before the Guild any evidences of his study and the manner in which he had occupied his time as an assistant, with the result that they would be able to get a guarantee of the capacity of each assistant from a recognised authority, and that, of course, would be to the interest of the principals. They often heard of principals who engaged assistants who were not quite what they wanted, but here they would have fuller information from people who had actually worked with an assistant, with the result that there would be a better guarantee. Employment advertisements could be answered by the Guild, and vacancies could be made known to the Guild by its members. Then the Guild could pay fares or advance any necessary money to members, providing, of course, that the funds permitted. His proposals in relation to unemployment insurance rested on this basis: in unorganised trades the present percentage of unemployment was 15 per cent., and in organised trades 8.5 per cent. They had, therefore, two points to bear in mind in forming the Guild. The first was to be careful to admit to membership only those men who were really capable assistants. There were two important reasons for that. The first was to properly fix the status of the Guild at a high standard, and the second was for financial reasons, because if the membership was composed of capable men, what he called the unemployed coefficient was correspondingly reduced. In the National Union of Clerks the unemployed coefficient, *i.e.*, the ratio of unemployed members to the total membership, had reached its highest figure in the present year, and that was 2 per cent., and that would indicate to them the manner in which unemployment in an organisation might be kept down. He proposed to build up a reserve fund for each class, the amounts varying according to the class, by means of entrance fees and the first year's or six months' subscription, and to gauge the subscription to this unemployment fund in such a manner that it would provide for a certain definite unemployed coefficient, which he proposed should be 4 per cent. The arrived at that percentage by careful comparisons with similar organisations. One of the principal objects of the committee to be formed would be to deal with the present business of the Guild, and at the same time to discover by every possible means what was the condition of the various centres in regard to unemployment. Taking a membership of from 400 to 500, roughly speaking, the total amount of contributions to the Guild would be as follows:—First class (salaries over 3 guineas), 6s. per month subscription; second class (from 2 to 3 guineas), 4s. per month; and third class (from 1 to 2 guineas), 2s. per month. In return for that they would be able to supply each assistant with 40s., 30s., and 20s. in the three classes respectively for a period extending over six months. If they found their unemployed coefficient lower than 4 per cent., the period might be extended to a year, but that was a matter for the committee. No financial benefits of any kind would be allowed until six months' membership was completed, when half benefits would be allowed, the full benefits being allowed after twelve months' membership. The object of trade unionism was to divide a trade into two classes, distinctly at war with each other, but the object of a Guild—and that was why he chose the title —was to take a wider outlook altogether, and to show that if the employer benefited in any way, that was likely to turn to the benefit of the assistant as well in the long run. He sent out a letter briefly stating the objects of the Guild, and suggesting the manner in which he should deal with the question of the organisation of the profession at large. In connection with this point, it could not be too much enforced upon them that the majority of the members of the existing societies were assistants, and that was important. If assistants combined with the object of improving the status of the profession, and necessarily, from the point of view of all impartial employers, improving their position as well, they would see what a tremendous impetus would be given to all those movements which had hitherto been attempted from the side of one or two particular societies. The four main objects of the Guild were these: the consideration of all questions concerning the relationship of the assistant to the principal, the institution of a system of unemployed insurance, to attempt the federation of all architectural societies, and to consider all practical and efficient measures for the protection of the profession. That seemed rather a large order. They knew that one society in particular had attempted something of that sort, but he thought where it had failed was that it had not sunk its own individuality as it should have done. It seemed to him that if an attempt was made by a society powerful in numbers and well represented by assistants, as assistants, to settle these questions of registration and education, and so forth, if they were represented on a federal council composed of representatives of all architectural bodies, the movement not being made on the part of any particular organisation, the organisation which endeavoured to engineer such a proceeding would sink its own individuality, and they would get a council which was truly representative of the entire profession without any stigma attaching to it in any way, and at the same time more capable of performing a useful and serious work than the present attempt could possibly be. Mr. Dixon then read letters of sympathy and criticism which he had received from the following gentlemen:—Mr. Barry Parker, Mr. E. A. Rickards, Mr. J. S. Gibson, Mr. Gould Wills, Mr. H. Clapham Lander, Mr. A. W. S. Cross (the chairman), Mr. Raymond Unwin, Mr. W. E. Riley, Mr. M. E. Macartney, Mr. R. S. Balfour, and the Architectural Association. Mr. Max Clarke wrote to the effect that he thought the proposed main objects of the Guild were rather outside the scope of such an association, which he thought should be confined to raising the position of the assistants, and generally assisting them in the sphere of their work.

Continuing, Mr. Dixon said he trusted the general objects of the Guild appealed to them all, and he thought, with a little advertisement and the necessary vigour, it should be an immense success.

Mr. A. J. PENTY moved the following resolution: "That the Guild of Architects' Assistants be formed, and that a provisional committee and officers be appointed to transact its business." He said that he was fully in sympathy with the idea of a Guild. There were a number of special things that they might deal with. If they could do something to stop the pupil system they would be doing a great deal. In proportion as architects had been getting hold of smaller work and the 5 per cent. had not been remunerative, they had had a system of men taking in pupils, and he thought that very probably many of their difficulties of the present day were due to that system. They could not deal with the question in the way of strikes, but if they could do something in the way of informing the public that architecture was not the soft job that they had thought it was, parents would not be so anxious to bring their sons up to the profession as in the past. He thought this Guild, in so far as it was a trade union, would do a great deal towards that. Personally, he would much rather the Guild were called a trade union frankly, because it would do more to break down prejudices against the profession than anything he knew of. It would, at any rate, break down the prejudice of the public bodies, where labour representation was getting a hold everywhere.

Mr. J. V. HIBBERT, F.S.I., in seconding the resolution, said that if they were successful in carrying out even a small portion of the results outlined, they would have every reason to congratulate themselves.

Mr. GOULD WILLS said he was the Secretary of the Architects' Technical Bureau. They were not a bureau in the sense of a labour bureau, but he had come in contact with a good many young men who had come to the bureau thinking it was in some way a means of getting in touch with an architect. When he heard of this Guild, it struck him whether in some way or other his bureau could be associated or federated with the movement, so that they might be of some service mutually. Anything that arose out of this meeting had got to have a financial backbone, and as his bureau was established and now pretty strong, it occurred to him whether it would be possible to think out a united scheme. They had been so busy at the bureau, however, that this question had not received much consideration at present, but there might be a possibility in it, and it might be worth while thinking about.

A gentleman asked if there was any restriction on candidates for membership of the National Union of Clerks, because, he said, it seemed to him that if they restricted the Guild to the better-paid and better-class assistants, they would be helping those who really did not want help. It was the "bottom dog" they wanted to help.

Mr. DIXON replied that in his scheme he had arranged for double the percentage, and, more than that, the unemployment scheme was based on the principle that if unemployment increased to such an extent that the minimum financial backing per member became decreased, a levy was to be made over the entire membership, and the amount of the levy would vary with the class to which a member was allocated. It would be seen, from the figure of 2 per cent. of unemployment in the National Union of Clerks, that very careful management must have been necessary. The Union had been in existence for 17 years, and yet their membership was only about 1,500, so that it could be seen easily that the unemployed coefficient being down to 2 per cent. showed what amount of care must have been taken in selecting members.

Mr. PENTY said he thought it was unusual for the better class assistants to be always in work. He thought it was the other way about. There were very few principals who could afford to pay a first-class assistant, and the consequence was that he remained out of a job, and the second-class man got the work.

Mr. DIXON, referring to Mr. Max Clarke's letter, said that if they wished to consider the question of the relationship of the assistant to the principal, they must necessarily consider the general circumstances under which the practice of the profession was carried on, and consequently all measures of restriction in the introduction of pupils. The idea of federating all the architectural societies was simply as a means of obtaining an impartial general council of the entire profession to carry out the objects of the Guild.

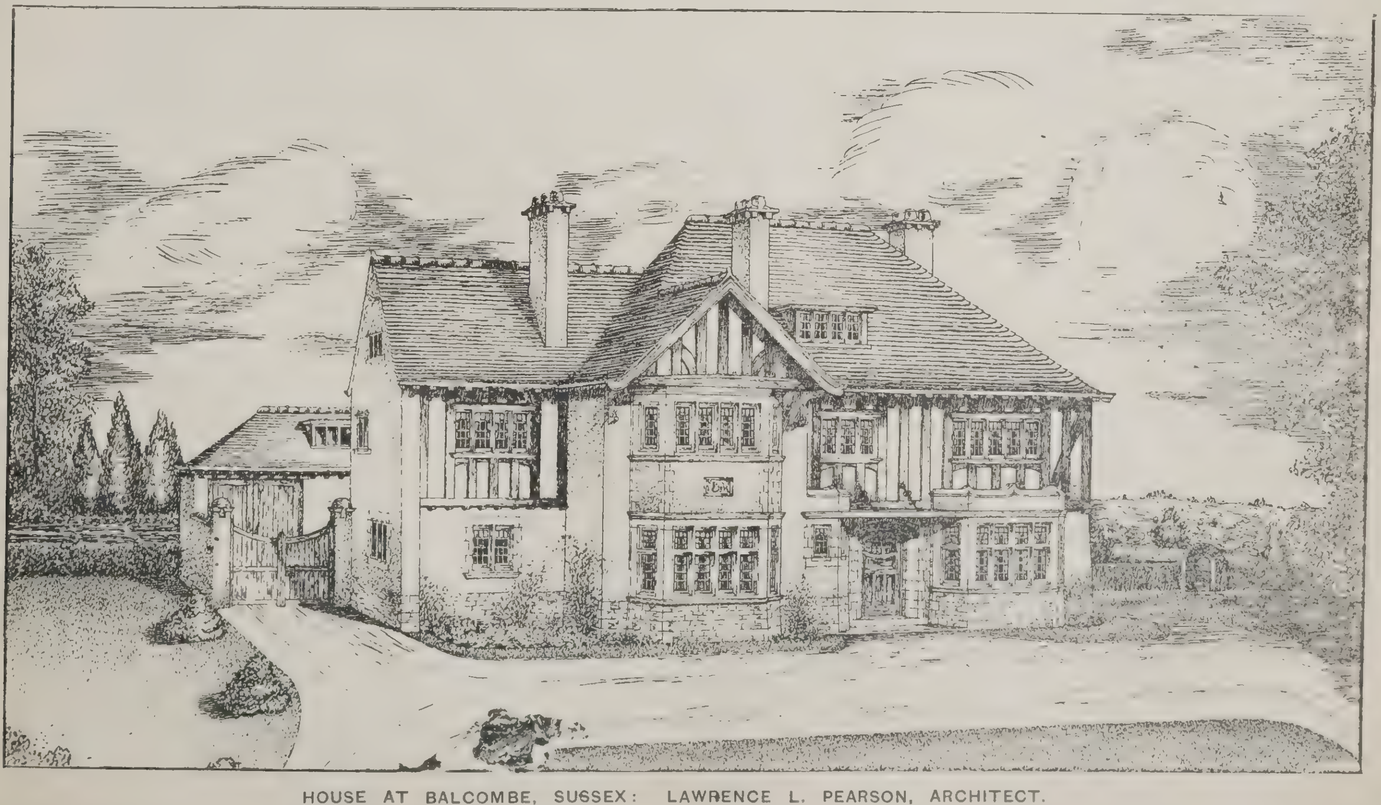
Mr. MAX CLARKE, called upon by the Chairman to address the meeting in amplification of his letter, said he had had the misfortune to be an assistant for 25 years. He thought that the youth of any generation wanted a certain amount of restriction put upon them, and his sole object in writing that letter was that, in forming this Guild, they should not upset anything or any set of people at present in existence. They all hoped to be principals some day, and the moment one became a principal he said to himself: "I am the person who is going to settle the relationship of my assistants to myself." He took it that if this matter was based on the consideration of all questions dealing with professional education, it would be perfectly in order, but when it came to the settlement of all questions between the principal and the assistant, he thought they were going rather out of their province. They were constituting themselves arbitrators, and naturally the principal would say he did not want an arbitrator between his assistant and himself. The provision of unemployment insurance was much to be commended; but the item to federate all the existing architectural societies was too large an order for a guild like this to dream of, because the various societies were more or less diametrically opposed to each other, and to hope for any federation was quite beyond the bounds of probability. With regard to the suggested object of considering all questions relating to the proper protection of the profession, if they had registration he thought something might be done in that direction, but without registration the question was as much in the air as that of federation. He was afraid the basis on which the unemployed fund was going to be worked was rather low; and he thought that the proposed limitation of the different branches of the Guild to 200 members was rather small for London, although he thought it would do very well in the country. As to the suggested federation with another bureau, if this Guild came into existence he recommended it to be entirely on its own bottom, and not to ally itself with any other society. People who leaned upon other people were of no use in the world.

Mr. PENTY said that one or two people to whom he had spoken had said that they had too much respect for themselves to join anything on a trade-union basis; and there was a strong feeling, he believed, that a "gentleman" did not do anything which the working classes did. It was that attitude of mind against which he protested; it was the "classy" feeling that did such a great deal of harm.

Mr. ELDER-DUNCAN said that, with regard to calling this society a trade union, he would remind them that there were such things as guilds in past ages, and as far as they could trace their history they combined the functions of an artistic profession and a trade union very successfully. Therefore, he thought that if they continued to adopt the word "Guild," they might in the same way combine an artistic profession such as architecture and a trade union very successfully. Mr. Dixon laid stress on the practical side of the architectural profession. It was a fact that the people who had the money, which they wanted for designing their buildings, had a great objection to the words "trade union"; one could not get away from that. It might be a wrong feeling, but the fact was that these people had that objection, and why they should stir it up unnecessarily by calling themselves a trade union he did not see. He thought for that reason also they should keep to the word "Guild." In conclusion, he said he had no doubt many of the points raised by Mr. Max Clarke were points to which the provisional committee when formed would devote itself first of all.

Mr. DIXON said that, with regard to the consideration of questions concerning the relationship of the assistant to the principal, he quite appreciated Mr. Max Clarke's objection. It was impossible, of course, to get a settlement unless the Guild was so effective as to include principals and assistants. As to the insurance question, this system was not an invention of his own, but it had been in existence in England for thirty or forty years, and from the financial status of the trades unions at the present time it had worked in a very flourishing manner. With regard to the federation of all the architectural societies, his idea was to get a sort of general council, at which all questions concerning the assistance of the profession generally could be discussed and solutions arrived at. Of course, it was in the air at present, but the great majority of the members of all these associations were assistants, and if they could make a direct appeal to the assistants in the United Kingdom, they would obtain a backing of membership of votes on all societies. He certainly proposed to stand on their own feet, and he did not propose to amalgamate in the way that had been suggested. He only wished to federate for certain definite objects, but he did not mean a general amalgamation of all architectural societies. As to measures for the protection of the profession, that was merely a crude way of referring to the question of registration to prevent continued influx into an already overcrowded profession.

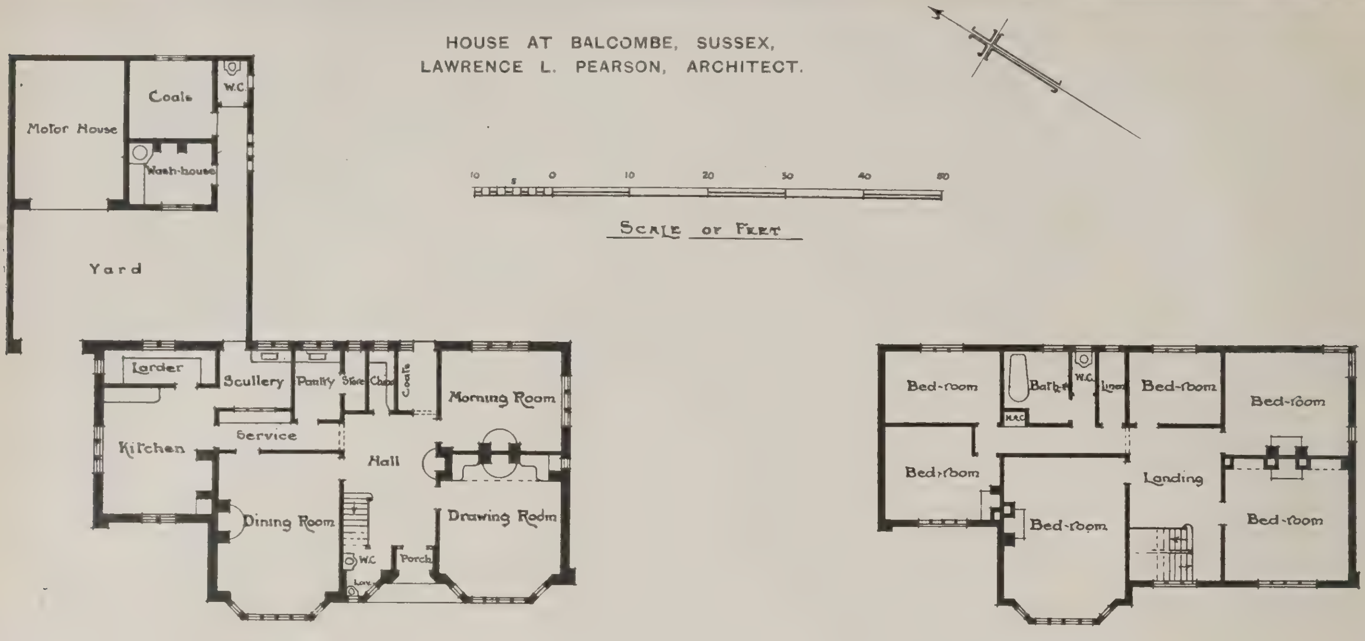
The CHAIRMAN said that a provisional committee would be formed, which would,



HOUSE AT BALCOMBE, SUSSEX: LAWRENCE L. PEARSON, ARCHITECT.

This house is to be built of brick, faced with white roughcast, with plinth of local rubble stone and the roof covered with dark red sand-faced tiles. The half-timber work is to be in oak, and the stone dressings to windows and front entrance are to be of Ancaster stone. Casements of wrought iron and windows glazed with lead lights.

HOUSE AT BALCOMBE, SUSSEX.
LAWRENCE L. PEARSON, ARCHITECT.



GROUND FLOOR PLAN

FIRST FLOOR PLAN

in view of Mr. Max Clarke's criticisms, go carefully into the questions as to the scope and objects of the Guild, and report again to a general meeting.

Mr. Penty's resolution was then put, and carried *nem. con.*, and the following gentlemen were appointed on the provisional committee, with power to add to their number, viz., Messrs. A. J. Penty, H. C. Lander, A.R.I.B.A., Barry Parker, W. Fullerton, J. H. B. Scott, Monro Wilson, H. C. Bishop, A.R.I.B.A., J. V. Hibbert, F.S.I., D. Milne, A.R.I.B.A., and E. J. Dixon (secretary *pro tem.*).

Mr. PINDAR asked if these gentlemen were all assistants.

Mr. DIXON replied that about three of them were practising architects.

Some discussion ensued as to the raising of finances for the preliminary operations in connection with the Guild's formation, and eventually the question was solved by those present contributing half-a-crown each as a subscription.

The matter having been settled, Mr. DIXON proposed a very hearty vote of thanks to Mr. Cross for his kindness in presiding over the meeting, and this was carried with acclamation.

In acknowledging the compliment, the CHAIRMAN said he believed and trusted that great good would result from the formation of the Guild.

A Town Advancement Association has been formed at Richmond, Surrey, for the purpose of directing and stimulating a more active effort on the part of its citizens to supplement the great things nature has done for the place. Working side by side with the town council, it aims at influencing public opinion in favour of wider and more beautiful streets on garden city lines, of rebuilding schemes in order to bring about the erection of better-designed structures, and to make Richmond a town of architecturally beautiful homes. The new association also aims to develop the resources of the borough in regard to music, art, education, and amusement. The mayor, Alderman W. Thompson, is president of the association; Sir James Szlumper, Sir Thomas Skewes-Cox, and Mr. George Cave, K.C., M.P., vice-presidents; and other workers are Councillor McDougall, Mr. Arthur Snow, Mr. Ernest Pennington, and the heads of the principal business houses. The secretary is Mr. Capel Smith.

Correspondence.

Echo in Assembly Hall.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—"E. N. D.," in your issue of February 17th, complains that "a hall like that shown in the plate given in 'The Builders' Journal' of December 23rd, 1908, has been found to possess an inconvenient echo." "E. N. D.'s" hall must be unlike the hall referred to—that of the Institute of Engineers and Shipbuilders, Glasgow—as it is entirely satisfactory in its acoustics, both for speaking and music. The dimensions there are 72ft. by 40ft. floor space, with elliptic ceiling rising from 15ft. 6ins. at wall head to 25ft. at centre.

The "hangers with angular boxes attached" have nothing to do with the acoustics, though probably they are not harmful. They are, as you rightly infer, electric light fittings, for the design of which we are not responsible. They are the production of a special scientific committee of the Institute, who had this department under their charge; but whatever one may think of the æsthetic result, they certainly light the hall effectively.—We are, sir,

JOHN B. WILSON AND SON.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The question raised by E. N. D., of Derby, in your issue of Feb. 17th, anent echo in hall with curved ceiling, is an interesting one to the profession. It is possible that the trouble is caused by the use of an unduly hard plaster for the ceiling. Would he mind describing the plaster actually used? I have erected similar halls without experiencing this trouble, but have always been careful to adhere to ordinary lime plaster. The ascertainment of the cause of the trouble should point the way to the proper remedy.

W. ROLAND HOWELL.

The Stability of Walls.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I was much interested in the description given by Professor Adams of the corrugated boundary wall at Easton Park.

I know of a yet more daring example of an unbuttressed corrugated wall of this type. It is at Darvell Hall, in Sussex. In this case the wall encloses a fruit garden, rectangular in shape, 98ft. by 76ft. The double-bend between tangent points measures 19ft., with a rise, like that at Easton Park, of 2ft., and the height is 8ft. The thickness of the wall is just half that at Easton Park, or 4½in. only.

Darvell Hall, originally known as Darvell Bank, is near Robertsbridge, and parts of the house are fully 200 years old. The wall referred to is, of course, much more recent, but the fruit-trees trained along it may well be fifty years or more old, and the wall is practically as sound as the day it was built.

Professor Adams's differentiation between counterforts and buttresses is interesting, and quite new to me. I take it that the distinction is quite a modern one, as it seems in no way borne out by the derivations of the words.

GEORGE HORNBLOWER.

London, W.

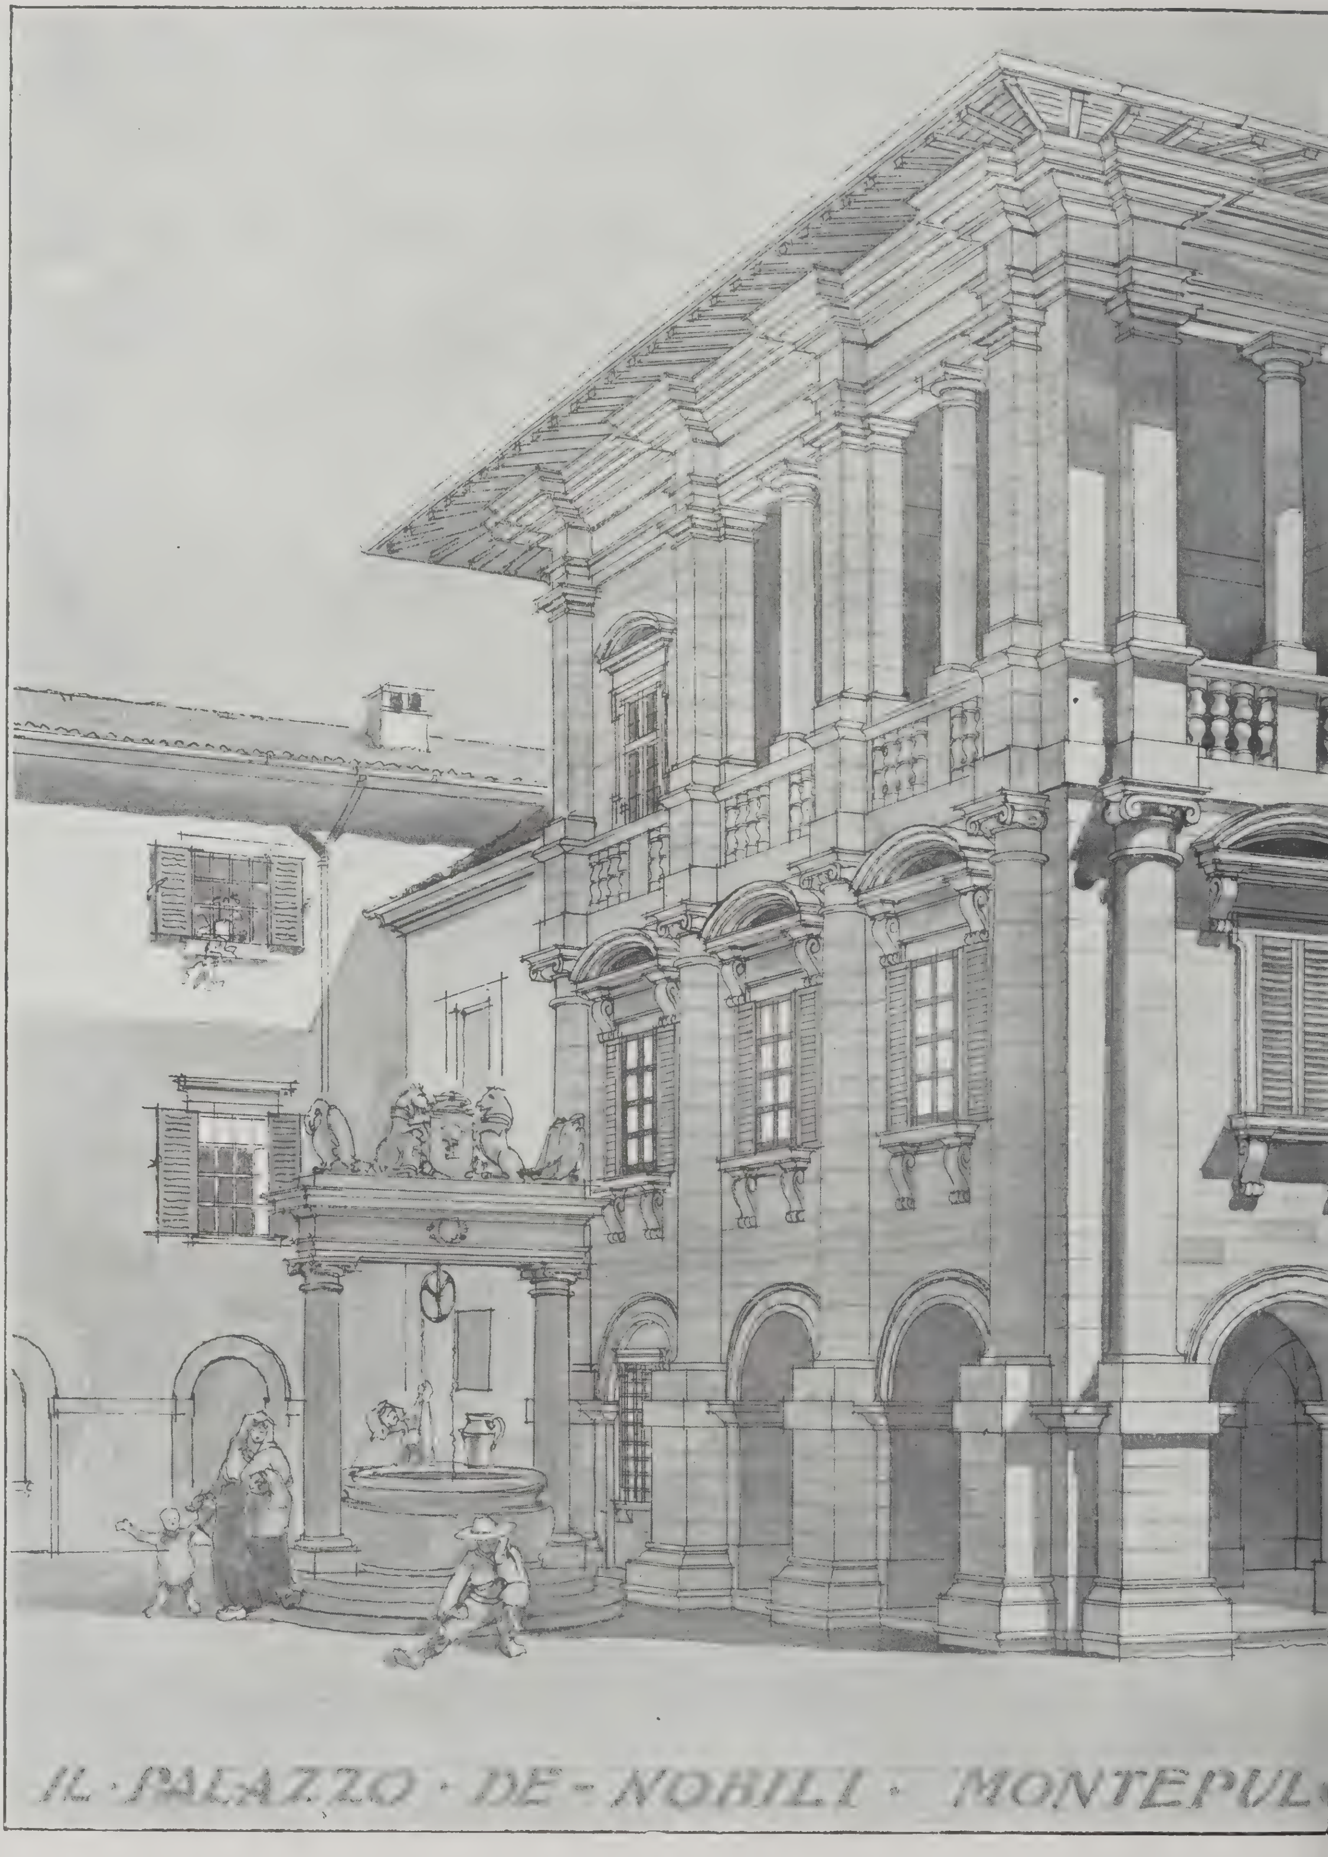
The scheme for new public baths at Preston, for which borrowing powers had been obtained, has been dropped.

* * *

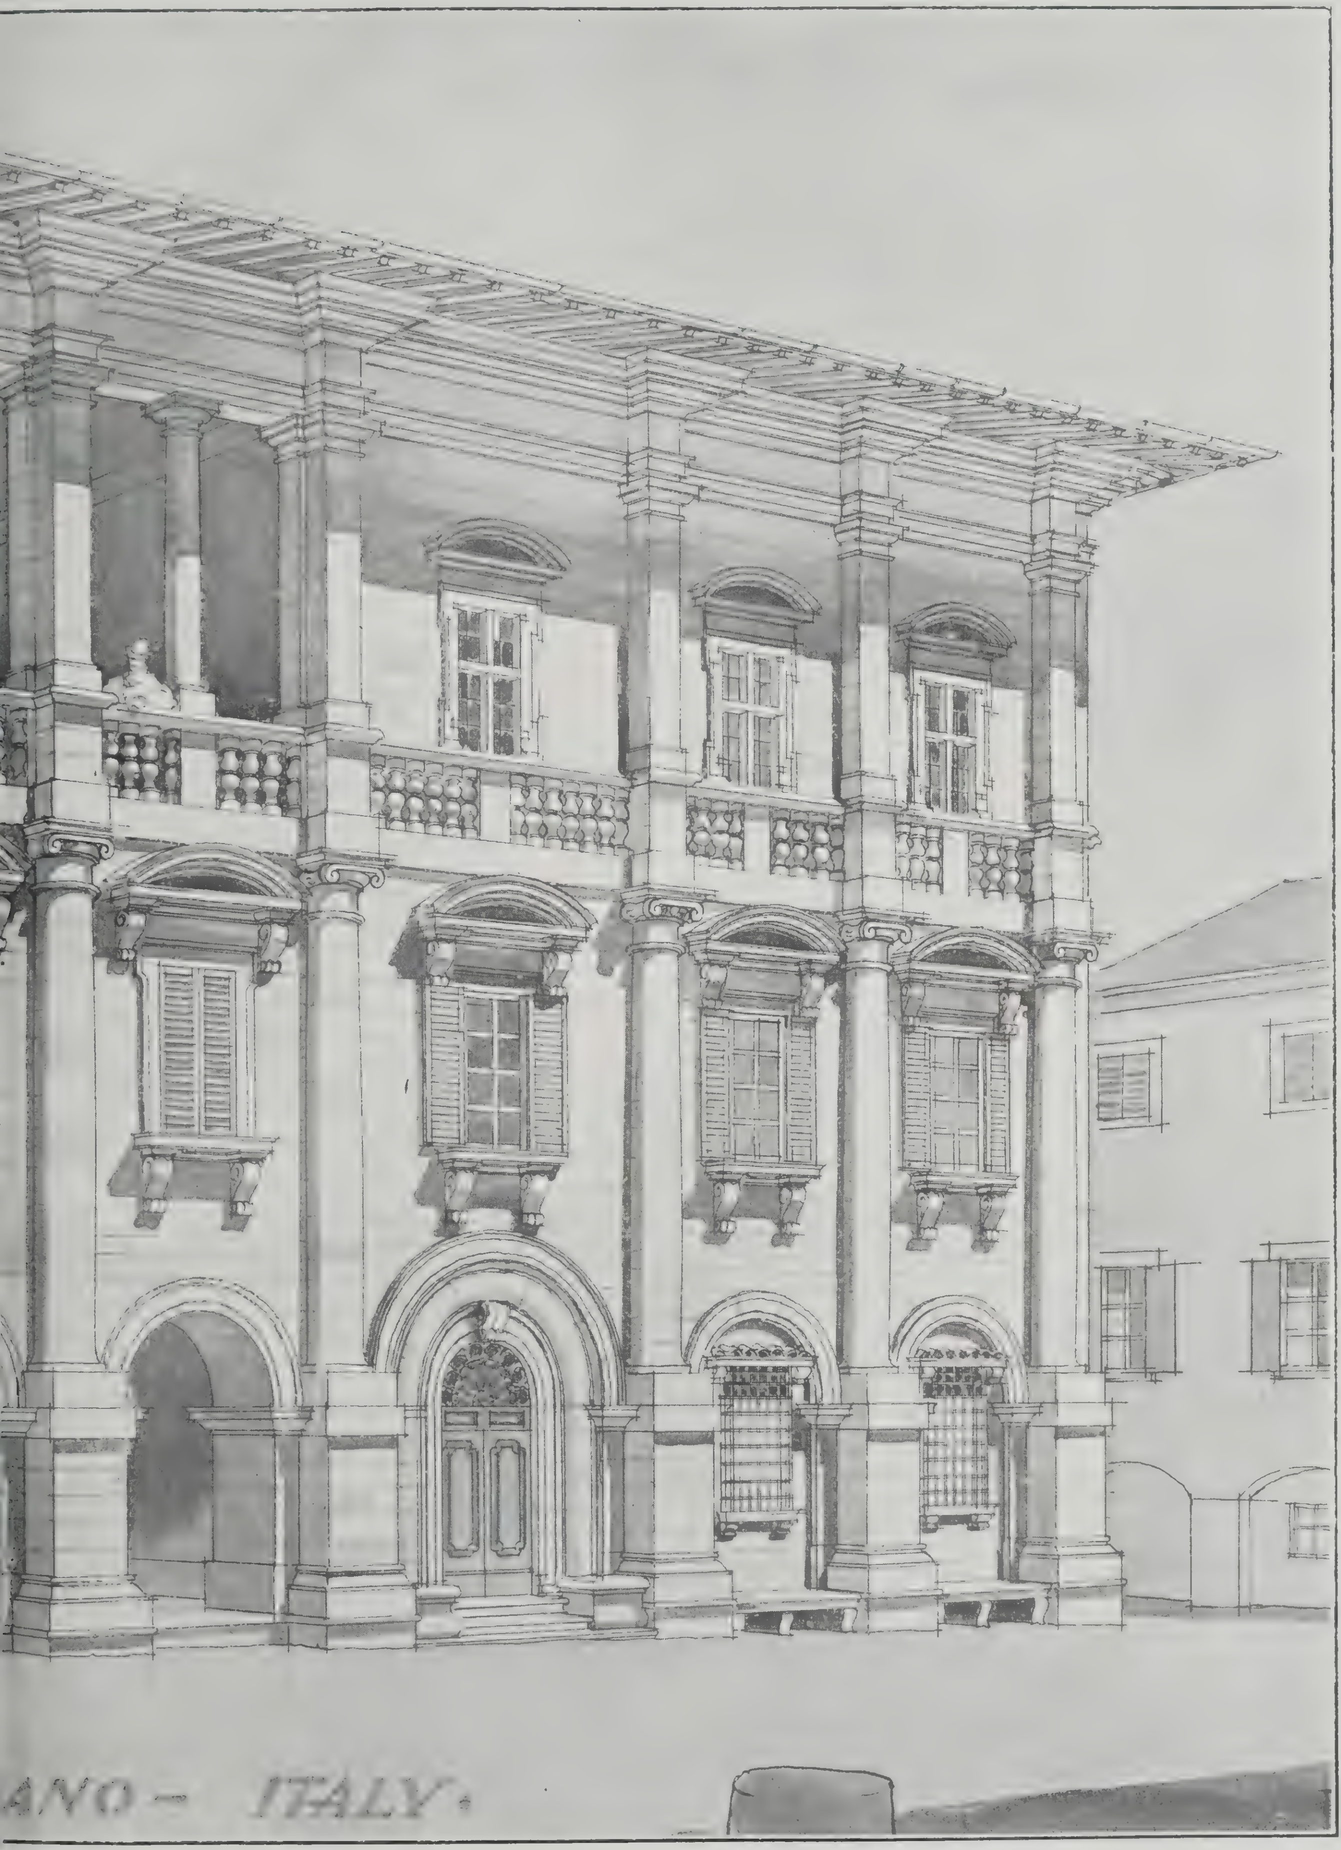
Mr. Percy Robinson (president of the Leeds and Yorkshire Architectural Society), in the course of a lecture delivered before the students of the School of Architecture at the Leeds Institute on "Some Modern Conditions of Architectural Design," emphasised the necessity of studying the great works of the past, pointing out that all art must be based upon what had gone before. At the same time he warned them of the danger of becoming mere archæologists, blinded by the glamour of historical associations; the mechanical reproduction of past styles would never produce a living architecture. Comparing the conditions under which architects work to-day and those which obtained in the early days of art, when the great masterpieces of architecture were produced, he pointed out the great difficulties and the many restrictions which the architect of to-day had to contend with, and the difficulty of reconciling many of these conditions with the artistic spirit. Dealing with some of the modern innovations, Mr. Robinson suggested that these would materially influence the architecture of the future. In conclusion, he recommended the students always to bear in mind the essentials and the highest ideals of their art, to tackle these modern problems, and to turn what might at first appear to be restriction into an advantage, to mould difficulties into success, and so triumph over imposed conditions.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Supplement to THE BUILDERS' JOURNAL AND ARCHITECTURAL ENGINEER. *Wednesday, March 10th, 1909.*



DRAWN BY LESLIE WILKINSON,



THUR CATES PRIZE, R.I.B.A. 1909.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Mar. 17	†NEW OFFICES FOR THE STANLEY U.D.C., DURHAM. Cost £3,500. Premiums £30, £20 and £10. Conditions, etc., to be obtained from J. G. Ridley, Clerk to the Council, Stanley S.O., Co. Durham.
Mar. 24.	HALL AT EASTLEIGH, HANTS, to be erected adjoining the Railway Institute for the L.S.W. Railway Co. Particulars and site plan from the Secretary, L.S.W.R., Waterloo Station, London, S.E. Deposit £1 1s. Designs to be sent in at 10 a.m. on date given,
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.
April 10.	BOLTON BRANCH PUBLIC LIBRARIES. The Libraries Committee of the Corporation invite competitive plans from architects who have been principals in the County Borough of Bolton six months prior to the present date for Branch Public Libraries to be erected in the districts of Astley Bridge, Halliwell, and Gt. Lever. The plans and particulars may be obtained from Samuel Parker, Town Clerk, Town Hall, Bolton. Deposit, two guineas.
April 12.	ELLAND NEW SECONDARY SCHOOL. Architects having offices and practising in the West Riding of Yorkshire are invited to compete for the work in connection with the new Secondary School at Elland, and should apply for particulars to Mr. Leonard Clegg, Holiwell Green, near Halifax.
July 31.	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	BOURNEMOUTH BRANCH PUBLIC LIBRARY. Architects practising in the County Borough of Bournemouth are invited to submit designs for a new Branch Library at Boscombe. Particulars from Charles Riddle, Borough Librarian, Central Library, Bournemouth

† The Royal Institute advises members not to compete.

The Stanley U.D. Council Offices.

At the business meeting of the Royal Institute of British Architects on Monday, March 1st, Mr. K. Gammell (Associate) asked: "Whether, in view of the letter signed by Jos. Routledge on behalf of the Stanley Urban District Council, appearing in the BUILDERS' JOURNAL for 10th February, any steps have been taken by the Council (other than by publication of the notice in No. 7 of the Journal) to induce the members referred to, to observe the *esprit de corps* reasonably to be looked for from the members of this Institute, ; and, if not, whether steps will be taken to exercise a deterrent influence on members who enter competitions which are considered objectionable by the Council of this Institute."

In reply, Mr. Ernest George stated that the Council deeply regretted the circumstances referred to by Mr. Gammell. The question had frequently been discussed by the Council, and it was thought that they ought to be able to trust to the right feeling of members. The Council, he understood, were not at liberty to put coercion on members. Mr. Leonard Stokes added that the question was being considered by the By-laws Committee.

West Riding School Competitions.

At a meeting of the Council of the Leeds and Yorkshire Architectural Society held in Leeds on Thursday the question of architectural competitions for secondary schools in the West Riding was considered. The secretary was instructed to write to the West Riding County Council and also to the Governors of the Brighouse Secondary School pointing out that the plans selected in the recent competition for the Brighouse Secondary School did not comply with the conditions laid down, inasmuch as the accommodation provided was inadequate. With regard to the proposed Elland and District Secondary School it was resolved to point out to the County Council and the Governors of the school that the remuneration to be given to competing architects was inadequate, and to ask them to offer the usual terms.

Pearl Life Assurance Buildings, Leeds.

The directors of the Pearl Life Assurance Society, acting upon the advice of their consulting architect, Mr. Percy Monckton, F.R.I.B.A., F.S.I., have accepted the design of Mr. William Bakewell, F.R.I.B.A., of Park Square, Leeds, in the competition for their new premises in Leeds.

Footbridge over the River Wey, Guildford.

The result of this competition has been announced as follows:—First, Messrs. Clemence and Moon, architects, Guildford; second, Messrs. Davies and Swayne, civil engineers, Westminster. The design of Mr. W. E. Lloyd, surveyor, Guildford, was specially commended. 75 designs were received.

Elland Mixed Secondary School.

We have received copies of the conditions and amended conditions for the above. Clause 2 has now been amended to read as follows: "A fully qualified non-competing architect, in conjunction with the West Riding Education Committee's Inspector of Secondary Schools, will assist the governors in adjudicating upon the plans, whose decision, subject to confirmation by the West Riding Education Authority, is to be final." Clause 14 now reads: "The total amount which the governors are prepared to expend on the buildings as above described is £7,000, which includes all the items previously specified, including all professional charges." We have also received a copy of 60 supplementary questions and answers. Question 60 relates to clause 19 of the conditions. The architect employed will now receive 6 per cent. to cover the supply of quantities instead of the 5 per cent. originally stated.

Our Plate.

The Palazzo Nobile at Montipulciano stands in the Piazza Vittorio Emanuele, the chief square of the town, and was designed by Ant. da Sangallo the Elder. In the same square are situated the Cathedral, the 14th century Town Hall, and several large mansions. The open loggias at the corner on the ground and second floors overlook the square. The upper loggia is at present built up and has commonplace windows inserted. The Palace is built of a warm brown stone, and is roofed with the usual red furrow tiles. The drawing, by Leslie Wilkinson, is one of those which secured for the artist the Arthur Cates prize at the R.I.B.A. this year.

BRASS GATES FOR THE MAHARAJAH OF MYSORE.

The illustration on page 201 shows a view of a pair of massive brass gates, made entirely by British labour, in the Birmingham Works of Tonks, Ltd., and destined for the mausoleum of the late Maharajah of Mysore. The gates are 13ft 6in. high and 13ft. 6in. wide, across both gates, and weigh three tons. The frame is solid drawn and polished, and the casting is all brass, hand faced and lacquered, with dead finish and relieved. The design was based on a rough suggestion of the present Maharajah, and the appearance is practically the same on both sides, the répousé panels representing elephants in the jungle. The time occupied in making the gates was eight months. They will be erected between columns of white marble, and will not be subjected to the stress of weather, though the climate of Mysore is by no means terrible. This illustration of British brass-working will be welcome to those who imagine that the industry has died out here.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Local Authority's Rejection of Plans.

PROVINCIAL.—An Architect and Surveyor writes: "I enclose plan of a house [not reproduced], also copy of by-laws, with respect to both of which I should be thankful if you would answer the following questions:—(1) The council will not approve the plan unless the old wall is taken down and set back. Can they demand this? (2) Two resolutions that the council have recently passed are as follows: First, that no disapproved plan will be returned by post: the architect must call at the council offices for it. Secondly, that the council surveyor is not to give any particulars whatever of the reason for disapproving the plan. Can the architect demand to know reasons for rejection? (3) What is the remedy against arbitrary rejection?"

(1) The rural district council cannot compel you to set back the existing wall: they must accept matters as they find them, and confine their attention to the proposed new building. Are you sure that this is the only reason why your plans are disapproved? (2) The council are within their powers in passing the two resolutions you quote, though one may have one's own opinion as to their wisdom in doing so. (3) If you commence building before your plans are approved, you do it at your own risk, and are liable to be prosecuted and penalised in accordance with the by-laws (page 51, etc.), of which you send a copy. Proceedings are usually taken before the local bench of magistrates. Should you be aggrieved by the refusal of a sanitary authority to pass plans, your legal remedy is to obtain a *mandamus* from the High Court to compel them to show cause for the refusal. Whether such action is to be recommended depends upon circumstances, but it does not appear to me to be a question whether in this case it would not be better and cheaper to move the wall as required by the R.D.C.

F.S.I.

Workmen's Compensation.

ECCLES.—J. F. M. writes: "In addition to my own men, I have the workmen of my numerous sub-contractors insured against claims for compensation. This is unsatisfactory, as, in the event of an accident to one of the latter, the insurance company would probably require a return of the wages paid by all the sub-contractors to their workmen employed on my jobs. This, I can see, would be almost impossible. I purpose in future not to insure sub-contractors' workmen, but, before accepting the estimate of any sub-contractor, to require him to give me an indemnity against any claim that might be made by his men (in the event of an accident). I may say that one or two sub-contractors have voluntarily informed me that their workmen are insured. Should I be quite covered by adopting the above course, and if so in what form would you advise me to word the indemnity?"

The Workmen's Compensation Act, 1906, makes the principal contractor liable for accidents to a sub-contractor's workmen; but also provides (section 4, sub-section 2), that the principal may arrange for an indemnity to be given to him by the sub-contractor. I advise you, therefore: (1) To employ no sub-contractor who is not in a sufficiently sound financial position to protect you against any claims by his workmen; (2) To insert an indemnity clause in every sub-contract protecting you against any claim by that sub-contractor's men, whether arising under the Workmen's Compensation Acts, or at Common Law. F.S.I.

Right of Light.

Bloxwich.—B. C. writes: "My intention is to build two cottages, as shown on the accompanying rough plan [not reproduced]. Please say whether there would be any danger of infringing rights of light."

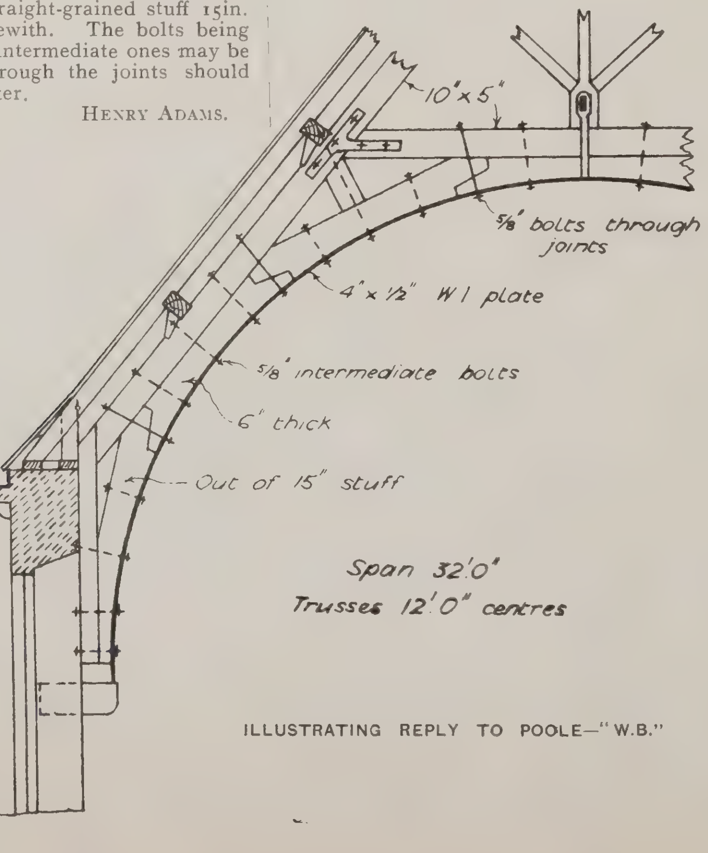
You would undoubtedly run a grave risk in building the cottages in the manner proposed, as you would certainly take away a great deal of light from your neighbour's cottage windows, and so render yourself liable to be restrained by an injunction, and possibly have damages and costs to pay, and perhaps be ordered to demolish the new cottages. Cannot you set your new houses back sufficiently far to clear the ancient lights in the neighbouring property? F.S.I.

Width of Timber for Curved Braces.

Poole.—W. B. writes: "Please say how the rib is found in the roof shown in Fig. 1, p. 78, of your issue for January 27th."

The timber for the curved braces to collar-beam truss shown at p. 78 would be compass oak, or steamed and bent fir, not less than 16in. wide. An alternative method to permit of cutting out of straight-grained stuff 15in. wide is shown herewith. The bolts being closer together, the intermediate ones may be ⅝in., but those through the joints should remain ¾in. diameter.

Henry Adams.



ILLUSTRATING REPLY TO POOLE—"W.B."

Design for Braced Collar-beam Roof.

Lytham.—J. W. T. writes: "Will Mr. Henry Adams kindly explain (*re* reply to 'Dublin—L.,' design for braced collar beam roof, in issue for January 27th) where he gets the 30 in calculating neutral axis from bottom of plate:—

$$\frac{(52{\cdot}5\times15{\cdot}5)+(52{\cdot}5\times5{\cdot}5)+(30\times1{\cdot}625\times{\cdot}25)}{52{\cdot}5+52{\cdot}5+(30\times1{\cdot}625)}$$

Also, why he deducts this distance, viz., 7·3 from the depth of beam and plate, and × the remainder by 2. Also what is the limit of safety to allow in cwts in compression and tension in principal rafters, etc., as calculated by the formula $\frac{W}{A}\pm\frac{M.}{Z}$

In calculating the distance of neutral axis from bottom of plate, the area of wrought iron plate is multiplied by 30, to give the relative value in timber. The timber alone on one side of the neutral axis, and the timber and wrought iron on the other side then have the same value with reference to the neutral axis. Therefore, in order to get a scantling of timber only with the same strength, the distance from neutral axis to upper edge of timber must be doubled. The doubled dimension being taken as depth of beam, the extreme fibre stress is obtained by the ordinary formula $\frac{W}{A}+\frac{M}{Z}$. Timber varies so extremely in strength that it is difficult to lay down general rules, but a stress of 10 cwt. per square inch gives a factor of safety of 3 on the weakest fir timber, and 12 on the strongest, both for tension and compression. Under ordinary conditions of use, the maximum working stresses on timber in roof trusses may be taken as 6 cwt. compression and 3 cwt. tension per square inch, but double this may be allowable with best workmanship and material. The allowance for tension is only given as half that for compression, owing to the general failure to connect timber in such a way as to call forth its full power.

Henry Adams.

Cause of Floor Decaying.

Scotland.—Rutherglen writes: "In December, 1907, I built a house. It was deafened in the manner usual here—viz., a coat of lime on the boards, and afterwards, before the flooring was laid, a coat of asbestos was laid on top, leaving a space below the floor of at least 2½ins. The house was occupied in May, and the tenant now complains that where he has laid floorcloth the floor is destroyed by damp, and, in fact, the underside was wet. Where carpet was laid on the floor, however, there is no sign of damp. Can you indicate the cause of this?"

The fault in this case lies with the use of an impervious floorcloth upon a wooden floor. Being absolutely impervious to air, it confines any moisture there may be under such circumstances, and a very slight amount will rot woodwork. F.S.I.

Fall Required in Pipe.

Padiham.—W. H. writes: "Please state the fall required for a 12-in. stoneware pipe to supply 1,000 gallons per minute; also size of a draw-well to avoid friction. Is ——'s cement considered good?"

The head in feet required to deliver 1,000 gallons per minute in a stoneware pipe, 12in. diameter and 100 yards long, will be found as follows:—Head to produce velocity $\frac{G^2}{215d^4}=\frac{1000^2}{215\times12^4}=0.224$ ft. Head to overcome friction $=\frac{G^2L}{240d^5}=\frac{1000^2\times100}{240\times12^5}=1{\cdot}675$ ft. or together $0.224+1.675=1.899$, say 2ft. fall required in the pipe. If the pipe be increased to 15in. diameter, the necessary fall will be reduced to 0.64ft., say, 8in.; and if the pipe be reduced to 9in. diameter, the fall must be increased to 7.76ft., say, 7ft. 9in. The entrance to the pipes should be bell-mouthed. The writer does not understand what is meant by "size of draw-well to avoid friction," nor can he give any opinion on any particular brand of cement.

Henry Adams.

Pressure in Water Main.

Chatteris.—S. H. writes: "Supposing water is delivered in bulk at point A, and the agreement is that at that place the pressure to be given is equal to 50ft.-head, or about 22lbs. per sq. inch. The main up to A is 8-inch, and from that point 7-inch for several miles. What amount of pressure do you suppose would be lost by friction, etc., on a length of 7-in. main, 4 miles long, that is, what less pressure in lbs., also in feet-head, should we get at a point 4 miles from A on 7in. main? The ground is all fairly level."

The question omits to state what quantity of water is required to pass through the 7-in. main in a given time. When no water is passing, no head would be lost by friction, and the full pressure of 50ft.-head at A would be obtained at B, except for the difference in level of the two points, which would add 11.4—8.3 = 3.1ft.-head to the 50ft. Assume the water to be flowing at 3ft. per second, this will be equal to $\frac{72\times60}{10}=$ 294 gallons per minute. Then the head, to produce velocity, will be $\frac{G^2}{215d^4}=\frac{294^2}{215\times7^4}=$ 0.167ft., and the head to overcome friction will be $\frac{G^2L\text{ yds.}}{240d^5}=\frac{294^2\times4\times1760}{240\times75}=150{\cdot}857$ ft., or a total head of $0.167+150.857=151.024$ft., but there is only 53.1ft.; therefore the possible discharge is $294\times\sqrt{\frac{53.1}{151.024}}$ whence

$$\log h=\log 294+\frac{\log 53.1-\log 151.024}{2}=$$

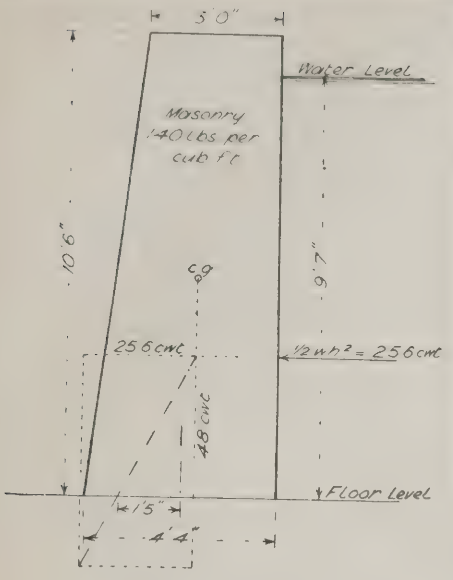
$$2.4683473+\frac{1.7250945-2.1790356}{2}=$$

$2.4683473+\bar{1}.7730294=2.2414$, for which the antilogarithm gives 174.35, say 175 gallons per minute.

Henry Adams.

Reservoir Wall.

Midlands.—W. L. writes: "Please explain how the calculation for the section of reservoir wall shown in the accompanying sketch should be ascertained."



ILLUSTRATING FIRST REPLY TO MIDLANDS.—"W.L."

The stone of which the wall is built is not named, so that the weight cannot be estimated. It may, however, be assumed to be 140lbs. per cubic foot. Upon that assumption the line of thrust will be as shown in section herewith, and the maximum stresses at base of wall will be $\frac{W}{A} \pm \frac{M}{Z} = \frac{48}{4\frac{1}{3}} \pm \frac{48 \times 1\frac{5}{12}}{\frac{1}{6}(1 \times 4\frac{1}{3}^2)}$ $= 11 \pm 22 = 33$ cwt. or 1.65 tons per sq. ft. compression, and 11 cwt. or 0.55 ton per sq. ft. tension, which ought to be quite safe even for lime mortar. Care will have to be taken with the cement rendering to ensure good adhesion without cracking.

Henry Adams.

Reservoir Wall.

Midlands.—W. L. writes: "Further sections of the reservoir wall referred to in a former communication are sent herewith. Please advise as to its strength."

The correspondent's second letter in reference to this case shows that the conditions are greatly different from the simple inquiry he first made, which has already been answered, as the thrusts from the arched roof and earth filling have to be taken into account. In order to work out the stability of the wall, the primary thrusts from the arch and load above must first be found by parallelogram of forces as shown in the accompanying illustration. Continue the thrust at skewback with the weight of wall and earth above it, and then combine the resultant so found with the thrust from the earth filling. This second resultant is then combined with the water pressure, giving the final resultant, which cuts the ground at 3.16ft. from the centre of base of wall. The stresses will then be $\frac{W}{A} \pm \frac{M}{Z} = \frac{74}{4\frac{1}{3}} \pm \frac{74 \times 3.16}{\frac{1}{6}(1 \times 4\frac{1}{3}^2)} =$ $17 \pm 75 = 92$ cwt. or 4.6 tons per sq. ft. compression, and 58 cwt. or 2.9 tons per sq. ft. tension, so that the wall would probably fail, unless the tie-bolts, of which insufficient particulars are given, are sufficient to secure stability.

Henry Adams.

Reservoir Wall.

Midlands.—W. L. writes: "With reference to my second inquiry on this subject, will you kindly state whose formulæ were adopted in the reply?"

I have adopted my own formulæ, and methods based upon Rankine. It is clearly shown on the diagram that the opposing weight of the soil has been taken into account. In the formula $\frac{W}{A} \pm \frac{M}{Z}$, W = vertical component of resultant in cwts., A = area of base for 1ft. run in square feet, M = bending moment due to eccentricity of resultant in cwt.—feet, Z = section modulus $= \frac{1}{6}\ b\ d^2$, where b is 1ft. run and d is width of base in feet. The sign $\pm$ means that there are two answers obtainable, using the plus gives the compression in cwts. per sq. ft. on outer edge, and using the minus gives the compression, or tension, as case may be, on the inner edge.

Henry Adams.

Building Contracts.

Woburn.—X. M. writes: "General information with respect to building contracts would be serviceable. Is the value of the stamp governed by the amount of the contract?"

A building contract may be a very simply worded document, so long as it clearly shows what is intended, but it is nevertheless to be recommended that use should be made of one of the usually recognised forms of contract; the oldest is that issued by the Institute of Builders, and another, which probably is that most generally employed, is issued by the Royal Institute of British Architects. To ensure enforcement in the courts a contract to build should be in writing, but part performance may be accepted by a court as securing its enforcement. A contract should be signed by the party against whom it is intended to be enforced (i.e., the contractor), but it is desirable that it should be signed by both parties. A sixpenny agreement stamp (adhesive or impressed) is sufficient for any building contract: no "ad valorem" duty is chargeable.

F.S.I.

Procedure for Church Committee.

Waterford.—W. S. B. writes: "A small church is to be erected to seat from 200 to 300. The site has been secured, on which at present stand two dwelling houses (these become the property of the purchasers of site). The sum at disposal for building is estimated at about £2,000. (a) What would be the best course of procedure relative to procuring plans, etc.? (b) What should be a fair average cost per sitting? (c) If competitive plans are obtained, what is the proper course in regard to architect's fees? (d) What information is it necessary to lay before an architect in asking for plans?"

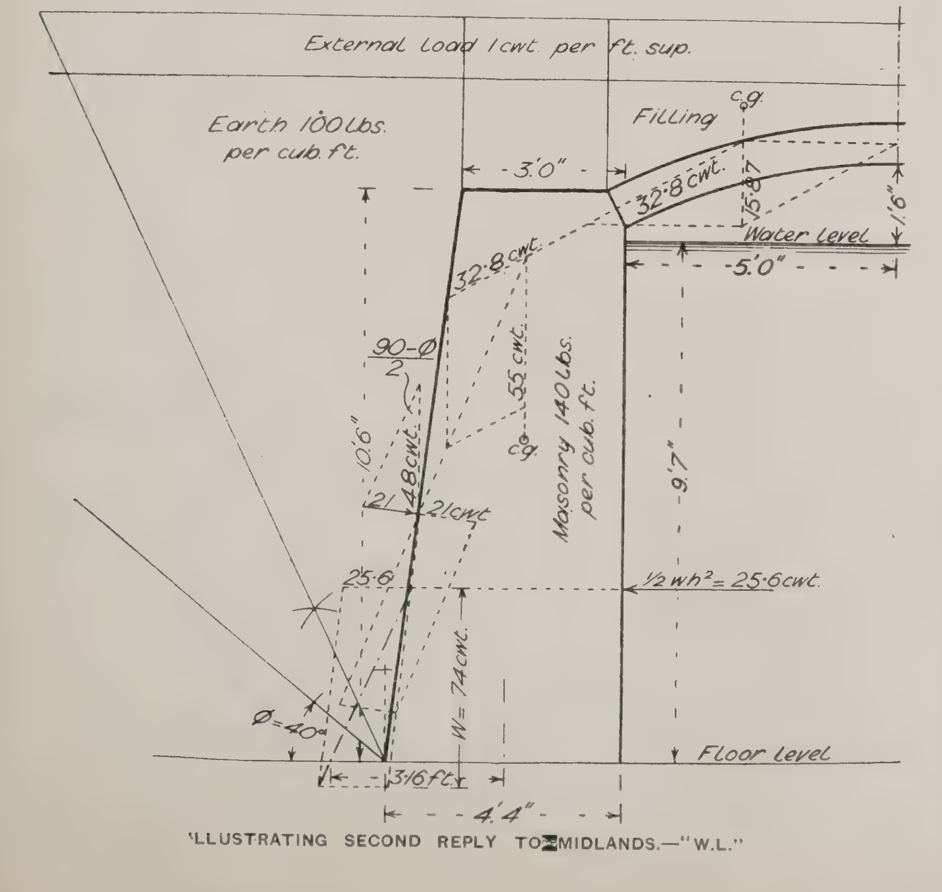
(a) The vicar, wardens, sidesmen, and any prominent church workers, should form themselves into a committee, termed "Building Committee," and should discuss and settle whether or not they will have a competition, or employ an architect. If they decide upon a competition, they should write to the Royal Institute of British Architects for advice, and ask them to nominate an assessor to draw up conditions, etc., and generally to advise. (b) Allowing for the sum of £2,000 (named as the limit at disposal), a single architect should, I think, be selected, as a competition would be expensive. The average per sitting is usually taken at £10. Very simple work, if labour is cheap, might be got for £9. These prices are inclusive. (c) The R.I.B.A. will send data for competitions, and should appoint an assessor, who will advise fully upon all matters. Address to Secretary, 9, Conduit Street, Regent Street, W. (d) If the committee select an architect, it will be necessary for them to meet him, when they can explain all particulars as to (1) site; (2) fees; (3) sum to be expended on the building and site, and accommodation they would like to obtain for each sum; (4) style they advocate; finally leaving him to advise on these matters and to give them the best solution he can devise.

Architect.

Points in Fire Insurance.

Cambridge.—Batnac writes: "I should be glad to know the usual custom as to fire insurance, and the best way to put an owner in a good position in the event of fire. For instance, in the following cases what should the amount be? (1) Substantially built brick and slate or tile farm premises, just completed at a cost of £900. (2) Do. do. pair of cottages at £450. (3) As 1 and 2, but built say, 20 years ago, when building was much cheaper. (4) Farm premises built with stud and weather boards on a brick dwarf wall, roofed with corrugated iron, costing £300. Presumably a good part of the walling would not be seriously damaged by a fire. Again, if one insured No. 3 for more than they cost, would one recover from an insurance company enough to reinstate at present prices? What about really old premises which serve their purpose but could not be reinstated for anything like what they appear to be worth at the moment?"

(1) The rate is 3s. per cent. on the total cost of the building. (2) The rate is 1s. 6d. per cent. on the total cost of the cottages. (3) The same rates as 1 and 2. (4) The rate is 3s. per cent. on the present estimated value. It is not possible to insure a building for more than the actual value of such building. It is always necessary to insure



ILLUSTRATING SECOND REPLY TO MIDLANDS.—"W.L."

a building for its full value at the time the insurance is taken out, otherwise, should a fire occur, a proportionate amount of the damage done can only be recovered from the insurance company.
R.T.

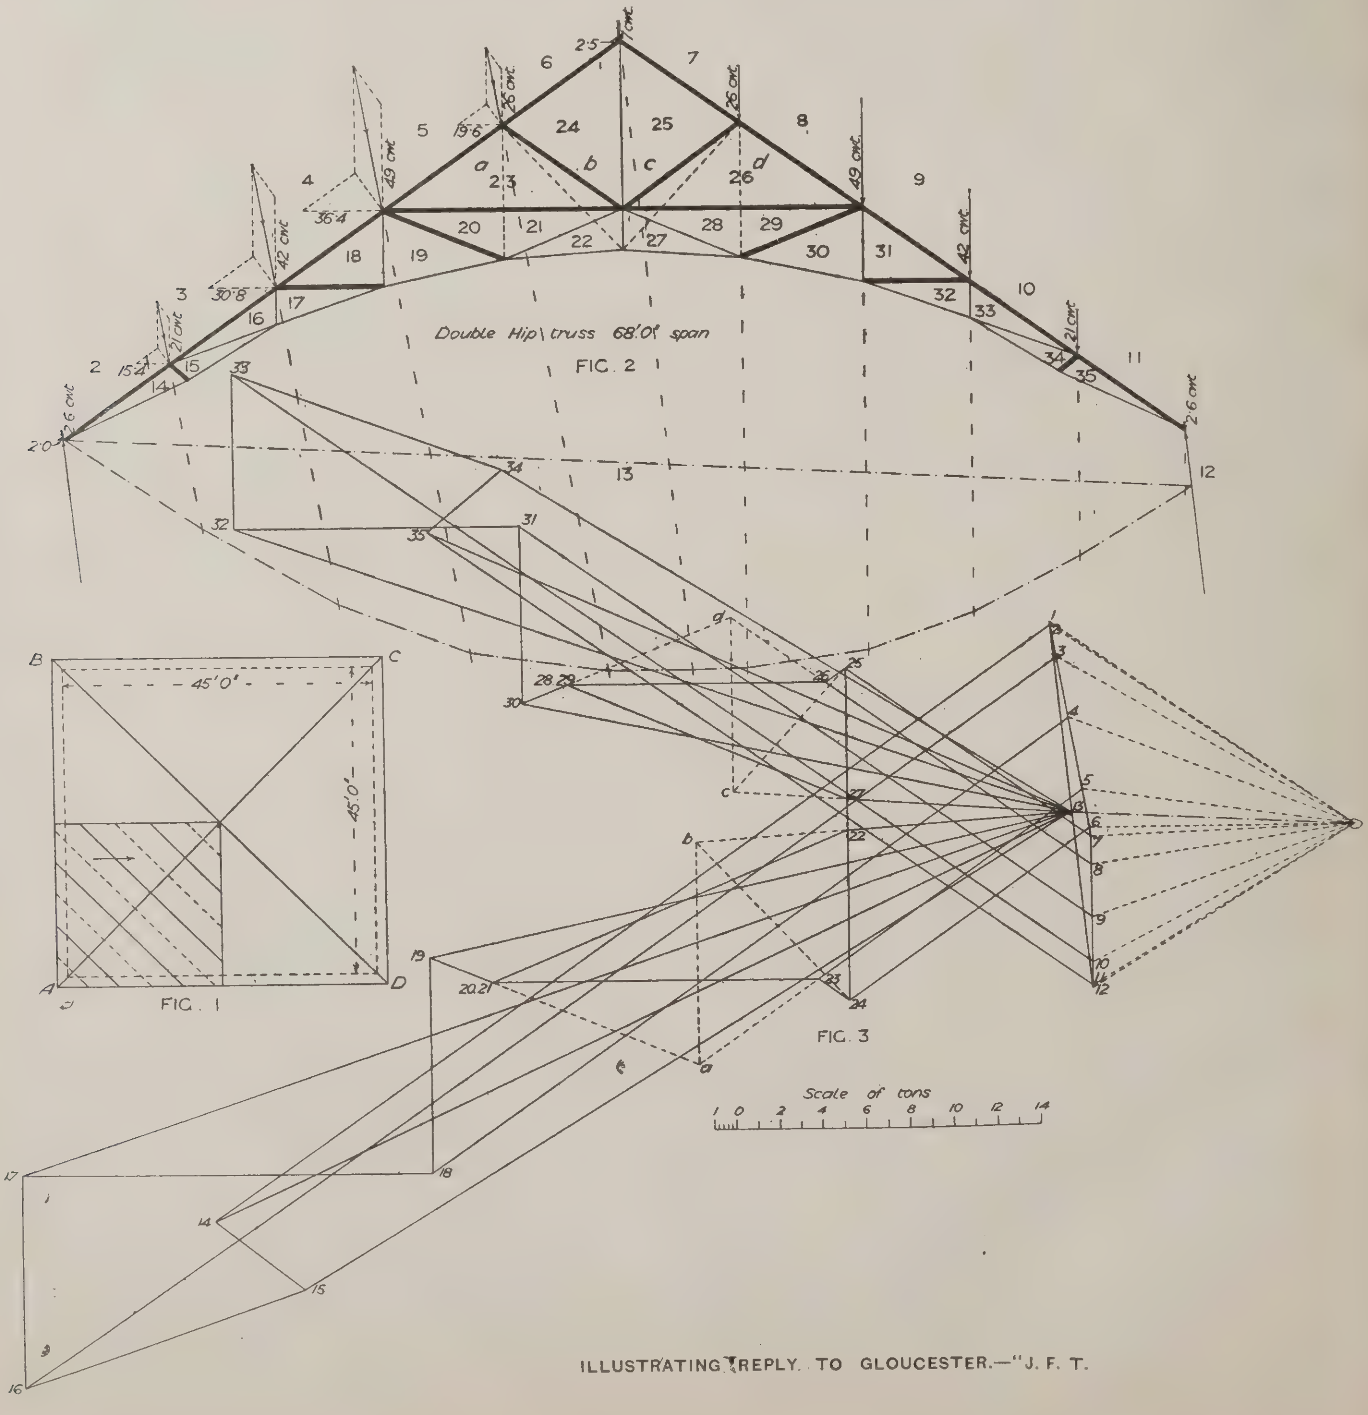
Diagonal Truss to Square Roof.

Gloucester.—J. F. T. writes: "The accompanying diagram is of a roof truss for span of about 64ft., being the diagonal truss to a square of 45ft. The main scantlings are marked upon it. I should be glad to know whether they are of sufficient strength for a slate roof of 45 degrees pitch?"

The first step will be to find the loads upon the truss. In Fig. 1, ABCD shows plan of roof with four diagonal half-trusses, the load supported by one half truss is shown by the portion over which the purlins are drawn. The full lines represent the purlins, and the dotted lines the space on each side carried by the purlins. The allowance for structural load is 28lbs. per ft. super., and for horizontal wind pressure 42lbs. per ft. super. The wind is taken as coming on the side where the arrow is shown, from which the area under pressure is taken, but the direction is assumed to be in line with the diagonal, as otherwise a very awkward problem is introduced. Two opposite half trusses must be taken together as the loading is not symmetrical. The load on each purlin from the wind being found in the horizontal direction, the triangles of pressure to give the normal in each is shown upon Fig 2. This normal is then combined with the structural load and the resultants used to form the line of loads in Fig. 3. The frame diagram Fig. 2 is numbered throughout, and the stress diagram constructed up to point 19. A difficulty is then found and substituted members *a b*, *b* 24, 25 *c*, and *c d*, are inserted as shown by dotted lines. The stress diagram will then be found to close up properly. Now having obtained points 24 and 25, we draw in the stress diagram lines 24—23 and 5—23 to get point 23; then 23 to 20—21 and 19 to 20—21 to get point 20—21. Then 20—21 to 22 and 13 to 22 to give point 22. Similarly, on the other side, points 26 to 29 may be found. The nature of the stresses may then be indicated by thickening those members that are in compression, but it should be observed that unless there is some special reason for the complication shown, a much better truss would be obtained by using the substituted members as real members and doing away with the others. Taking the principal rafter of the size suggested, viz., two 5in. by 3in. by ½in. angles, having a sectional area of 7·5 square inches and unsupported length of 8ft., the calculation will be $W = \dfrac{FS}{1+\frac{1}{a}\left(\frac{l}{d}\right)^2}$

$$= \frac{6{\cdot}5 \times 7{\cdot}5}{1+\frac{1}{750}\left(\frac{96}{5}\right)^2}$$ = say 33 tons, while the maximum stress is 58.3 tons. It is therefore evident that a stronger section is required. Try two 7in. by 4in. by ½in. angles, then $W = \dfrac{6{\cdot}5 \times 10{\cdot}5}{1+\frac{1}{750}\left(\frac{96}{7{\cdot}2}\right)^2} = 55{\cdot}04$ tons safe stress against 58.3 tons actual stress, so that this section may be adopted. For the main tie the maximum stress is 51 tons. Allowing 6½ tons per square inch net area $\frac{51}{6\frac{1}{2}}$ = say 8 square inches are required, and deducting for rivet holes, say, two 7in. by 4in. by ½in. angles, as for the principal rafter. The stresses in the remaining members may be scaled off Fig. 3.

Henry Adams.



ILLUSTRATING REPLY TO GLOUCESTER.—"J. F. T.

CONTRACTORS' SECTION.

(MONTHLY.)

"APPLICATIONS" UNDER THE LONDON BUILDING ACT.—II.*

By B. Wyand.

Width of Roadway.

The erection of buildings within the prescribed distance from the centre of the roadway can only be carried out under a consent from the Council in cases where any portion of the site which is proposed to be built on has not been at a certain time previously occupied by a building or structure. This question is governed by section 13 of the Act of 1894 and sections 3 and 4 of the Act of 1898. A give-and-take policy is here of great assistance in clearing up difficulties. Often a portion of the site was previously occupied by a building, and may be built on if the necessary plans are certified as correct by the district surveyor. Thus, if the erection of a building on a new site within the prescribed distance were absolutely prohibited, an irregular frontage would result. But both parties may be satisfied, the owner agreeing to give up a certain amount of land to the public way and the Council allowing him to build up to the edge of the surrendered land on the whole of the frontage. The exact amount of land to be given up will be a matter of arrangement; the architect acting for the owner must make application showing what land he proposes to surrender, and his application will be then considered on this basis. If the offer is not thought to be reasonable, consent may be refused, but it will be of course open for him to make a further application showing a larger area of land to be given up. Land hunger and its economical gratification are very much to the front at Spring Gardens.

It must not be forgotten, however, that the sections preclude the erection not only of a building but also of the fence or boundary of the forecourt if within the prescribed distance, unless consent is first obtained. In a case of this nature it is open for an application to be made for the giving up of land to the public way, and the setting back of the forecourt wall. Or instead, consent to the erection of the wall at the extreme boundary of the site may be asked for, and it is possible under certain circumstances that such consent may be given if it is agreed on by the owner to remove the wall when called upon to do so. Possibly, as in the case of buildings of a public or shop character, there may be no need for a forecourt wall; but in the majority of cases, especially where the house is occupied as a residence, a forecourt wall is almost essential.

Reference has been made to the fact that buildings on previously built-on sites may be erected within the prescribed distance if certified plans are obtained; but dwelling-houses to be inhabited or adapted to be inhabited by persons of the working class are an exception. Unless the consent of the Council is obtained, no such dwelling-houses may be erected within the prescribed distance in the City, and within 20 ft. of the centre of the roadway in the rest of London, so as to exceed the distance of its front wall from the opposite side of the street. So here is another case in which an application under section 13 of the Act of 1894 may be necessary. Section 4 of the Act of 1898 should also be quoted in the application, as in this section the words "20 ft. from the centre of the roadway" are stated, except in the City, to be substituted for the prescribed distance mentioned in section 13—no small consideration when one is erecting a working-class dwelling to abut on a footway.

General Line of Buildings.

Of equal importance with section 13 of the Act of 1894 is section 22 of the same Act, which prohibits the erection without the consent of the Council of buildings in advance of the general line of buildings, except on a site lawfully occupied by a building or structure at the commencement of the Act, or at any time within seven years previously. These provisions do not, however, apply in the City of London, which is exempted from the operation of the whole of Part III. of the Act of 1894, in which part section 22 is contained. The whole question turns on what is the general line of buildings in the particular street in which it is proposed to build. The general line has been defined in relatively few streets, but it will be well at the outset, in any case, to ascertain at Spring Gardens whether any such general line has been defined. If the answer to such enquiries is in the negative, as will be probably the case, then until such a time as the general line is defined by the superintending architect, against whose decision there is an appeal to the Tribunal of Appeal, the line is entirely a matter of hypothesis. If in the opinion of the architect of the proposed building the provisions of the Act relative to the general line will not be contravened by the erection of the building, he may decide to go ahead and risk being pulled up by the authorities. If he has a strong case, this may be the soundest course for him to adopt. But to take the bull by the horns in such a manner may not be to the liking of the majority of persons. Thus a more usual course may be to make the application for consent, and, where it will appear that the case is not a strong one, no doubt an application is the best course to adopt. The circumstances will have great influence on the result.

If in the opinion of the Council's officials there is uncertainty or doubt as to there being a contravention of the Act, consent will no doubt be graciously given. If, on the other hand, it is considered that the building will project beyond the general line, consent may be refused, or, if it is granted, may be subject to conditions. Section 26 of the Act of 1894 specifically states that the Council may attach any conditions to a consent, more particularly that the land in front of the building may to such an extent as is thought proper by the Council be dedicated to the public, or that the building may be used only for such purposes as specified in the consent. In some cases a portion of the site may have been occupied by a building, and may be built though in advance of the general line of buildings. Here occurs an opportunity for negotiation with the powers that be, which, if taken advantage of, may greatly assist the interests of the building owner. Section 27 of the Act should be noted, for this states that no consent of the Council shall alter the general line as existing previous to that consent. The whole question being based upon, in the vast majority of cases, a hypothetical general line, the advantages to be obtained by tact, together with sound experience, are by no means inconsiderable.

Height and Air Space.

The provisions of the Act of 1894 with respect to height of buildings and air space may in certain respects be departed from with the consent of the Council. Where a building is situated at the corner of two streets, it is open to the Council, despite the ordinary provisions of section 41, to allow the erection of buildings not exceeding 30 ft. in height upon such part of the space at rear as they may thereto fit, provided that they do not interfere unduly with the access of light and air to adjoining buildings. Also any part of a domestic building may extend beyond the diagonal line at the rear, provided the Council, or upon appeal, the Tribunal of Appeal, may be satisfied that an open cubic space of air will be provided equivalent to the open space which would have been provided if the ordinary provisions of section 41 had been complied with. Applications in these cases require to be accompanied by drawings prepared in a somewhat more elaborate and comprehensive manner than was necessary under the sections previously mentioned. A good knowledge of section 41 of the Act of 1894 is necessary to enable an architect to obtain the best results with regard to the rear portion of his building.

Applications under sections 42 and 44 of the same Act with reference respectively to the erection of working-class dwellings not abutting on a street, and in the laying out of a cleared area, also require fully explanatory drawings. The desirability of preparing in the first instance a good set of drawings showing off the proposed scheme to the best advantage is accentuated by the fact that under both sections applicants dissatisfied with the Council's decision may appeal to the Tribunal of Appeal, a remedy which, if a reasonable scheme has been brought forward, will be likely to be made use of, when full drawings will be essential.

Section 43 of the Act, which deals with the

Re-erecting of Domestic Buildings,

is contradictory. The first subsection states that if a certificate is obtained from the district surveyor as to the correctness of the plans of the old building, the new building may be erected so that no more land may be occupied by it than was occupied by the previous building, thus presumably allowing the plan to be varied subject to no larger area of land being built on. The second subsection, however, distinctly states that if the person erecting the domestic building desires to deviate in any respect from the plan or plans certified by the district surveyor, he must apply to the Council. This latter subsection has been strengthened by a case decided in the courts. Mr. Bernard Dicksee, in his book on the London Building Act, states that the first subsection was altered to its present form in Committee of the House of Lords, but the second subsection was not altered—thus the apparent contradiction.

Height of Buildings.

The provisions of the Act of 1894 controlling the height of buildings may also be departed from if consent is first obtained. This remark applies both to section 47, which limits the height of buildings to 80 ft., measured to the top of the parapet, or to the top of the external wall if there is no parapet, and to section 49. This latter is to the effect that in streets less than 50 ft. in width, and laid out after 1862, no new building may be erected or existing building raised so as to exceed in height the distance of the front wall from the opposite side of the street. It is possible that circumstances may occasionally occur which may render an application under this latter section a subject for hope. As regards the former section, it is not often that a client will desire to exceed the limit of 80 ft., and unless the proposed building is on an exceptionally big scale it is very doubtful whether the limitations of height would be waived to any appreciable extent.

Recesses and Openings.

Not a few of the constructional requirements of Part VI. of the Act of 1894 may be departed from by consent. Among these are the provisions of section 54 with regard to recesses and openings in external walls, and recesses in party walls. It is noteworthy in this instance that it is the superintending architect who, in accordance with any rules made by the Council, may consent to any modifications or relaxations of the requirements. Then, again, it is possible to obtain exemption from the rules as to timber in external walls, and as to the rules for the construction of furnace chimney shafts laid out in such full detail in section 65. It may not often be thought desirable to depart to any great extent from the requirements with regard to construction, but variation is possible, and this is a privilege which it is well not to lose sight of.

---

*For the first part, see page 3 of the issue for January 6th.

"Projections"

next demand attention, and it is important to note that in the preface to section 73, the words "except with the consent of the Council" are contained. Thus it is possible to obtain exemption from any one of the numerous requirements contained in this section; or if total exemption may not be reasonably expected, possibly the authorities may still allow some little relaxation in matters of detail. To enumerate at length all the detailed requirements of this section would be sufficient in itself for a lengthy article. Sufficient be it to summarise the section as referring to (1) general projections, (2) balconies and cornices, (3) shop fronts, (4) bay windows, (5) oriel windows. There will no doubt often arise occasions in the practice of nearly every London architect when it will be necessary for him to make an application under this section. A careful perusal of the wording of the various requirements will be desirable in order carefully to note the whole of the points which require to be applied for, and also it will be well to see whether in some instances the proposed building or structure is well within the limits of the section, as these may be utilised as the basis of a plea for exemption in other respects.

Under the provisions of the recently passed L.C.C. (General Powers) Act, 1908, sections 75, 76, and 77 of the Building Act of 1894 are repealed. The new Act gives the Council power to consent to additional cubical extent without limitation, and also to consent to openings of any size in division walls, and to allow other than iron doors to be provided to such openings. The Act, in short, gives the Council unlimited power in respect of the cubical extent of all buildings used for trade or manufacture, and there is no right of appeal against any decision of the Council. Buildings for the supply of electricity may, with the consent of the Council under section 203 of the Act of 1894, be exempted from any of the provisions of the Act. In all cases in which the question of cubical extent is involved, the plans accompanying an application require to be liberally supplied with sections, and the heights carefully figured.

"Special and Temporary Buildings and Wooden Structures"

is the heading to Part VII. of the Act of 1894, and with the exception of buildings specially exempted, no building or structure which comes within the scope of this part of the Act can be erected except by consent. Special buildings or structures can only be erected under a consent from the County Council under section 82; and to come within the scope of this section they must be "buildings or structures to which the general provision of Part VI. are inapplicable, or in the opinion of the Council inappropriate having regard to the special purpose for which the building or structure is designed and actually used." The exact scope of these phrases appears to be difficult to determine. Buildings and structures of an engineering character are not infrequently erected under this section, and the Council in such cases usually require very full details of the construction, and demand to be fully satisfied as to stability before they issue their approval. Section 84 is now administered by the Metropolitan Borough Council, while licensing powers under section 83 are still retained by the County Council.

There is no definition of "wooden structure," and the course to be adopted with regard to wooden sheds is often a doubtful question, for the Borough Councils are now the licensing body under section 84 with regard to wooden structures, while the County Council can under section 83 license "an iron or other building or structure of a temporary character." Each case must be taken upon its merits—possibly even an application unsuccessful in one direction may be more fortunate in another. The period for which licence may be expected to be obtained is not more than three years, and at the expiration of this period it is probable that a renewal may be obtained if a certificate of structural stability is obtained from the district surveyor. All applications under this part must be accompanied by a fee of 5s.

A Dispiriting Job.

One of the most dispiriting jobs I ever had was in connection with a "special" building which I wished to erect for a client at Hackney. My client was a manufacturer of rubber goods, and the petroleum inspector had requested him to provide a detached building for the carrying out of a certain definite process, the work in connection with which necessitated the use of highly inflammable material. The building I designed was 12 ft. by 6 ft.—a mere shed was all that was required—framed in angle and tee iron, and covered with corrugated sheets—fireproof, in fact, throughout. No wood entered into its composition, and I anticipated no trouble from the County Council, especially having regard to the fact that I was backed by their own inspector. I submitted complete plans as required under the Act, together with the fee of 5s.; and then the trouble began. Special plans were called for with ½in. scale details. I was requested to call at Spring Gardens and explain, to call again and interview the architect; in fact, as much fuss was made as though I were going to erect a Ritz Hotel. I remember one official claiming exception to the ⅜in. bolts. "We can't concern ourselves with eighths of an inch here," he said, magniloquently, and scored my carefully prepared detail drawing with blue pencil in half a dozen places. To object to his proceeding would have meant certain rejection of the plans, so I had to grin and bear it. One objection raised was that I had not submitted a proper block plan, certain adjoining buildings not being shown: and I could not convince this official that these buildings having been burned down and the charred ruins alone remaining they hardly required delineation upon the plan. I had, in the end, to submit another plan! To cut the matter short, I offered at last, in despair, to "place the structure on a cart and bring it down to Spring Gardens for inspection," and I think this must have brought their folly home to them, for some two months later my plans were approved. My fees came to nearly as much as the cost of the structure.

Dwelling-Houses on Low-lying Land.

Before any person may erect or adapt a building to be used wholly or in part as a dwelling-house on land the surface of which is below the level of Trinity high-water mark, and which is so situate as not to admit of being drained by gravitation into an existing sewer of the Council, he must make application for a licence. Such an application must, as has been previously stated, be addressed to the Clerk of the Council. The chief engineer of the Council shall give his decision upon such application, and the Council will act upon his decision and inform the applicant whether or not a licence will be granted. Trinity high-water mark is roughly 12 ft. 6 ins. above Ordnance datum. In dealing with the subject of consents, mention must be made of section 207 of the Act of 1894, which states that it shall not be lawful *unless with the consent of the Council*, to alter a building so as to make it not in conformity with the provisions of the Act applicable to new buildings. Hence applications may be made under this section.

Modifications and Relaxations.

Such are the sections of the London Building Acts of 1894 and 1898 and the L.C.C. General Powers Act, 1908, having reference to the formation of streets and the erection of buildings under which the Council have power to admit of modifications and relaxations. Before submitting an application, the leaflet issued by the Council which has already been referred to, should be studied, and the drawings prepared in accordance with the colour scheme and of the scales required. The leaflet is in some respects, however, out of date. It contains particulars of the form of application to be made under the repealed sections having reference to cubical extent, and under section 63 of the Act of 1894 for means of escape from the top floors of buildings over 60 ft. in height. This latter section is repealed by the Amendment Act of 1905.

Means of Escape in Case of Fire.

This Act now demands consideration. It is no doubt common knowledge that its operation is wholly restricted to requirements relating to means of escape in case of fire. No regulations appear to exist for the submission of plans other than those contained in the Act. Applications for exemption seem to be possible under but two sections, section 10, which concerns the reconstruction of the roofs of certain projecting shops, and section 12, under which dormers, trap-doors, or other means of access to roofs, may be required in certain existing buildings, and all new buildings having more than two storeys above the ground storey or exceeding 30 ft. in height. In both sections it is stated that the Council, or, in the event of an appeal, the Tribunal of Appeal, may sanction the exemption of a building from any or all the provisions of the section. There is nothing to indicate that plans are required to accompany an application for exemption under these sections. Presumably a letter of application is all that is legally necessary. The submission of plans will, however, often be desirable, particularly under section 10, for exemption in such a case may depend upon the character of the means of escape from the house at the back of the projecting shop, and favourable points might be lost if not clearly indicated upon the plan.

Compulsory submission of plans, rather than the optional submission of applications for relaxation, is required by the other principal sections of this Act. Although rather outside the scope of this article, the subject may be lightly touched upon, inasmuch as common ground occurs in connection with the preparation and submission of plans. Section 7 requires that before a new building is erected except a dwelling-house occupied by not more than one family, which is a high building, i.e., has a floor at a greater height than 50 ft. above the footway, or which is to sleep or to be occupied by more than 20 persons, it shall be provided, in accordance with plans approved by the Council, with such means of escape in case of fire as can be reasonably required under the circumstances of the case. It is distinctly stated in the section that the plans may be sun-prints or reproductions. Other cases in which plans showing means of escape must be submitted are those of buildings coming within the operation of the Factory and Workshop Acts, and those of theatres and other places of public resort which come within the scope of the by-laws made under the Metropolis Management Amendment Act, 1878.

Before making an application or determining any point whatever under the Building Acts a copy of the Acts should be obtained. The man who has the strongest grip of the subject will none the less be the last to trust to memory.

FAIR WAGES CLAUSE IN GOVERNMENT CONTRACTS.

To-night (Wednesday) Mr. Hodge, M.P., intends to propose in the House of Commons the following resolution:—

"To call attention to the Fair Wages Clause in Government contracts and its administration; and to move, That, in the opinion of this House, the Fair Wages Clause in Government contracts should be so amended as to provide that the contractor shall, under penalty, pay to all the workmen in his employ not less than the minimum standard rate of wages recognised by trade societies in the district where such men are employed, and shall observe the recognised hours and proper conditions of labour; and if there shall be no such standard rate of wages or recognised hours and proper conditions of labour in that district, the contractor shall pay to such workmen not less than the minimum standard rate of wages recognised by trade societies customarily executing such class of work in the nearest district, and observe the recognised hours and proper conditions of labour prevailing in respect of the particular trade in the nearest district in which such men are employed; also that the contractor shall be prohibited from sub-letting any portion of his contract, except where the department concerned specially allows the sub-letting of such special portions of the work as could not be produced or carried out by the contractor in the ordinary course of his business; and any such sub-contractor shall be subject to the same conditions as the contractor."

The matter is of importance to builders, because if the resolution is accepted by the House its effect will be largely to override the main conclusion of a report recently rendered by a Treasury Committee appointed to consider the working of the Fair Wages resolution of the House of Commons of February 13, 1891, as embodied in Government contracts.

The main conclusion of the committee was:—

"We recommend that the present wording of the Fair Wages Clause, which obliges the contractor to pay the current rates of wages for competent workmen in the district where the work is carried out, should be retained.

"While we do not recommend that words intended to enforce the observance of 'Trade Union conditions' should be inserted in Government contracts, we think that such conditions of employment as are generally accepted in the district in the trade concerned must be taken into account when considering the question whether a particular contractor is observing the Fair Wages Clause."

The present wording referred to is shown by the following extract from the War Office conditions of contract:—

"No portion of this contract shall be transferred without the written permission of the Secretary of State for War. Sub-letting, other than that which may be customary in the trades concerned, is prohibited. The wages paid in the execution of this contract shall be those generally accepted as current in each trade for competent workmen in the district where the work is carried out."

"The representatives of the trade unions who gave evidence before the committee desired that instead of the expression 'The wages paid in the execution of this contract shall be those generally accepted as current in each trade,' the clause should require the contractor to pay the Trade Union rate of wages and observe the Trade Union 'conditions.' By 'Trade Union rate' the witnesses with few exceptions intended a rate agreed upon with the employers and actually in force and under Trade Union 'conditions,' they included the regulation of the hours of labour, the proportion of apprentices to journeymen, employment of boys, women, and girls, and some other matters."

The committee, on a careful review of the evidence, failed to see how the substitution of the phrase "Trade Union rate of wages" for "current rate of wages of the district" would enable the objects of the Fair Wages resolution to be more effectively attained, because, in practice, "if in a given district the Trade Union succeeds in establishing a rate which is so far accepted by employers that the majority of the workpeople in that district do in fact obtain the rate, then the Trade Union rate is the 'current rate' of the district, and is the rate which the contractor under the present form of contract already is compelled to pay on Government work carried out in the district."

The committee further point out that it is only in those cases "where the Trade Union rate is not the current rate, that any change would be effected by the proposed amendment, and in such cases the Government would hardly be justified in imposing the Trade Union rate on its contractors."

"A rate demanded by a Union, but not in practice obtained, or a rate agreed on by only a minority of employers and workpeople, or which by change of process has become obsolete, can scarcely be the 'current rate' intended by the Fair Wages resolution, or represent the market price of labour, which is all the Government should pay for its work."

"Where there is no Trade Union the proposed form of clause becomes meaningless."

The foregoing remarks have been quoted freely from the committee's report because they cannot be gainsaid by any fair minded person cognisant of the facts.

The committee concluded "not to recommend that the words 'Trade Union rate of wages' should be substituted for 'current rate,' because such a modification would be either superfluous or inequitable."

They further remark "that the proposed enforcement of 'Trade Union conditions,' in addition to the rate of wages, met on the whole with great opposition from the employers who gave evidence, although some had no objection to the enforcement of such conditions as had been mutually agreed on."

The obvious intention, therefore, of the motion which Mr. Hodge is to propose is to over-ride the considered judgment of an impartial committee which has heard and carefully weighed the evidence of both employers and employed.

To those who know the kind of Fair Wage Clause which the Trade Unions are constantly trying to have adopted by public bodies in all parts of the country, the wording of the motion signifies a good deal more than it expresses.

It begins by saying that the contractor shall *under penalty* do certain things.

As an example of what the operatives mean they have put forward at Oldham the following clause as to penalty:—

"Failure on the part of contractors to comply with any conditions set forth in this clause shall leave the council power to cancel the contract or call upon defaulting contractors to pay to the council any sum not exceeding £500. From any sum so obtained payments shall be made to workmen to cover any loss which it may be proved they have suffered by breaches of any of the conditions herein stated."

This is a very different thing from the usual penalty clause for breach of contract which governs all such breaches, and is subject to an arbitration clause. The workmen want a special penal clause for their especial benefit, and one which would be oppressive to contractors.

The motion goes on to say: "Pay to all workmen in his employ not less than the minimum standard rate of wages recognised by *trade societies* in the district."

Fair Wages Clause in Government Work.

Now the usual meaning attached to the words "trade societies" is workmen's Unions, and if this is what the mover means, then the plain intention of the resolution is to compel the employers to pay whatever rate the "Trade Union" decide to be the standard rate, whether the employers agree thereto or not, and whether they are able to obtain an ample supply of non-union labour at lower rates or not. If however a wider interpretation is given to the words "trade societies," and they are meant to cover societies of both employers and employed, the expression is ambiguous, because there is no provision for agreement, and if the employers' society recognises one rate and the workmen's another, the situation becomes absurd. In either case neither the Trade Unions nor the employers' societies, in the building trade at all events, represent more than 20 per cent. to 30 per cent. of those engaged in the industry, and the net result of such a resolution being approved and put into practice would be to compel all contractors for Government work and all operatives desirous of working on Government contracts to join the trade societies in order to have at least a voice in the matter.

The motion goes on to say that if there be no recognised rate, etc., in a district, then the rate and conditions of the nearest district shall prevail in the district having no rate.

This again means more than appears on the surface. Many factories exist in country districts near large towns or cities. They go there, among other things, to obtain cheaper labour, and such labour is obtainable without hardship to the worker because living is cheaper in such places.

The smallness of the population in country places and the scattered positions of the factories, make it difficult for a rate recognised by trade societies to exist, and generally no such trade societies are to be found in such districts, as it does not pay to organise there.

The movement of factories from town to country is on other grounds recognised as a desirable movement and an increasing one.

The effect of the proposal put forward by Mr. Hodge would be to compel employers in such places to pay the rate prevalent in the nearest town or city, generally 5 per cent. to 10 per cent. higher, and to entirely check this so desirable migration of workers from town to country.

It is to be hoped that employer Members of Parliament will not fail to expose the fallacies and unfairness underlying this apparently simple proposal, and that the Government will not be constrained to throw over the very fair and thoroughly practical report of their Treasury Committee.

It is evident that the Fair Wages Clause adopted for Government contracts is likely to serve more or less as a model for other public bodies, and any special features secured by the workmen are sure to be pressed upon such bodies as having been adopted in Government contracts.

Employers' associations should carefully watch this question of Fair Wages Clauses wherever it crops up, and steadily oppose sound commonsense to the doctrinaire proposals so frequently put forward by the workmen's representatives in the shape of fair wages clauses. With the ostensible object of a fair wages clause employers quite sympathise, and where workmen take the employers into their confidence and invite their co-operation in the drafting and presenting of suitable fair wages clauses, they will readily attain such objects. We do not think they really mean to insist on impracticable proposals once they realise their impracticability, but the men should remember that only those who wear the shoe know where it pinches; and while this statement is true of their case it is equally true of the employers' case, and that in common fairness they should join at the drafting of all such clauses as are here treated of.

Mr. Yates, who has just been installed as president of the Institution of Heating and Ventilating Engineers, is a member of the well-known firm of Matthews and Yates. He is also chairman of the Swinton and Pendlebury Council Electricity Committee, and is a member of the Manchester Association of Engineers.

FINCHLEY GARDEN VILLAGE.

This modern village, which is being developed under the auspices of the Finchley Co-partnership Society, Ltd., is on a portion of the Grass Park Estate, Church End, Finchley. The site is well suited for the purpose, surrounded as it is by a typical bit of English scenery. The scheme includes a large central green, around which the majority of the houses will be grouped, and also a prettily wooded recreation ground, through which winds a brook well stocked with fish. The houses are designed in a simple style with various kinds of plaster work, green weather boarding and sand-faced tiles. The majority are semi-detached with about 30ft. frontage. The first section has been carried out by Messrs. Neward and Shadbolt, builders. The architects are Messrs. Bennett and Stratton, of Finchley, N.

Proposed New Works.

ABERDEEN.—Plans for the following works have been approved by the Town Council:—Alterations, dwelling-house, 93, Crown Street, for Mr. George Wood, per Mr. Harvey Mennie, architect; alterations and additions, premises, for the Aberdeen Mutual Sawmilling and Boxmaking Company, Ltd., per Messrs. Taylor and Anderson, solicitors; alterations No. 10, George Street, for Messrs. J. Hepworth and Son, Ltd., clothiers; alterations Nos. 141, 145, and 149, Union Street, for Dr. George W. Park, Penang, per Messrs. J. and A. Edmond, advocates; dwelling-house, Westburn Road, for Mr. Adam Copland, painter, per Mr. Arthur C. Bruce, architect; aerated water manufactory, Seaforth Road, for Messrs. Sang and Co., per Messrs. Jenkins and Marr, architects; three dwelling-houses, King Street, for Mr. Henry Hutcheon, per Mr. Duncan Hodge, architect; workshops, St. Clair Street, for Mr. William Adams, cartwright, per Mr. William Smith, architect.

BEXHILL.—The Town Council has approved plans for the following works:—Six detached houses, Woodville Road, Mr. J. W. Webb, owner; Mr. J. B. Wall, architect; detached residence, Little Common, Mrs. Hitchins, owner; submitted by Messrs. Stevens and Son.

BRADFORD.—A proposal to rebuild the Royal Infirmary was made at a meeting, on February 26th, of the donors and subscribers, presided over by the Lord Mayor. The sum of £150,000 to £200,000 was indicated as the probable cost.

NOTES ON BRICKS AND BRICKWORK.

By Alfred B. Searle

WHY SOME BRICKS LAY BADLY.

When bricks were all made by hand the bricklayer's chief concern was to obtain bricks of a sufficiently accurate shape so that the joints would be of even thickness and the general appearance of the work satisfactory. With hand-made bricks the nature of the clay used and the temperature at which it is fired are both in favour of the bricklayer, and the only source of trouble is the irregular shape and size of some of the bricks, especially when clamp-burnt bricks are used. Consequently, most hand-made bricks will lay well, providing that they are sorted with reasonable care, the badly shaped bricks being reserved for filling up or backing.

With the increasing difficulty in obtaining skilled men as moulders, which has been experienced during the last few years, and with the enormous demand for cheap bricks in large quantities, which has been so characteristic of the last two decades, it was only natural that use should be made of machinery to supplement the output, and for a long time past the machine-made brick has increased in popularity and usefulness, until it is the chief product of most of the brickworks in the country, hand-made bricks being confined to small yards and sparsely populated localities, with a few notable exceptions.

Fortunately or otherwise, the application of machinery has resulted in the production of a brick of entirely different qualities from those possessed by bricks made by hand, and whilst the newer styles of bricks can be made more accurate in shape, and often more even in colour, many bricklayers find that when in use the structure is not as strong as it should be. In other words, the bricks do not "lay" well.

The causes of this trouble are of three main types—those connected with the absorptive power of the bricks, those allied to the burning of the bricks, and irregularities in composition due to the less thorough or insufficient treatment accorded to the clay. Of these the first is by far the most important, as it is on the power of adhesion between the mortar and the brick that the strength of the brickwork depends.

It is almost impossible to lay bricks made of a smooth and non-absorptive material (such as polished glass) satisfactorily, for there is nothing to which the mortar can adhere, and whilst it is not true to state that the strength of the brickwork depends on the water-absorbing power of the bricks, this characteristic is an important factor in a consideration of the subject.

For most purposes bricks should absorb at least one-sixth of their weight of water, and many bricks will absorb as much as one-fifth or even one-quarter of their weight, but these must be regarded as more porous than is either necessary or desirable. A very high porosity or water-absorbing power implies that a brick has not been fully burnt, though too much stress must not be laid upon this statement, as certain sandy clays will not make dense and non-porous bricks. The higher the temperature reached in the kiln the greater the probability of dense, strong, but non-porous bricks being produced. This high temperature is all to the good up to a certain point, but beyond this the bricks will soften and twist or warp, or in other ways lose their shape, and their colour will be changed. Even when heated to a temperature just below the softening point, whereby the bricks attain their maximum strength, it may happen that the colour produced is considered undesirable by the customers, and the lack of porosity may prejudice the bricklayers against the use of a brick which is in many ways superior in durability and strength to others from the same clay fired at a lower temperature.

The brickmaker must therefore effect a compromise according to the class of trade for which he caters: he may aim at producing a hard and dense brick suitable for engineering purposes on account of its great strength, or he may prefer to manufacture a stock brick of less strength but more easily laid, and of a very pleasing colour. It is only in exceptional cases that a brick can combine the characteristics of both these classes.

Many bricks made from a shale or easily vitrified clay will produce work of great strength, providing the bricklayers understand their work properly, but these bricks are usually vitrified at the surface (though porous enough in the centre), and unless the mortar used partakes more of the nature of a cement than an ordinary mortar, the adhesion will not be so great as could be wished. Certain well-known bricks are of a peculiar nature in this respect, as owing partly to the method of manufacture employed and partly to the material from which they are made, it is difficult to get mortar to adhere properly to them unless they are "keyed" in some way. All bricks of low porosity are subject to the same disadvantage from the bricklayer's standpoint, but their greater strength more than compensates for this when the bricks are employed for engineering purposes.

There is an increasing tendency to favour the use of partially vitrified bricks, and in an important book for architects recently published, it is definitely stated that no brick should absorb more than one-tenth of its weight of water, *i.e.*, it should only be half as porous as the average brick made fifteen years ago. Whilst much may be said in favour of this low porosity, it is not likely to increase the popularity of bricks with the men who have to lay them.

In testing the porosity of a brick, it is important to decide whether a whole brick or a broken one should be tested, as the two will not yield the same results in all cases, particularly if the bricks are vitrified near the surface, but are more porous internally.

Bricks which are uneven in composition will not lay well on account of the great variations in colour, and if improperly burned it will often be found troublesome to use bricks which are broken into two pieces so as to provide a proper bond. These characteristics are, however, all easily observable to the ordinary bricklayer, and are less likely to cause trouble some time after the masonry has been completed than are bricks to which mortar does not easily adhere.

It must not be forgotten that many bricks are said to lay badly when it is really the fault of the mason and not of the brickmaker. Thus a wall may prove to be weak because the mason has not taken sufficient care in slushing the joint with mortar, in keeping the bricks down to a tight joint, or to the mortar not being spread evenly over the top of the lower course. It is not uncommon in erecting cheap houses to find that the bricklayers place a "dab" of mortar at each end of the brick, and so leave a hollow space in the centre, which is a source of weakness instead of strength to the structure. When this is done with "butter" joints, the weight of the wall may be sufficient to cause the bricks in the lower courses to spall. This may be entirely avoided by taking care that the centre of the bed is properly supplied with mortar.

Bricks are sometimes blamed for weakness when the real evil is a faulty bond, for one of the chief sources of strength in a wall is the headers used in its construction. In fact, no high wall can be built securely unless an ample supply of headers is provided; it would collapse. In any case, it is essential that no wall should be built without there is a header course or its equivalent in at least every five courses, and it is better to have every third course constructed of headers. It is not, of course, necessary that these headers should be seen from the face of the wall, and, if desired, a "secret bond" can be employed.

Another cause of difficulty in laying bricks is due to the architect overlooking the fact that a thoroughly sound bond can only be made if the various parts of the building are made to brick dimensions. If this is not the case, the bricks must be cut or rubbed to fit, and this is both time-consuming and costly. On this account also bricks should, as far as possible, be made to certain well-defined sizes, and notable variations from these "standard sizes" should be rejected except for special work. This is most necessary when hard pressed bricks are used. Bricks of unusual size or shape are always more costly, though if used alone or in connection with work into which they bond properly, no special difficulty need be experienced in the laying.

In short, some bricks are difficult to lay because of the defects in their manufacture—they are out of shape, or too close in texture —whilst with others the fault is with the bricklayer himself, or with the architect.

THE FORTHCOMING BUILDING EXHIBITION.

The nearer the approach to the opening date of the forthcoming Building Trades Exhibition at Olympia, the greater the force of its promoters' contention that no such trade exhibition as that of April next will prove to be has ever been held in this or any other country. Olympia has become the acknowledged home of successful trade exhibitions. It is the largest building of its kind in London. Yet the promoters of the Building Trades Exhibition are hard put to it to find suitable accommodation for all the would-be exhibitors.

The galleries represent a complete municipal section for the special requirements of borough surveyors, while from end to end of the Main Hall and Annexe, every available inch of space has its quota of exhibits allocated exclusively for the use of the architect and the builder.

We are glad to observe from the plan of the forthcoming exhibition, which we have had an opportunity of examining, that every branch of the building trades is again most thoroughly represented. Not only are all the firms who had the most prominent positions at the record exhibition of 1907 again in evidence (in many cases with increased spaces), but many well-known firms will be found exhibiting this year for the first time.

The exhibition will therefore afford a unique opportunity of examining under one roof all that is most up-to-date in building and its direct accessories.

The Yorkshire Master Painters' Federation attains its majority this year, and the event has been celebrated at York, where the Federation was welcomed by the Lord Mayor of York. An exhibition of apprentices' work was an important feature of the celebration, and the awards in the competition (in which the judges were Councillor Hibbett, Mr. Ward, and Mr. Chappell) were as follows:—Class I. Apprentices over 18 years and under 21 years of age.—Glass writing: 1, E. Dean, Bradford; 2, G. S. Bellerby, York. Sign writing on wood: 1, L. Lancaster, Hull; 2, E. Dean. Graining, plain oak: W. H. Maslin, Hull; pollard oak, G. A. Sykes, Paddock; mahogany, E. Dean; Italian walnut, G. A. Sykes. Tinting: G. S. Bellerby, York. Marbling (black and gold): H. Marshall, Bradford; specially commended. G. A. Sykes. Plain painting: 1, "Tong," Huddersfield; 2, G. Lancaster. Decoration frieze: 1, A. Colley, Hull; 2, G. Lancaster. Time test, graining panels: H. Wadsworth. Gold Medal, given by the president: Edward Dean, Bradford. Class II. Apprentices under 18 years of age.—Glass writing: 1, A. Bennett, Bradford; 2, C. Wood, Hull. Sign writing on wood: 1, Chas. Wood, Hull; 2, Arthur Bennett, Bradford. Graining: Plain oak, Charles Wood, Hull; pollard oak, C. Wood; mahogany, C. Wood; American walnut, C. Wood. Tinting competition: A. Bennett, Bradford. Marbling: Red granite, C. Wood. Plain painting: 1, A. Bennett; 2, W. Abbey, York. Decorative frieze: 1, "Don," Huddersfield; 2, A. Barton, York. Vice-President's silver medal: Charles E. Wood, Hull.

Photo: Topical.

GENERAL VIEW OF THE LONDON AND SOUTH-WESTERN RAILWAY DOCK EXTENSION, SOUTHAMPTON.
TOPHAM, JONES AND RAILTON, CONTRACTORS.

BROMSGROVE.—The R.D. Council have approved plans for the following works:—Addition to Mission Room at Barnt Green; alterations to Ewe and Lamb Inn, Stoke Heath; house at Hopwood for Mr. J. Smedley Crooke.

COLVEND, NEAR DALBEATTIE.—It is proposed to build a new church here. About £800 has been subscribed, and the committee are endeavouring to arrange for a site.

DERBY.—The L.G. Board have held an enquiry respecting an application by the Town Council to borrow £12,000 for the extension of the Borough Lunatic Asylum. There was no opposition.

DUNDEE.—Plans for the following new buildings are before the City Council:—American Muir Road, Downfield, alterations on property for A. M. Neill: Lochee Road, temporary warehouse for Ballingall and Son, Limited; North Lindsay Street, stores, etc., for Halley Brothers, Limited; Old Craigie Road, cottage for William Lilburn, semi-detached villas for B. Anderson, alteration on dairy premises for D. C. Guthrie; Russell Street, workshop for John Nicoll; South Ward Road, warehouse for Don Brothers, Buist, and Company, Limited.

EASTBOURNE.—The Town Council has approved plans for the following works:—Eastbourne Ice Co., addition to ice works, Beach Road; E. Littleton, six houses, Archery Road; Eastbourne College Co., Assembly Hall, Eastbourne College; T. H. Sawyer and Sons, eight houses, Victoria Drive; Eastbourne Gas Co., addition to warehouses, rear of Sussex Gardens.

EDINBURGH.—The Provincial Committee for the training of teachers are looking for a site for a central training college.

ETON DISTRICT, BUCKS.—The R.D. Council have approved plans for the following:—House in Marsham Way, Gerrards Cross, for Mr. E. G. Hodgkins; bungalow at Cippenham for Mr. A. Chennells; house in Chesham Road, Denham, for Mr. W. A. Smith; pair of cottages at Burnham for Mr. W. Guiseley; house in Marsham Way, Gerrards Cross, for Mr. H. Greeves; house in Parsonage Lane, Farnham Royal, for Mr. R. C. Hankinson; dairy at corner of South Park and Oak End Waye, Gerrards Cross, for Mr. J. H. Maggs; house, Pack Horse Road, Gerrards Cross, for Messrs. Franklin and Fisk; house in Bulstrode Way, Gerrards Cross, Mr. T. M. Browne; house, Layter's Way, Gerrards Cross, for Mr. C. P. Lovell; pair of cottages, in Wexham Street, Stoke Poges, for Mr. F. Hartley; two cottages, One Pin Lane, Farnham Royal, for Mr. F. H. Pullen; roads on the Park Estate, at Gerrards Cross, for the London and Country Investment Company.

GLASGOW.—Linings have been granted at the Dean of Guild Court for the following works: — The Hyndlands Building Company, to erect five tenements of dwelling-houses at the corner of York Drive and Airlie Street, Hyndlands; St. Mungo Property Co., Ltd., to erect a garage and repairing shop at 304, Byres Road.

HALE, CHESHIRE.—A new Congregational Church is to be built here at a cost of from £8,000 to £10,000, of which about £4,000 has been collected.

LONDON, W.—The new Radium Institute, of which His Majesty the King is patron, is to be erected in Riding House Street, by the Queen's Hall. Mr. T. Phillips Figgis, F.R.I.B.A., of 28, Martin's Lane, Cannon Street, E.C., is the architect. The building will be in two parts with separate entrances. One section will be devoted to the necessitous patients, and the other to the well-to-do. The former will be treated free of charge, while the latter will be required to pay fees on such a scale as the medical and surgical staff may determine.

SWANSEA.—The Corporation Asylums Committee has requested Mr. G. T. Hine, F.R.I.B.A., F.S.I., of 35, Parliament Street, London, S.W., to visit Swansea for the purpose of inspecting sites in or near the Borough suitable for a new asylum.

TWICKENHAM.—The U.D. Council are selecting a site for a new elementary school at East Twickenham.

WEASENHAM, NORFOLK.—Under the will of the late Earl of Leicester, a sum of £5,000 has been left for the restoration, decoration, and furnishing of All Saints' Church.

Obituary.

We regret to announce the death of Mr. Cole Alfred Adams, F.R.I.B.A., of 66, Victoria Street, S.W. Mr. Adams was born at Sudbury in Suffolk in 1845, and died on February 21st, at 13, Glazebury Road, Chiswick, after a three months' illness. He was with Mr. Street for some years, and was engaged on the church at Bournemouth designed by Mr. Street. In the year 1867 he was presented with a number of architectural books by the various public institutions in Bournemouth, in recognition of the valuable services he had rendered to them. He was for some short time in the office of Mr. Butterfield, and has often spoken of the useful discipline that was exercised in that office. He started practice in Westminster, and was elected an associate of the Royal Institute of British Architects in 1874, and a Fellow in 1880. In 1880 he joined the Architectural Association, and took an active part in its work from the first. In 1884 he was elected president, and was paid the compliment of a second year in office. At that time the presidency was usually only for one year. He was the first architectural association president to be elected on the Council of the Royal Institute of British Architects. He was joint secretary with Sir Aston Webb of the Competitions Memorial Committee, and took an active part in the reforms that have been introduced into competitions. He also was on the Board of Examiners. Those who were associated with him became sincerely attached to him. He always treated everyone with a courtesy that made them respect him, and this, with his simplicity of purpose, made him a charming colleague to work with.

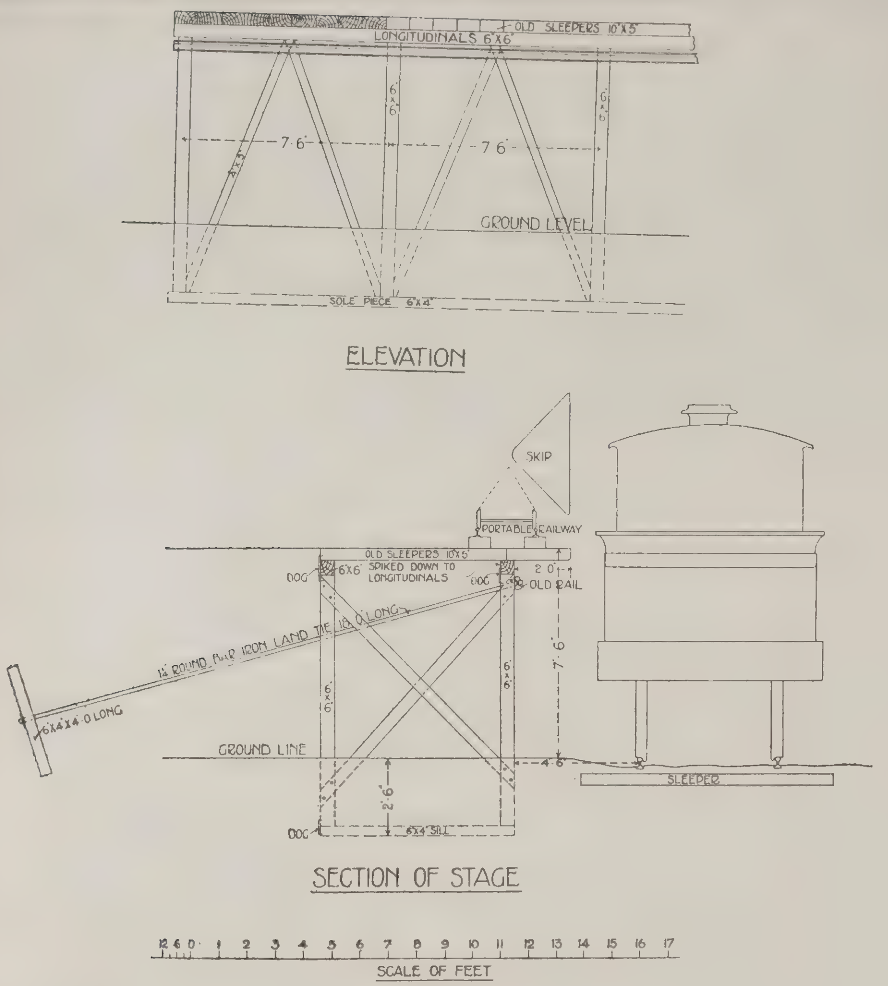
Perhaps it was his white hair which gave him a venerable appearance and made his presence take the character of an elder brother in the family party, but he never presumed on this feeling, and to the last always explained his opinion with almost an apology for differing from others in the discussion.

One of his great hobbies, and the side of his profession that he took the keenest interest in, was colour decoration, and for many years he conducted a colour class at the Architectural Association, and took a keen interest in the work of his class. He did a good deal of decorating work in private homes, and in 1902 exhibited at the Royal Academy designs for the decoration of the drawing-room of a house at the Boltons, South Kensington. He designed a mission church at Grinham; additions to St. Mary Magdalene, Trinity Road, Wandsworth Common; and the decoration of the screen at St. Andrew's, Stockwell Green; and his own church at Chiswick, where he improved and decorated the parish hall.

Mr. Adams, until his first illness, some two years ago, was for many years a powerful reciter, and as the testimonial given him at Bournemouth shows, was always at the service of good causes.

Mr. R. A. Nicholson, of Stockton-on-Tees, who has died at the age of 36 years, was formerly a builder and contractor in business with his father (Mr. R. Nicholson), who died two years ago. About four years ago he and his father built the Hippodrome Theatre at Stockton, and at the time of his death Mr. Nicholson, jun., was the sole proprietor. He was at one time a member of the executive committee of the Stockton-on-Tees Master Builders' Association.

It may be supposed that the attention that has been given to the design of the Marble Arch lamps will have an important influence on the future design of lamps in this country. The lamps, which have been made in Mr. Bainbridge Reynolds's workshops at Clapham, are fourteen in all. The four at the Royal entrance each weigh nearly one ton, and measure 9ft. 10½ins. from the base to the top. The style of the design is a free rendering of the Louis XVI. period, and the lamps are made of fine cast iron, the more delicate panels and ribs being in cast bronze.



A TIMBER STAGE.

A TIMBER STAGE

For Unloading Ballast or Coal at Railway Sidings.

By Hugh S. Cregeen, A.M.I.C.E., P.A.S.I.

The stage or dock illustrated is one suitable for erection alongside a railway siding, for loading or unloading ballast, coal, or other material, and is of such a height that the trucks can be conveniently worked from. The stage is 7ft. 6ins. above rail level, and the main front is kept 4ft. 6ins. away from the rail, so that plenty of clearance is provided and there is no danger of men getting jammed between the front and passing vehicles. It also complies with the Board of Trade regulations in this respect.

The construction may be stated thus:—6in. by 6in. uprights are braced together in bays, 7ft. 6ins. apart centre to centre, and having 6in. by 6in. longitudinal timbers back and front, on which good second-hand sleepers 10in. by 5in. are spiked to form a floor. The uprights are let into the ground about 2ft. 6ins., and rest on 6in. by 4in. sole pieces. The floor projects 2ft. beyond the main front of the dock, so as to get as close as possible to the trucks; and on this projection a narrow gauge railway or trolley road is laid, so that skips of materials can be easily handled. The skips are of the side-tipping variety, and a portable timber shoot enables ballast, etc., to be shot into the trucks with a minimum of waste. To further strengthen the stage and prevent any change of tipping, over-land ties, consisting of 1¼in. round bar iron, 18ft. long, attached to old rails fixed longitudinally along the front of the stage, are inserted at every alternate bay.

Messrs. Lovegrove and Papworth, of 374-8, Old Street, E.C., architects and surveyors, have succeeded to the practice carried on for many years by the late J. H. Richardson, at 22, King Street, Hammersmith, W. Both addresses and telephone Nos. are retained.

ROSYTH GRANITE CONTRACTS.

In the House of Commons, on February 22nd, Mr. John Ward asked the First Lord of the Admiralty whether Messrs. Easton, Gibb, and Son had made a start with the actual work of their contract at Rosyth; if so could he state the number of men now employed upon the works, and the wages paid to such men; whether competent men only would be engaged upon the works; or had his Department made any stipulation with the contractors to give preference to the local unemployed.

The Secretary to the Admiralty (Dr. Macnamara): I understand the contractors have not yet started work at Rosyth. They are required to employ competent men, and are not bound to give preference to the local unemployed.

Major Anstruther-Gray (U., St. Andrews Burghs): When is the work going to be started?

The Secretary to the Admiralty: I should think pretty soon.

Mr. Leverton Harris (U., Tower Hamlets, Stepney) asked whether the tenders for the construction work provided for the use of British granite; if not, from what country would the granite be obtained; what was the value of the granite which would be used; and what proportion of the value approximately represented wages.

The Secretary to the Admiralty: Contract prices were asked for British and foreign granite. In the tender accepted foreign granite is provided for. A sample of granite has not yet been approved, but the granite will probably come from Scandinavia. The value of the granite is estimated at about £105,000. British granite would have cost £134,000. It is not possible to say what proportion of the value approximately represents wages.

Mr. Leverton Harris: Can the hon. gentleman say whether a fair wages clause is insisted upon in British contracts, and whether a similar clause is insisted upon in foreign contracts? Can the hon. gentleman also give the House an idea of what wages are now being paid, and hours worked in the Scandinavian quarries?

The Speaker: The hon. member ought to give notice of that question.

Mr. W. Redmond (N., East Clare): May I ask whether any estimate for the supply of granite was asked for from Ireland, and whether the hon. gentleman could not see his way to get an estimate from Ireland before the order was given for Scandinavian granite?

The Secretary to the Admiralty: I assume Irish merchants could tender. Whether they did or not I cannot say. At any rate, the contract is now settled.

Mr. Redmond: Were the Irish granite quarry owners invited to tender?

No answer was given.

Mr. Chiozza Money (L., North Paddington): Will the hon. gentleman say whether granite is a raw material or a manufactured article?

Mr. Claude Hay (U., Shoreditch, Hoxton): Will the hon. gentleman cause an official inquiry to be made into the relative merits of British and foreign granite?

Mr. Myer (L., North Lambeth): Can the hon. gentleman say whether or not the wages in Scandinavian quarries are almost indentical with the wages in the quarries of this country?

The Speaker: The hon. member must give notice of that.

Mr. MacNeill (N., South Donegal): Having regard to the fact that the Scandinavian quarries have been preferred to the Irish, will the hon. gentleman say who are the owners of the favoured Scandinavian quarries?

The Secretary to the Admiralty: I cannot tell the hon. member without notice.

Mr. W. Redmond: Was a request for tenders published in the Irish newspapers?

The Secretary to the Admiralty: I must have notice of that.

Mr. Leverton Harris: Was a fair wages clause introduced in the contract?

The Speaker: The hon. member must give notice of that. It does not arise out of the question.

Many other questions, of similar import were asked at subsequent dates.

Law Case.

Locating a Leaking Pipe: Water Board Recovers Cost of Excavating & Reinstating.

The case of "The Metropolitan Water Board v. The Imperial Property Investment Company," heard in the Westminster County Court, recently, was a claim for 15s. 2d. on a point as to liability for expenses incurred in locating a leaking pipe.—It appeared that the defendants were the owners of property at Chiswick, and the Board claimed for certain work in connection with a leak in the pipe supplying those premises. Section 71 of the Act of last year read:—"If it should appear to the Board that by reason of any injury to or defect in any communication pipe, any waste of water or injury or risk of injury to person or property is caused or likely to be caused, it shall be lawful for the Board to execute such repairs as they may think necessary or expedient in the circumstances of the case, without being requested so to do, and the expense incurred by the Board in executing such repairs shall be recoverable by the Board as the water rates in respect of the premises are recoverable." The facts were admitted. The Board excavated, found a leak in the pipe supplying the premises, and gave notice to the defendants, who had plumbers of their own. The plumbers repaired the leak, and the Board reinstated. It was the expenses of excavating and reinstating that were claimed.—Counsel for the defendants said that, while the amount was small, the matter was of importance to the defendants. The claim was not for repairs, but for opening up the road. The Board had to find whether the leak was the fault of the consumer or not, and therefore had to open the road and lay bare the leakage. It was found to be the consumer's pipe, but it might not have been, and then the consumer could not have been called upon to pay anything.—Counsel for the Board drew attention to the Metropolis Water Act, 1871, under section 29, of which 24 hours' notice had to be given, and there might be 24 hours' waste of water. To prevent that the section he had read of the new Act was put in.—Judge Woodfall was of the opinion that plaintiffs were entitled to recover, holding that the expenses claimed were expenses of executing repairs. He thought it fair to read in "in and about." Having excavated, it was found that the concealed pipe was one for which defendants were liable, and the excavating was part of the expenses incurred. There would be leave to appeal. Judgment would be for the plaintiffs, with costs, and if defendants decided to appeal the costs would be on scale B.

Views and Reviews.

A Compendious Manual for Cement Users.

The Everyday Uses of Portland Cement. Published by The Associated Portland Cement Manufacturers (1900), Ltd., at Portland House, Lloyds Avenue, London, E.C. Price 2s. 6d. net.

The aim of this book, as set forth in the preface, is to supply "a comprehensive summary of what might be termed the domestic aspects of the subject, . . . upon which hitherto there has not been much reliable information available." It is not only a guide to the various uses for which Portland cement may be advantageously employed; it contains also much excellent advice as to the methodical and practical preparation and application of the material. Portland cement, it is pointed out, is essentially a British invention, having been discovered by Joseph Aspdin in 1824. It was called "Portland" cement from its resemblance, when set hard, to the famous Portland stone, but it was first made commercially in Kent. Lime concrete, of course, was extensively used by the Romans, and the domes of the Pantheon, and of the Baths of Caracalla and Diocletian exist in proof of its durability, which, however, is much inferior to that of Portland cement concrete. General observations on the nature, constituents, and characteristics of Portland cement, with a glance at the part it plays in reinforced concrete construction, are followed by sections dealing respectively with concrete blocks and moulded concrete, and with various descriptions of aggregates; the physical properties and the selection, proportioning, and general details of mixing and manufacturing; the details of workmanship in constructing and surfacing, with illustrations of the special tools required; reinforced concrete; and concrete blocks and moulded concrete. A large and very important section details various uses of concrete —for foundations and walls, fences and fence-posts, paths and pavements, garden steps and terraces, water troughs and reservoirs, tanks and swimming baths, pipes and sewers, culverts and bridges, churches and halls and dwellings, besides a large number of minor applications to the requirements of country and farm life. "Some Novel Uses for Concrete" include the construction of telegraph posts, tramway and electric light standards, signal-posts and name and notice-boards, railway sleepers, mine props, chimney shafts, shore protection, piles, boats, barges, and pontoons. Many pages of useful memoranda are included, and the book, which is well and copiously illustrated, is a most useful compendium for the cement user, whether lay or technical, and it should be of special value to those who are concerned in estate management. The Associated Portland Cement Manufacturers, Ltd., it is mentioned, employ fully 6,000 people, and their works have an annual capacity of approximately a million tons and a half, or more than ten million barrels; and this book is such an excellent guide and persuasive that the output should be sensibly increased as a result of its publication. Nothing could be better calculated to extend the knowledge of cement and hence to popularise its use. It answers all the natural preliminary enquiries, and many that are more advanced; for it is comprehensive and thoroughly up-to-date.

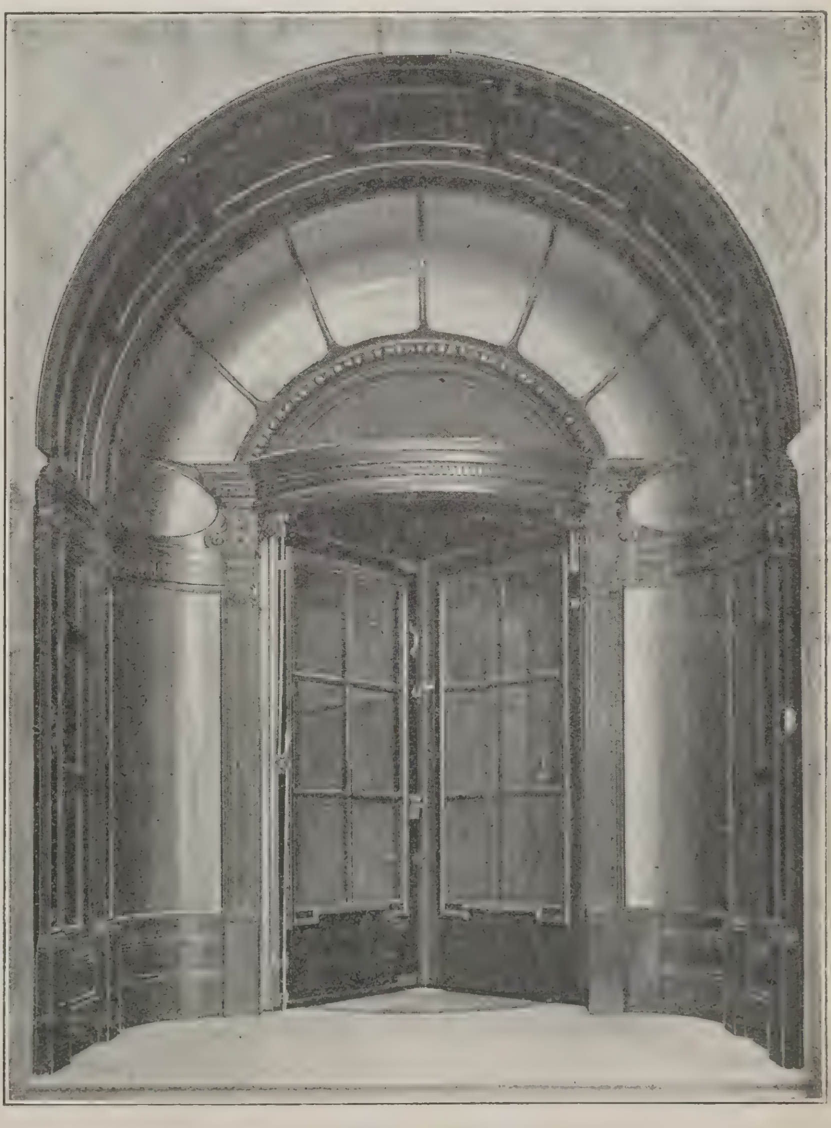
Trade and Craft.

Elliott's Improved Revolving Door.

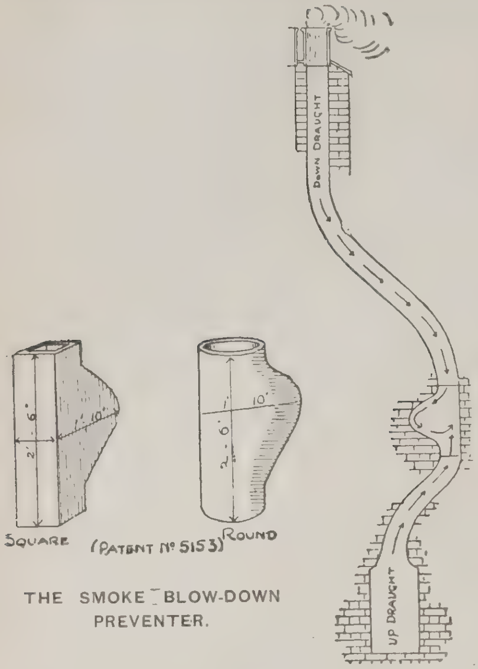
The great advantages of the revolving door —such as its prevention of the inconveniences to the inmates that arise from the opening of the ordinary door, and the inrush of cold air or of rain or dust, and the intrusion of noise, fog, or odour, from the street—were instantly recognised, and this form of door has been extensively adopted for hotels, banks, insurance offices, etc. At the forthcoming Building Exhibition at Olympia, in April next, architects will have an opportunity of examining an improved form of revolving door; or, if they do not care to wait until then, they may see the example that is giving so much satisfaction at the new Welbeck Palace Hotel, Wigmore Street, W., or the similar door that has been fitted at the Shire Hall, Norwich. Normally, the wings of the door radiate from a central axis at the angle shown in the view here given of the door at the Welbeck Palace Hotel. As a revolving door, it works easily and noiselessly, on ball bearings. It has been fully approved by the London County Council, whose requirements it fulfils in every particular. But its efficiency as a revolving door is not all. The wings or leaves are connected by detachable hinges, and, by the turning of a handle, they can be all folded together, bolted top and bottom, and pushed aside so as to leave a clear way through the door opening for the admission of bulky packages, etc. This improved patent door is manufactured by Elliott's Moulding and Joinery Co., Ltd., Albert Works, Newbury.

Prevention of Down-draught in Flues.

Most architects have experienced trouble with down-draught, and would be glad to hear of some simple means of curing what, in many cases, seems beyond remedy. Take the typical case of a house facing south, and built on the slope of a hill rising towards the north. Here, although the architect may have been specially careful in the designing of the flues, and in securing the height of the chimney cans, etc., yet the winds that blow from a northerly direction give rise invariably to complaints of down-blow. The remedy usually adopted is the placing of some pattern (usually very unsightly) of can on the top of the vent to stop the entrance of the downward draught caused by the deflection of the wind from the hill behind. These cans tend as a rule to decrease the draught in the flue, making the smallest pressure of wind on the top naturally more easily felt in a vent in which the draught has been lessened by the use of the can. This downward pressure of wind, descending the flue (which may have curves in its



ELLIOTT'S IMPROVED REVOLVING DOOR.



THE SMOKE-BLOW-DOWN PREVENTER.

longitudinal section) naturally decreases in proportion to the length of travel, the upward draught counteracting the downward. The use of a whirling can in order to increase the upward draught has many disadvantages that need not be detailed, to say nothing of its ugliness. What is required is some means of counteracting, arresting, or dispelling the downward run of pressure, and of giving the upward draught time to counteract it. This requirement is met by the formation of a bulged cavity in the cross-section of the vent. It is not always easy or convenient to get this shape built in brick or stone. The difficulty has been overcome by the patent "smoke blow-down preventer." This device, which is made of fireclay in one piece, to suit vents of all sizes in cross section, is formed of the exact shape required—that is, with the necessary curvative for performing the function indicated. An architect who has adopted it informs us that it has been extremely successful in houses situated in a district where, with the wind coming from certain directions, blow-downs are the rule rather than the exception. The "smoke blow-down preventer" is made by Messrs. Robert Brown and Son, Ltd., Ferguslie Fireclay Works, Paisley, N.B. The preventer is made either round or square, and it may be placed in any convenient and praticable part of the flue, between the fireplace and chimney top, preferably about 4ft. from the top of the fireplace opening, the curved or elbow-shaped enlargement being placed on the lower side of the flue oven. The accompanying illustration shows how a current of air descending the chimney is caught by the enlarged part of the flue and diverted upwards to the opposite side, whence it ascends with the updraught or current proceeding from the fire, thus preventing the smoke from being carried back into the apartment.

Waygood's Hydraulic Lifts and Hoists.

Messrs. R. Waygood and Co., Ltd., of Falmouth Road, Great Dover Street, London, S.E., have just issued the seventh edition of the section of their catalogue (Section 4, Part 3) referring to hydraulic lifts and hoists for passengers and goods. Hydraulic power is specially suitable for passenger lifts, as well as for raising heavy goods. Hydraulic machinery may be worked either on the low-pressure system, by water taken from the ordinary street mains; or by a high-pressure supply obtained by pumping water into an accumulator loaded with weights to the required pressure, which is usually 700lbs. per square inch. The lifts are of two types, direct-acting and suspended. The former are those in which the cage or car is borne directly on the top of a ram or piston. The latter term is self-explanatory. In Waygood's patent hydraulic balanced passenger lift, the weight of the car and load is supported entirely from beneath, and the whole strain on the machinery is therefore always in compression, thus ensuring the highest degree of safety. In Waygood's safety gear, which is illustrated in the catalogue, safety is assured even in the highly improbable—indeed almost impossible—event of five ropes failing simultaneously. Warehouse and wharf cranes, a high-pressure pumping plant, hydraulic accumulators, and various kinds of pumps, are illustrated in this very useful and up-to-date catalogue. It covers the whole range of hydraulic lift work, of which the firm have made a speciality for nearly forty years.

Coming Events.

Wednesday, March 10.

Northern Architectural Association.—Ordinary meeting of Council, 7 p.m.; ordinary meeting and Exhibition of Drawings, 7.30.

Thursday, March 11.

Paint and Varnish Society (St. Bride's Institute, E.C.).—Mr. A. F. Suter on "Technical Notes on Lac," 8 p.m.

Manchester Society of Architects (16, St. Mary's Parsonage).—Discussion on Students' Drawings, 6.30 p.m.

Sheffield Society of Architects and Surveyors (University, Western Bank).—General meeting. Address by Mr. Temple Moore, F.R.I.B.A.

Society of Architects (Staple Inn Buildings, Holborn, W.C.).—Special general meeting to Revise Articles of Association, 7.30 p.m. Fifth sessional meeting: Mr. J. Davies on "Specification and Inspection of Timber," 8 p.m.

Worshipful Company of Carpenters (Carpenters' Hall, London Wall, E.C.).—Mr. Thackeray Turner, F.R.I.B.A., F.S.A., on "Ancient Buildings and their Influence on Modern Architecture," 8 p.m.

Friday, March 12.

South-Western Polytechnic Institute, Chelsea.—Presentation of Prizes and Certificates, by Prof. H. A. Miers, D.Sc., F.R.S., Principal of the University of London, 8 p.m.

Saturday, March 13.

Northern Polytechnic Architectural and Building Students' Association.—Visit to St. Bartholomew's Church, West Smithfield, 2.30 p.m.

Edinburgh Architectural Association (117, George Street).—Visit to Westbank Brick and Tile Works, Portobello.

Architectural Association.—Fifth spring visit, to the Horseferry Electricity Generating Station, Millbank, 3 p.m.

Monday, March 15.

Royal Institute of British Architects.—Mr. Francis S. Swales, on "American Architecture," 8 p.m.

University of London (South Kensington).—Mr. Banister Fletcher, F.R.I.B.A., on "English Renaissance (and Modern) Architecture," 8 p.m.

Wednesday, March 17.

Northern Polytechnic Architectural and Building Students' Association.—Annual general meeting, 8 p.m.

Thursday, March 18.

Leicester and Leicestershire Society of Architects.—Mr. A. Herbert, A.R.I.B.A., on "F. W. Ordish, Architect, and an Exhibition of his Drawings."

Friday, March 19.

Birmingham Architectural Association.—Mr. G. Salway Nicol, A.R.I.B.A., on "Rome and Paris: their Architectural Relations."

Architectural Association (18, Tufton Street, S.W.).—Mr. J. A. Marshall on "A Lesson from the Past," 7.30 p.m.

Saturday, March 20.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

The annual report and statement of accounts has been printed and despatched to the respective federations in quantities as required, and should by this be in the hands of members. As showing the increasing volume of the Federation work, it may be mentioned that whereas in 1906 six pages sufficed for the annual report, in the 1908 report twelve pages were required.

The report of the Conference of Secretaries has also been printed, and copies have been distributed to the various Federations, and they should be by this in the hands of every local association.

The members of associations of twelve selected towns have been circularised *re* further support to the Official Journal.

The various fair wages clauses in use by London and provincial boroughs have been examined and considered, and a typical clause for the use of our local associations when dealing with the question of fair wages clauses has been drafted, and as soon as approved by the committee will be issued.

Letters dealing with a complaint as to Government Departments calling for tenders without supplying quantities have been addressed to the Board of Works and the War Office, with what result is not yet known.

Representations as to the probably adverse effect of clause 30 of the Housing and Town Planning Bill have been made to the President of the Local Government Board.

Members of Parliament have been communicated with stating our objections to a resolution on fair wages clauses which is to be moved by Mr. Hodge, M.P., on March 10th, and their assistance asked to defeat the resolution.

Some little difficulty arose lately at Derby as to calling together the local Conciliation Board to deal with a dispute. The Derby Association was advised to submit the dispute to the Board.

The various resolutions of the annual general meeting have been dealt with, and communications to various parties concerned have been made. Visits have been made and meetings addressed at the following places: Leeds, Leicester, Cambridge, and Bournemouth. The last-named association has intimated its intention to affiliate with this Federation as soon as the necessary general meeting can be arranged for.

Letters have been sent to Bedford, Reading, Tunbridge Wells, Barry, Carmarthen, Watford, etc., urging that attempts should be made either to resuscitate the local association or affiliate with the Federation, and offers have been made to visit the places and render assistance. No replies are yet to hand.

Arrangements have been made for a party of our members to visit the International Building Trades Exhibition on the evening of April 20th, at 5.30 p.m., on the invitation of Mr. H. Greville Montgomery, M.P., one of the directors, and circulars have been sent to the Federations giving particulars.

In this connection, it has been decided to hold the next meeting of the Journal Committee at 12 noon on April 20th, the Administrative Committee at 2.30 p.m. on same day, a meeting of the Northern Centre at 10.30 a.m. on April 21st, and a meeting of the Joint Committee under the N.A.O.P. Agreement at 2.30 p.m. on the same day; all at the London Offices of the Federation, 31 and 32, Bedford Street, Strand, W.C. The secretary is under engagement to address a conference of the Midland Centre Secretaries at Birmingham on March 25th. — A. G. WHITE, Secretary.

THE NORTHERN CENTRE OF THE NATIONAL FEDERATION

COMPOSED OF

The Lancashire, Cheshire and North Wales Federation, The Yorkshire Federation and The Northern Counties Federation.

Secretary: JAMES DENVER, Cromwell Buildings, Blackfriars Street, Manchester.

THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION

Secretary: JOHN TOMLISON, Cromwell Buildings, Blackfriars Street, Manchester.

LOCAL ASSOCIATIONS AFFILIATED TO THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION.

ACCRINGTON AND DISTRICT.

Secretary pro. tem.: R. Hall.

The first monthly meeting of the committee of the newly formed Accrington Association was held at the Railway Hotel, Accrington, on Thursday, February 25th, every member of the committee being in attendance, with the president, Mr. James Waddington, in the chair. The association being new, many matters of interest were discussed, namely, provision of a members' telephone card, the appointment of secretary, the consideration of the formation of local conciliation boards under the conciliation rules, and that the rules of the association be submitted to the Lancashire, Cheshire, and North Wales Federation before being printed, so that they would be in order, as it is intended to make application to the Federation for membership.

BARROW-IN-FURNESS ASSOCIATION.

Secretary: J. Baker.

The monthly meeting of the Barrow-in-Furness Association was held on February 27th. Prior to the ordinary business meeting, representatives of master plasterers and operative plasterers met to confer on the question of "tearing" being done by handy men instead of by skilled workmen; also the cementing of floors for wood blocks being done by bricklayers instead of plasterers. The question of indenturing apprentices was also referred to. After the interview was ended, the questions were more thoroughly discussed by the fuller meeting of members of the association, and arrangements were made which will, in all probability, satisfy the operatives.

The question of tendering for work without quantities, the giving of tenders to others than members of the association, and the matter of uniform rates for labour and material for retail work, was thoroughly discussed, and the decision arrived at will, it is hoped, do much towards the extension of the association.

BURNLEY AND DISTRICT ASSOCIATION.

Secretary: C. Astwood.

The first annual dinner of the Burnley and District Association was held on Saturday, February 20th, at Cronshaw's Temperance Hotel. Twenty-one members and friends sat down. After dinner, Mr. Samuel Smith, the President, took the chair. In his opening remarks, he alluded to the necessity now more than ever for combination amongst employers, and urged all the members to do their utmost to encourage those outside the Association to join it. He also intimated that the committee had in view the advisability of having the whole of the members together, say once every three months, when trade topics could be discussed.—Mr. Robt. Smith (of Messrs. Geo. Smith and Sons) advised the members to be very careful in signing for contracts, as some of the conditions would be found to be impossible for members of the Association to carry out. The National form of contract was to his mind the right one, and wherever he had the opportunity, he always advocated its use.—Mr. W. Schofield, slater, and Mr. J. W. Shuttleworth, also addressed the meeting.—The Secretary informed the meeting that three large firms of builders' merchants had joined the Association, viz., Messrs. Brooks and Brooks, the Burnley Brick and Lime Co., and Messrs. J. Duckett and Son, Ltd. He also brought to notice the "Builders' Journal" as the recognised paper for builders, and advised the extension of the inter-trading rule.

BURY AND DISTRICT ASSOCIATION

Secretary: R. Hall.

At the usual monthly meeting of the committee of the Bury Association several matters interesting to the association were discussed, amongst them being the question of sole-contractors bringing sub-contractors into the town from less-paid districts; the admission of new members, and the tendering of members to people outside the association under the intertrading rule.

LEIGH ASSOCIATION.

Secretary: S. Wigham.

The eleventh annual dinner of the Leigh and District Master Builders' Association was held in the Co-operative Small Hall, about seventy persons being present. After dinner the chair was taken by the President, Mr. J. W. Cowburn.

After the usual loyal and patriotic toasts, Alderman W. Bullen, J.P., of Liverpool, president of the Lancashire, Cheshire and North Wales Federation of Master Builders, proposed "The Leigh and District Master Builders' Association." He understood they had nearly all the building trade representatives of the district in their Association, and that was a very healthy sign. In the north they were renowned for their energy and their enthusiasm in the building trade interests. He was a south-country man, but he was sorry that as they went further south they found less and less interest taken in the organisation, and in the extreme south there was practically no interest at all. They were holding their next annual meeting at Portsmouth, to try and arouse some enthusiasm there. If those outside the organisation would only come in and see what they did, they would remain in it. In Leigh they were practising, as well as they knew how, the inter-trading rule. That was one of the best weapons they had. It was introduced into Liverpool a few years ago, and though he was at first opposed to it he recognised by experience that it was the best force they had for bringing those who were outside into the organisation. It did not require, and they would be the last to advocate it, to be harshly enforced. He hoped that by next year the Leigh Association would be able to say that there was nobody outside the Association. He understood also they at Leigh had had some experience of the conciliation scheme. They had had a great deal of experience of that in Liverpool, and he did not know that they were altogether enamoured of it; in fact, some of his friends went so far as to say they would have to give it up. He did not agree with that. They had certainly been very unlucky in the cases they had submitted to the Conciliation Board, and had lost more than they had won; still they had to be patient. The idea of conciliation was a good one. It was better for employees and employers to meet together and talk over their differences in a friendly manner than resort to the barbarous methods of strikes and lock-outs. Still they had to look facts in the

face. It was necessary for the Federation to get a reserve fund of £10,000, and he hoped the Leigh Association would try to get £5 a year for eight years for that purpose. When they had such a large reserve fund, they would be in a very strong position. That sum would be a kind of insurance, and when workpeople saw that they would pause before taking foolish steps. The Chairman, in reply, said it was ten years since the Builders' Association was formed in Leigh, and he was very proud of the steady progress it had made. They had now 65 members, and were on a solid foundation. He hoped the members would keep together, and if there were any masters outside the Association he hoped they would be persuaded to join at the earliest opportunity. Their relations with the operatives were of a very cordial nature, and he hoped that that happy state of things would continue. With regard to the reserve fund, he could assure Alderman Bullen that that would meet with their serious consideration.

Mr. A. E. Prescott, in proposing the Mayor and Corporation, and the Tyldesley and Atherton District Councils, condemned the Leigh Corporation for building municipal cottages. Those cottages were a charge on the rates. He thought the Corporation and the local councils ought, when they had work, to give it to members of the Association, for the masters were banded together and were not antagonistic to the operatives, and did not try to pull their wages down, but really got them to work under the best conditions. They had an agreement with the operatives, which was loyally observed by both sides. Moreover, all the members of the Association had all their workmen insured. The Corporation, when they were making bylaws, ought to consult the architects and builders, and then we should not have such idiotic by-laws as we had now. Some bylaws added to the cost of the buildings without benefiting the public one iota from a health or any other point of view. Dwellings could be put up at less cost if unimportant by-laws were not so stringently insisted upon.

Councillor C. Owen, J.P., in reply, said the Leigh Corporation did their best to work for the interests of the town, and if the Builders' Association would only make representations to them in regard to by-laws, their requests would get consideration. The Corporation only gave work to those who paid the standard rate of wages.

Mr. H. Harvey proposed "The Architects and Surveyors," and Mr J. Berry, in response, said that, in regard to the Corporation cottages, the Corporation were compelled to build them and the Local Government Board insisted on such specifications that the cost was £175 per house instead of about £120. The fault in that case was not with the Corporation.—Mr. H. Prestwich, in a maiden speech, also replied, and said builders ought to read the conditions of tenders before they signed them. Public bodies sometimes imposed unfair conditions upon builders.

Mr. J. W. Thompson submitted the toast of "The Chairman," and Mr. Cowburn replied.

ROSSENDALE AND DISTRICT ASSOCIATION.

Secretary: Robert Hall.

At the monthly meeting of the Committee of the Rossendale Association, the question of sending in priced schedules along with tenders was considered. On the report of one of the members that one of the borough surveyors insisted on this being done, it was ultimately decided that the secretary, along with one of the members, seek an interview with the said surveyor, and see what could be done in the matter. The question of membership of the association was under discussion, and the feeling was expressed that something more ought to be done, if possible, in trying to strengthen the association.

WARRINGTON AND DISTRICT ASSOCIATION.

Secretary: Bertram B. Moss.

The annual dinner of the members of the Warrington and District Master Builders' Association was held at the Patten Arms Hotel, on Wednesday evening, February 17th. Mr. Henry Collin (the president of the Association) presided, and among the fifty gentlemen present were the mayor (Alderman Forshaw), Mr. H. Roberts, J.P., Mr. William Bullen (president of the Lancashire, Cheshire, and North Wales Building Trades Employers Federation), Mr. Bertram B. Moss (secretary of the Association), Mr. T. Longdin (borough surveyor), Mr. James Deas (water engineer), Messrs. Percy Silcock, F.R.I.B.A., Segar Owen, F.R.I.B.A., Robert Garnett, and Albert Warburton, A.R.I.B.A.

After the customary loyal toast, Mr. H. Roberts proposed "The Town and Trade of Warrington." He suggested that in the present depressed condition of the building trade—although he hoped they had reached the end of a long, narrow, and gloomy lane —the Corporation might pass a little faster some of the public improvements which would assist in providing the opportunity for building operations on a more extended scale and relieve the condition of distress which the present condition of the building trade and the weather had brought about. The Mayor replied. Mr. Bullen, in proposing "The Warrington and District Master Builders' Association," said he noticed that the membership had gone up during the past 12 months from 33 to 62. That was in itself a good indication, because if an association could progress in these bad times he could not help thinking something good about it. He saw that they had sent in notice of their resignation. He read it with great interest, and when he ascertained the cause of it being sent he could not help thinking that he could see something between the lines. It was due to the workings of the Conciliation Board. In Liverpool they had had enough of the conciliation scheme as it existed at present. He did not run down conciliation itself, but found fault with the present scheme. No doubt those who thought the matter out in the first instance did their best and thought it would be a good thing for the trade, but at present he could not see where the conciliation as he understood the word came in. Workmen were using the scheme simply as a weapon to gain their ends, and he was not, therefore, at all surprised that the builders had given notice of resignation from the Federation (which he hoped would only be a temporary affair), in order that they might be able to fight their dispute with their workmen in their own way. The building trade was the leading industry next to agriculture, and yet at the present moment it was about the rottenest industry in the country. He spoke with some amount of feeling based on experience, as he had never experienced such bad times before. But a better tone now prevailed, and he thought they could look to the future more hopefully. The President responded. Mr. Bullen might not take it to heart, nor the Federation generally, that they meant to sever their connection with the parent Federation, but simply to put themselves in Court. They had just at the present time notices running in connection with two branches of the trade, namely, joiners and bricklayers, and they had felt for some time that if they had to submit to the ruling of the Conciliation Board to settle the matter with the workmen they would be worse off than if they tried to settle it amicably between masters and employees. He had no doubt that the same feeling which had existed in the past when they had had to meet the men would prevail, and that they would come to an understanding that would be equally just both to employer and employed. The toast of "The Guests" was submitted by Mr. C. W. Davenport, and responded to by Messrs. Percy Silcock, Segar Owen, Robert Garnett, and Albert Warburton. Mr. Silcock contended that work was done better if good fellowship and good feeling existed between builder and architect. There was not the slightest necessity to go out of town for architects and builders in the case of the erection of buildings. Mr. Owen said that no art had written its name so indelibly on the pages of history as architecture. That tradition rested with them to carry out in their simple way. It was not given to them all to do large work, but it was given to them to do sincere work. Mr. Garnett said he had many times read that the building trade employed the second largest number of people in its allied industries, but before he came into the room he had not quite realised what that meant. He thanked Mr. Davenport for his kind words with reference to his (the speaker's) profession. Mr. Warburton said he associated himself with the remarks which Mr. Silcock had made, more particularly with reference to the builders of the town. His short experience told him that they had every desire to do good and honest work, and that was very much appreciated by the architects. The toast of "The Corporation Official" was proposed by Mr. F. Warburton, and responded to by Mr. Longdin and Mr. Deas.

WIGAN AND DISTRICT ASSOCIATION.

Secretary: R. Hollows, A.C.A., etc.

In connection with the notice and counter notice of alterations to joiners' working rules in the Wigan district, further meetings of employers and operatives have been held, and the final meeting, at which terms could be arranged, was held on Thursday, March 4, the employers taking the stand that unless all points at issue could be settled, the whole of the points must go before the arbitrator for settlement. The operatives were against this, stating that if they could come to terms on several points, it was labouring the matter to have to start from the beginning again; but to this the employers would not agree, firmly standing by their first statement. Asked by the chairman (Mr. Johnson, J.P.) how they stood respecting the working hours and rate of wages, the men replied that they were of opinion that the time was now opportune for a reduction of hours to 49½ hours per week in the summer months, and to 44 hours per week in the winter months, and for an increase of pay to 9½d. per hour. In reply to the chairman, they stated that it was too much to expect a workman to sacrifice 3s. 9d. per week, through a reduction of hours, and that a rise of one halfpenny per hour on the 49½ hours would go towards making up the deficiency on the present week's pay. After private discussion, the operatives offered to come to terms on the basis that the wages stay at 9d. per hour until August next, after which they should be at the rate of 9½d. per hour. To this the employers would not agree, giving as their reason for objection that any increase in wages would have a deterrent effect on the public, preventing investment of money in property. The operatives thereupon offered to accept 9¼d. per hour and no less The employers stated that as far as they as a body were concerned the matter was at an end, as no increase in wages could be considered at the present time, and under the present condition of trade. Prior to further consideration, the operatives asked whether, if they accepted the 9d. per hour, the employers would agree to pay all overtime at the rate of one shilling per hour on all hours worked, each day's work standing by itself. To this the employers stated that they could not agree. On further private consultation, the operatives stated that they were willing to accept 9d. hour if they had allowed them the proposed hours of work in summer and winter months, and the alterations regarding overtime pay as set out in their notice to employers. The employers stated that they must have an allowance of at least six hours wherein overtime could be worked over the full working week at one penny per hour more than the standard rate of pay before the shilling rate of pay began to operate. To this the operatives stated that they could allow up to four hours at the extra penny rate, and after considerable parleying a compromise was arrived at by agreeing to five hours at the extra penny rate, before the shilling rate operated. The employers suggested an increase in the length of dates of winter months from November

1st to February 12th, as against the present dates of November 12th to February 2nd, to which the operatives agreed.

As regards the piecework and prepared woodwork rule, the chairman asked whether if the proposed new rule as demanded by the employers were allowed to drop, the operatives would undertake not to work for any person unless he was a bona-fide builder, and eligible for membership of this association. The operatives replied that the present prepared woodwork rule had worked well, and that they could not see that the extension of the boundary of five miles (within which all woodwork must now be prepared) to include any town in Lancashire, even where the wages paid at that town were on a par with the wages of this district, would benefit the trade of this district. The matter was not finally settled, when the meeting was adjourned until Monday, March 8th.

ORGANISATION.

Colne.

A meeting of the employers of Colne has been arranged for Wednesday evening, March 10th, when Mr. W. Bullen, of Liverpool, president of the Lancashire, Cheshire, and North Wales Federation, will attend and address the meeting on the importance of organisation.

Clitheroe.

Arrangements are being made to hold another meeting at Clitheroe, when it is hoped some progress will be made in the formation of an Association.

[When these associations are duly constituted, we shall be glad if the respective secretaries will at once communicate with the Editor of this journal.]

THE YORKSHIRE FEDERATION.

Secretary: J. DAVIDSON, 14, Park Row, Leeds.

The monthly meeting of the Executive Council of Yorkshire Federation was held at the Talbot Hotel, Kirkgate, Bradford, on Thursday, February 18th. Mr. W. R. Thompson (president) was in the chair, and 49 delegates were present from the affiliated associations. The minutes of last meeting were read and approved. The accounts, amounting to £50 2s. 10d., having been examined and certified as correct, were approved, and cheques were drawn in payment.

On the motion of Mr. A. W. Sinclair, seconded by Mr. T. A. Taylor, it was resolved, with respect to the question of cross-voting, to recommend the representatives of the Federation on the Conciliation Boards to urge the adoption of the amendment suggested by the employers when the proposal is being formally considered.

The president reported that the York case had been carefully and fully laid before the Executive Council and general meeting, with the result that the National Administrative Committee had been authorised to take action if necessary or expedient. On the motion of Mr. A. W. Sinclair, seconded by Mr. S. Coop, the Emergency Committee were instructed to obtain counsel's opinion as requested by the National Federation.

At the general meeting, the National Administrative Committee were requested to consider whether the National form of contract had worked satisfactorily or otherwise, and whether any amendments are necessary in the interest of builders. A letter was read from the National Secretary inviting the observations of the Federation on these points. Each local association was requested, on the motion of Mr. Harrison, seconded by Councillor England, to consider the matter at the next meeting, and forward their observations and recommendations to the Federation secretary before March 11th if possible.

It was stated that the Yorkshire Federation had been reported as in arrear with respect to reserve fund payments. On the motion of Mr. W. T. Ledgard, seconded by Mr. J. T. Levitt, the local associations were earnestly requested to give this fund their most urgent attention, and to contribute this year a sum at least equal to a levy of 3d. per cent. on wages.

It was reported that the Joint Committee provided under the agreement with the N.A.O.P. was now being constituted, and that a meeting would be called at an early date. A letter was read asking whether the Federation had any matters which they desire to place on the agenda for discussion at such meeting. On the motion of Mr. W. E. Biscomb, seconded by Mr. T. Lee, the matter was referred to the local associations for consideration and report to the Federation, for discussion at the next meeting.

Attention was drawn to the references in the King's Speech to the Housing and Town Planning Bill, and to the intention of the Government to bring in a Bill to establish Labour Exchanges and a Bill to establish Trade Boards in certain trades. A letter was read from the Employers' Parliamentary Council, stating that any Bills will be carefully watched with a view to appropriate action being taken. On the motion of Mr. W. T. Ledgard, seconded by Mr. A. W. Sinclair, it was resolved to request the Administrative Committee to urge strongly upon the Employers' Parliamentary Council the expediency of making representations to the Ministers having charge of the intended Bills, in order that they may understand and appreciate the interests of employers before committing themselves to a definite line of action or course of procedure. It was further resolved, on the motion of Mr. A. W. Sinclair, seconded by Councillor England, J.P., to request the National Administrative Committee to consider the advisability of immediate steps being taken by them to impress upon Ministers the value and importance of the great industrial safeguards afforded by the existing strong organisations of employers and workmen in the building trade, and of the incalculable trade and public benefit guaranteed by the mutual conciliation scheme, which might be seriously prejudiced if the trade can be brought within the scope of the contemplated Wages Boards by the decision and authority of a single Minister of the Government.

The minutes of the annual meeting of the Northern Centre and the January report of the Lancashire, Cheshire, and North Wales Federation, were read.

It was reported that the official visit of the members of the National Federation to the Building Trades Exhibition, to be held in London from April 17th to May 1st has been fixed for Tuesday, April 20th, at 5.30 p.m.

A letter was read from the York Association containing notices of alteration of rules, which had been formally given to the operatives. The object of the notices was to determine the walking area, and to define the boundary in which the working and conciliation rules apply.

A draft declaration as to freedom of workmen from physical or constitutional disability, to be signed on entering employment, was considered. On the motion of the president, seconded by Mr. J. Biggin, the form was remitted to the local associations, and they were requested to favour the Council with their views thereon at the earliest possible date.

One of the members called attention to a claim made upon him to restore certain asphalte work, which had been completed in accordance with the specifications three or four years ago. The sub-contractor who had carried out some of the work was not the one whose tender the principal contractor had based the tender upon, but one who had been substituted under the instructions of the architect. Some time ago, it was observed that the work was defective, and notice was given by the architect to the principal contractor to reinstate the work. Liability to do this was repudiated, and ultimately notice was given that a writ would be issued if the work was not reinstated, or its equivalent cost paid over in cash, within fourteen days. The contractor called in an expert to inspect the work, when it was found that the defect was absolutely attributable to constructional defects. The proprietors, having had the full facts laid before them, had written to the contractor suggesting that he should make an *ex gratia* contribution of £20 towards the cost of restoration, and if he accepted this suggestion they were prepared to give him a letter completely exonerating him from all blame and legal responsibility. It was reported that the member was considering this offer.

The president extended a cordial welcome to several members of the Barnoldswick Association who were present at the meeting. In responding, the Barnoldswick members drew attention to the serious and onerous nature of certain conditions included in the contract form issued by the West Riding County Council. The president stated that if the Federation were not favoured at an early date with the county architect's decision, a further interview would be sought, with a view to facilitating matters and obtaining more equitable conditions.

Councillor Mallinson, on behalf of the Huddersfield Association, invited the Federation to hold the next meeting in that town, and it was resolved, on the motion of Councillor England, J.P., seconded by Mr. A. Moulson, to hold the next meeting at Huddersfield, on Thursday, March 18th.

The representatives were entertained to tea by the president and members of the Bradford Association, to whom a hearty vote of thanks was accorded for their hospitality.—J. DAVIDSON.

BARNSLEY ASSOCIATION.

Secretary: J. Denton.

The monthly meeting of Barnsley Association was held at the King's Head Hotel, on Wednesday, February 10th, Councillor G. Haigh occupying the chair, and was supported by fourteen members. After the usual preliminary routine business, the main business of the evening was the proposed adoption of the inter-trading rule, on which there was an animated discussion. Correspondence was read from the secretary of the Sheffield Association, stating the beneficial results and the great increase in membership that had resulted from the adoption of the inter-trading rule, and Liverpool was cited as another instance of its successful adoption. The merits and demerits of the rule were debated at great length, and it was decided to leave the matter in the hands of the committee.

A committee meeting to consider and report on the inter-trading rule was held at the King's Head Hotel, on Wednesday, February 24th, Councillor G. Haigh, who occupied the chair, being supported by twelve members of the committee. The business of the committee meeting having been explained by the chairman, the matter was then thrown open for thorough discussion. The discussion ended with the adoption of a resolution to the effect that the Barnsley Branch should adhere to their old rule, which contains the indeterminate phrase, "where possible."

A very successful whist drive and social evening was held on February 18th, and was attended by about 140 members and friends.

THE NORTHERN COUNTIES FEDERATION.

Secretary: W. H. HOPE, Solicitor, Post Office Chambers, 14, Norfolk Street, Sunderland.

SOUTH SHIELDS.
Secretary J. G. Robertson.

The monthly meeting of the South Shields Association was held in the Victoria Hall on Tuesday night, March 2nd, Mr. T. Anderson presiding. There was a large attendance.

A long discussion ensued on the introduction by the secretary of the National paper's proposal *re* supply and training of apprentices, and much useful information was gained as a result.

On the question of the Sunderland and South Shields Water Company's attempt to enforce new by-laws, strong remarks were made by all as to the company's procedure. Instead of sending to our members written notices of the proposals, they had got their inspectors to go to builder after builder and give them oral instructions, asking the builders individually to take down the four proposed by-laws. On their coming to the secretary's office, he had absolutely refused, as had other members, to take them down, and asked the water company's inspectors to report that he wanted written or printed particulars. He wrote to the water company three times, even sending a registered letter, and at first no notice was taken of the letters, though afterwards they had been acknowledged. The secretary was congratulated on the stand he had taken, and the meeting expressed its determination to fight the matter out. The company are seeking chiefly to do away with all taps in yards.

The question of the corporation having on hand the amending of their by-laws to substitute w.c.'s instead of dry-earth closets was next under consideration. The members are certain that the main drains are not large enough for water carriage, and believe that if the scheme were adopted the resultant nuisance would be intolerable. It was felt that unless the main drains of the town were enlarged and relaid, the scheme would be impracticable; and a small committee was appointed to prepare a statement on the subject to submit to the council.

The members agreed to ask that the National form of contract should be altered as regards clause 32, so that clause 16 shall not be an excepted clause in same, and thus give the arbitrator more power without challenge to the powers of the arbitrator by reference to clause 16. They also wish to have added to same a clause to the effect "That the builders on the completion of the contract give up the plans, and architects give back to the builder his priced set of quantities."

THE MIDLAND CENTRE OF THE NATIONAL FEDERATION.

No meetings of the Midland Centre have been held since last report. The third annual conference of Midland Centre secretaries will be held at the Imperial Hotel, Temple Street, Birmingham, on Thursday, March 25th, at 3 p.m. The president of the Centre, Councillor H. Smith, West Bromwich), will take the chair, and Mr. A. G. White (National secretary) has promised to give an address. It is hoped that every secretary in the Centre will be able to attend.

Since the beginning of the year, the secretary has met at annual dinners the members of the following associations:—Mansfield, Burton-on-Trent, Leicester, Redditch, West Bromwich, Bromsgrove.—Very encouraging reports have been received as to the progress of organisation, and several associations, notably Mansfield, show substantial increases of membership. The Long Eaton Association has been re-organised, and Mr. C. Overmass has been appointed secretary; Mr. J. E. Jervis holding the office of honorary secretary.

Copies of the revised Midland Centre rules and of the National reports and minutes have been forwarded to the local associations for distribution among the members. Two or three copies of the report of conference of secretaries held in London on October 20th last have been sent to each association. Circular letters have been sent to the associations with regard to appointments to the Central Executive Council, the International Building Trades Exhibition to be held in London from April 17th to May 1st, and the proposed alterations to the National contract form. With regard to the last-named matter, several associations have expressed their approval of the form, and stated that no amendments are, in their opinion, necessary.—FRED. W. AMPHLET, secretary.

BIRMINGHAM ASSOCIATION.
Secretary: E. J. Bigwood, J.P.

There was a good attendance at the meeting of the committee of the Birmingham Association, held at 17 and 19, Colmore Row, Birmingham, on Wednesday, February 10th, at 3 p.m., the president (Mr. F. G. Whittall) in the chair.

The minutes of the last meeting of the committee, which was held on January 18th, were read, confirmed, and signed, and the minutes of the conciliation meetings with the carpenters, bricklayers, masons, plasterers, and labourers, held on February 3rd and 4th, were read. These minutes were fully discussed, and the following resolution was unanimously passed:—"That the employers' notices of alterations to the working hours be strictly adhered to; the ordinary hours of work to be from 6.30 a.m. to 5 p.m., and overtime to commence after 5.30 p.m. for all trades." It was also resolved:—"That during the winter months the employer, if requested, should open the job at 7.30 a.m., and provide a man to light a fire to enable the operatives coming from a distance to have their breakfast on the job."

The question of "night shifts" was next discussed. Mr. Whittall reported that some of the operatives asked for payment at the rate of time and a third, and some at the rate of time and a half, for this work. It was proposed by Mr. Albert S. Smith, and resolved: "That, should night shifts be required, payment be made at the rate of time and a quarter for such work to all trades."

A letter was read from the secretary of the National Free Labour Association, asking for a donation to their funds. The secretary was instructed to reply that this association was not in a position to subscribe.

The secretary was instructed to issue a

Messrs. J. B. Whitehouse and Ralph Webb were re-elected as the representatives of this association on the Executive Council of the Midland Centre of the National Federation.

REDDITCH ASSOCIATION.

Secretary: H. Huins.

As reported in last week's issue, the third annual dinner in connection with the Redditch Master Builders' Association was held at the Unicorn Hotel, Redditch, on Thursday, February 18th, the President (Mr. F. C. Huins) in the chair. A few additional particulars are now given.

Proposing the toast of "The Redditch Master Builders' Association," Alderman G. W. Hobson said he was glad to hear that the Association was in a flourishing condition, and that, with one exception, they had "roped in" every master builder in the town and district. He was also pleased to know that in connection with the Association there was a local committee, or board of conciliation. If any differences should arise between employers and employees the Association would do what it could to arrange a meeting with the representatives of the various trade unions, so that the difficulties could be discussed in a friendly way across the table, and perhaps, with the aid of a little tobacco, satisfactorily settled.

Responding to the toast, the President said he thought they had got to the rock-bottom of the period of trade depression, and there were signs of improvement close at hand. He mentioned that the firm that was still outside the Association had promised to join, and then they would have the whole of the builders of the district members of the Association.

Mr. J. Gross proposed "The Town and Trade of Redditch." The Council he said, were borrowing £15,000 for a new sewerage scheme. With respect to the electric light undertaking, he remarked that it had never paid, and he understood the position was worse this year than ever. Two reasons were assigned for this—because the price of the current had been lowered, and because of the introduction of the Osram lamp, which consumed less current, so that the consumer had less to pay.—In responding to the toast, Mr. T. Huins expressed his confidence that the staple trades were about to expand, when the building trade would see better and brighter days.

Mr. Huxley submitted the health of "The Visitors," and Mr. J. Brazier replied. The toast was also acknowledged by Mr. Grant, who said he was sorry to hear that the building construction class at Redditch was poorly attended. His firm insisted on the apprentices attending such classes, or they would not employ them.

Proposing the health of "The President and Vice-Presidents," Mr. F. Amphlet said he did not think he need impress upon them as builders the fact that they were not only members of a local association, but that they formed important units in the great organisation that covered the whole of the country. In the Midland centre they had some 24 Master Builders' Associations, and he was pleased to tell them that despite the depression in trade the organisation as a whole was in a very healthy condition. The Birmingham Association had adopted the inter-trading rule, and he had no doubt that in a few years' time the membership of the Birmingham Association would increase from 100 to 200 or 300. As to the work of the centre, Mr. Amphlet said last year they renewed the arrangement previously made for the insurance of their members against workmen's compensation risks. They were able to obtain terms by bargaining collectively with the insurance company that no builder could obtain individually. Not only could they get their insurance effected at a lower rate than in any other office, but they had the additional advantage of their policies being free from restrictions, and covering all risks. The Federation had made an arrangement with the "Builders' Journal" for that paper—which he thought he might safely say was the best trade journal in the country—to be the official organ of the Federation. Mr. Amphlet referred to the success achieved by various conciliation boards in settling disputes, and said he regarded membership of the Federation as a kind of insurance.

The health of "The Secretary" was heartily drunk, on the proposition of Mr. Newbould, who said the success of the Association reflected great credit on Mr. H. Huins, who had carried out his duties in a very able manner. In reply, Mr. H. Huins said it was with the greatest regret that he had to give up the position. It had been a labour of love, and in the discharge of his duties he had received the greatest assistance of the members. The Association was something more than a name. It had justified its existence, and as time went on it would become a very important and useful body.

THE EASTERN COUNTIES FEDERATION.

LOCAL ASSOCIATIONS AFFILIATED TO THE EASTERN COUNTIES FEDERATION.

CAMBRIDGE ASSOCIATION.

Secretary: C. F. Charlton.

The annual dinner of the Cambridge Association was held at the University Arms Hotel, Cambridge, on Thursday, March 4th, 1909. The president (Mr. Alderman J. Bell, J.P.) was in the chair, and was supported by the Mayor of Cambridge (Mr. Alderman W. P. Spalding, J.P.), Mr. A. G. White (secretary of the National Federation of Building Trades Employers of Great Britain and Ireland), the Borough Surveyor (Mr. J. Julian), the Solicitor to the Asssociation (Mr. A. J. Lyon), Mr. John Morley and Mr. Paul A. Macalister (architects of Cambridge), Mr. O. Papworth, Mr. A. Mason, Mr. W. W. Gray, Mr. Brereton Wright, Mr. Wm. Dawson, Mr. W. H. Jarrold, Mr. C. F. Charlton (secretary), and others, the number present being 26. After the usual loyal toasts, the toast of the National Federation of Building Trades Employers of Great Britain and Ireland was submitted by Mr. Wm. Lofts, of the firm of Messrs. Coulson and Lofts, and responded to by Mr. A. G. White, the secretary, who, having so little time at his disposal, owing to being obliged to return to London the same night, was only able to give a brief outline of the various matters connected with the Federation. The members were delighted with the presence of Mr. White, and regretted he was not more fully able to go into matters affecting the building trade generally. Mr. Councillor Sindall proposed the "Town of Cambridge," which was responded to by the Mayor. "The Architects" was proposed by Mr. C. Kerridge and responded to by Mr. John Morley and Mr. P. A. Macalister. "The Building Trade" was proposed by Mr. A. J. Lyon, and responded to by Mr. Saint. "The Visitors" was proposed by Mr. G. R. Kett, of the firm of Messrs. Rattee and Kett, and responded to by the Borough Surveyor, Mr. A. Mason, and Mr. O. Papworth. "The Chairman" was proposed by Mr. E. Willmott, of the firm of Messrs. Willmott and Sons, and responded to by the chairman.

HOARDING & FENCING CASE.

In the Sheffield Second Police-court, on March 3rd, James Martin, of 4, Club Street, Sharrow, a partner in the firm of Martin and Hughes, builders, appeared before the magistrates in response to two summonses, one under the Public Health Amendment Act (Section 34), the other under the Corporation by-laws. Mr. H. L. Coath, who prosecuted, said that defendant's firm were erecting six houses in Westwood Road, Nether Green. The street ended in a *cul de sac*. There were ten houses already erected at the far end of the street, and nine of these were at present occupied. The street had been open to the public since 1904, and was railed off by railings placed at the expense of the Corporation on one side. It appeared that the defendant, or his firm, had deposited plans in November last for the building of these houses, and the houses were in course of erection. The magistrates would be told that in building these houses the defendant had turned the street into a perfect building yard. He had in it sheds, building implements, loads of bricks, lime, and all sorts of materials.—Mr. Coath brought witnesses to show that the place was not properly fenced and lighted, and the residents living beyond the houses in course of erection were in danger of injuring themselves at night time.—Mr. A. Neal (appearing on behalf of the Master Builders' Association), to Mr. Duffey (Corporation Building Inspector): Is not this the same kind of fence that has been used from time immemorial for such buildings? Has this case been before the Suburban Highways, or is it a pure police prosecution?—Witness: It is a Corporation prosecution.—Mr. Neal: By whose authority? Has it been before the Highway Committee? Has it been before the suburban highways? You are not going to suggest that in every suburban building there must be closed hoarding?—Witness replied in the affirmative, and added that the policy was not a new one.—Mr. Neal: Do the Corporation adopt it in their own buildings?—Witness: Yes.—Mr. Neal remarked that this was a new departure, and it was disadvantageous for all building parties concerned. In this case the course adopted had been exactly the same as that followed in Sheffield within the memory of the oldest member of the building trade. The building material was put down and then fenced all round.—In answer to Mr. Coath, Mr. Duffey stated that for about forty-five yards the fencing was not lighted at night.—Mr. John Biggin, of Messrs. Biggin, Ash, and Son, one of the oldest builders in the city, said that the fence round the property was a good one. He had never known a case before in which the Corporation had asked for a hoarding to be placed between the building line and the footpath.—The Bench considered that the fence was sufficient for the purpose, and that it was sufficiently lighted. With regard to the charge relative to the hoarding, they imposed a fine of 10s.—In somewhat similar cases, heard at the same time and place, James Masson and Samuel Hancock were each fined 10s. for committing a breach of section 34 of the Public Health Amendment Act.

Commenting on the above cases, Mr. Thos. Smith, secretary of the Sheffield Master Builders' Association, writes as follows:—It has been an established practice in Sheffield from time immemorial not to erect close-boarded hoarding in such positions as those in respect of which the summonses were issued—viz., remote suburban *cul de sac* streets in which there is practically no traffic, and, indeed, with the tacit consent of the City Council, no hoardings whatever have been erected in many cases, and what is more, the Corporation itself in its own contracts has not provided close-boarded hoardings, nor do its by-laws require other than *sufficient* hoarding for the proper protection of the public. The two latter summonses were taken out under the Town Police Clauses Act.

As the subject of the summonses marked an important departure from established precedent, the matter was brought to the notice of the Master Builders' Association, who promptly decided to defend the cases in the interests of its members, and the matter was put in the hands of a local solicitor.

At the last moment the defects in the information on the summonses were discovered by the Police or Corporation, and the cases were allowed to be taken, not exclusively on the by-laws and Town Police Clauses Act, but under section 34 of the Public Health Amendment Act of 1890, and this move on the part of the prosecution saved the situation, though even then the case is not without its anomalies. It is inconceivable, however, why this section, which is adoptive, and which presumably has been adopted by the City Council, was not cited on the summonses in the first instance. The section referred to provides that "Every person intending to build or take down any building, or to alter or repair the outward part of any building in any street or court, shall (a) before beginning the same, unless the Urban Authority otherwise consent in writing, cause close-boarded hoards or fences to the satisfaction of the Urban Authority to be put up in order to separate the building from the street or court." So far, so good. But like all Acts of Parliament, through which the proverbial carriage and horses can be driven, the exact meaning of the requirements of this section is somewhat obscured for the want of punctuation. A comma after "close-boarded hoards," would have settled the technical inference one is entitled to draw from the wording of the section. "Hoard" has the misfortune to be a term which is not specifically defined in the Public Health Act, 1875, and one must perforce fall back on the common dictionary meaning, with the inevitable result that "hoard" as applied to an erection has only one meaning, viz., "a fence enclosing a house and materials while builders are at work." From the same authority one learns that a fence is a wall, hedge, or *line of posts and rails*, and the part of the definition italicized is the commonly accepted definition. From all this one arrives at the somewhat paradoxical conclusion that while a hoard is a *builders'* fence, a fence is not necessarily a hoard, and it is a moot point as to whether the compound adjective "close-boarded" was intended by the framers of the Act to govern "fence" as well as "hoard," as it is obvious that if a *builders'* fence were close-boarded it would cease to be a fence, and *ipso facto* become a hoard. It is then clear that a *builders'* fence cannot be close-boarded, hence the adjective cannot apply to the fence (Q.E.D.). But this technial point was not pursued.

Another interesting point in the case was that the defendants Martin and Hughes had merely continued an existing fence of posts and rails previously erected by the defendant Belton, who at Easter, 1908, was summoned for placing materials on the street without a fence at all, as has been done and is being done at the present time in other places. When the case came before the Court, the defendant Belton was asked if he had erected a fence since the summons had been taken out. He replied that he had, and the police-constable who laid the information corroborated, and said that the fence was satisfactory. And yet Belton was now summoned for the self-same quondam satisfactory fence being unsatisfactory, but as in the present case the fence had been removed since the summons was taken out, in consequence of the houses being completed. The case was evidently too flimsy for the prosecution to pursue, and the summons was unconditionally withdrawn.

A perhaps still more interesting point which was not brought out in cross-examination was that one of the witnesses for the Corporation in his evidence claimed that the Corporation did cause to be erected close-boarded hoardings on their own works, and cited as an instance the case of a lodge now in course of erection at Whiteley Wood, only a few minutes' walk from the buildings in respect of which the summonses were issued. But it could be shown that this close-boarded hoarding has only been erected within the last fortnight or so, and that while the cellars have been dug and the foundations laid, the works have been innocent of fencing.

The result of the decision seems to be paradoxical. The fence is both sufficient and insufficient. It remains for the Master Builders' Association to approach the Highways Committee in order to ascertain what precisely is required.

THE ANOMALIES OF "WALKING TIME."

The question of walking time is an old one, for which provision is made in the rules of several operatives' societies, and while in some rural districts it may still have a *raison d'être*, its operation in large centres of population, with modern facilities in the shape of trams and trains, has rendered its provisions more or less nugatory.

At Sheffield the matter has become acute, and on Friday, March 5th, a meeting was held at the Builders' Exchange to consider the advisability of abolishing altogether the rules in regard to walking time. Mr. A. J. Forsdike, the president of the Local Conciliation Board, presided, and there were also present representing the employers:—Messrs. W. W. Mears (president of the Sheffield M.B.A.), J. Biggin, Thos. Roper, W. Longden, T Eshelby, F. Fider, J. D. Cook, and T. Smith (secretary).

The employees were represented as follows:—Amalgamated Society of Carpenters and Joiners, Messrs. Thos. Wood, W. Lane; General Union of Carpenters and Joiners, Messrs. J. H. Blincow, F. H. Kent; Bricklayers (London Order), Messrs. J. L. Evans, R. H. Stanton; Bricklayers (Manchester Order), Messrs. H. A. Stone, F. Limage.

The Chairman, in opening the proceedings, gave a hearty welcome to the operatives' representatives, and mentioned that the meeting was purely and simply a meeting of Trades Committees under section 2 of the rules of the Conciliation Board, hence only the joiners and bricklayers were represented. They were met to consider the advisability or otherwise of doing away with Rule 7 of the Operative Bricklayers, and Rule 5 of the Operative Carpenters and Joiners. Walking time, he thought, was out of date. They would remember that when six years ago they had a long discussion, the result of which was that the boundaries for walking time were extended from 1½ to 2½ miles from the parish church, that the employers were of opinion that walking time should be abolished altogether. As they knew, the rule had not been working very satisfactorily, and there had been some difficulty in one or two cases quite recently, and the rule was not rigidly observed on many jobs, the operatives themselves being as much a party to its being broken as the employers. As employers they relied on the operatives' societies to call their attention to any infringement of rules, but as attention had only been called to the question on certain specific cases on Corporation or Education Committee jobs, they were entitled to conclude that the existing arrangement was perfectly satisfactory. As employers they wished to have rules which they could consistently carry out. The walking time rule, if rigidly adhered to, would increase the cost of work, and, especially in such times of bad trade as at present, one of the greatest problems that employers had to consider was how to get work done at the price they had for it. It was the duty of the workmen to see that they got as high remuneration for their labour as possible, but that view should not be taken to the exclusion of all others. They must also regard the position from a commercial point of view; and sooner or later they would be forced to consider how to get work done for less money than at present. During the past ten years the cost of labour on building operations had gone up enormously, but there had not been a corresponding increase in the cost of materials, which, as a matter of fact, were cheaper than ten years ago. With these points he was sure the operatives would see that there was some ground for the suggestion the employers were putting forward. When trade was good wages had gone up, and now that trade was bad wages had not gone done. In Sheffield and throughout Yorkshire though the matter had been discussed on several occasions, they had rigidly set their faces against lower wages. They considered that wages were low enough for the men who were prepared to do a fair day's work, and rather than lower the wages they preferred to assist in lifting the stamina of the men and getting them to realise that unless they earned their wages they could not have them for long. As builders they could not afford to be philanthropists; they must make business pay, or stand down and let someone else take their place. He wished the operatives to consider the position from a friendly and commercial standpoint, and not simply take up the position that because something had existed it must necessarily go on. In other words, they wanted the operatives to look at the matter not only from their own standpoint but also that of the builder. The facilities for getting about were very much greater than they were at the time the walking rule was instituted, and it now seemed arbitrary that if a man lived, from choice, outside the boundary, and availed himself of these facilities, there should be any talk about walking time as compared with the man who chose to live nearer the job. There had been a system in vogue for many years that when workmen were engaged and paid on the job, it was not customary to pay walking time, and that was another reason why the rule should be altered. If the Sheffield employers were compelled to pay walking time on jobs outside the boundary, the outside contractor was able to come in, put down his plant on exactly the same ground, and the conditions did not apply, and the Sheffield contractor had therefore not a fair chance, and to equalise matters they considered that a Sheffield contractor who erected his plant and branch office on the same ground should have the same privileges. The employers brought forward the matter, he assured them, not in any carping or arbitrary spirit, but as a matter of sheer necessity which demanded attention.

Mr. J. Biggin said that this matter of walking time was reaching an acute stage all over the country, and in Leeds and Huddersfield, the former of which might be taken as the fairest criterion of the conditions in Sheffield, the rule in regard to walking time was "that the question of walking time, lodgings, and railway fares, be matters for arrangement between employers and their men." What they wanted was something of the same kind at Sheffield, *i.e.*, something which would work amicably between them.

Mr. Evans asked what the masters were prepared to give in lieu of walking time if the operatives agreed to give it up.

Mr. Biggin, in reply, said that the question of lowering wages had been pressed on their notice on several occasions, but they had always objected, and this, he held, was a substantial set-off.

Mr. Wood gathered that the intention of the employers was to do away with walking time altogether, to which

The Chairman replied in the affirmative, but intimated that they were prepared to listen to any argument which could be advanced for the retention of the rules referred to.

Mr. Wood, continuing, said the rule was honoured by age, and he proceeded to trace the alterations in the rule from 1875, when the walking time was fixed for a distance of one mile from the shop through various gradations, entailed by altered conditions, until it arrived at its present stage some six years ago, and arguing from this he asked if it would not be as well to let the rule stand and consider such an extension of radius as the altered conditions seemed to warrant. If they approached their respective societies with a proposal for abolition, they would at once ask what they were to have in return.

Mr. Roper said the masons at Sheffield had not, and did not want, walking time, to which

Mr. Stone replied that he did not wish it to be inferred that the bricklayers were to be ruled by the masons.

Mr. Lane inquired if the Master Builders' Association contemplated any action which would contravene rule 9 in regard to notice of alteration of rules being given, to which

The Chairman replied in the negative.

Mr. Wood assumed that if the operatives did not take some action in the matter as a result of the meeting, the Master Builders' Association would eventually give notice for abolition of the rule in the ordinary way, and on receiving the chairman's reply that this course would most likely be taken, he remarked somewhat nonchalantly that the only argument he could offer at the moment was that they must stick to the rules as they existed.

Mr. Stone quoted an instance in which an outside contractor was not paying walking time, but as a result of their negotiations the contractor eventually paid it, but

Mr. Evans promptly rejoined that the contractor in question was paying 10d. per hour, and they (the Operatives' Society) gave way ½d. per hour. in order to get 10 minutes' walking time.

The Chairman remarked that the Master Builders' Association assisted in the settlement, and eventually the contractor became a member of the association.

Mr. Lane said that for the better facilities for getting to the suburbs, to which the Chairman had referred, the workmen had to pay, but

The Chairman replied that the workmen would avail themselves of the facilities which the trams offered whether they were paid for walking time or not, and as a matter of fact the abolishing of walking time did not affect wages at all: it simply meant that the workmen would receive wages for 10, 15, or 30 minutes' work instead of the same time in walking, and this amount, while small individually, worked out in the aggregate to a sum which put the Sheffield contractor at a great disadvantage with the outside contractor, who could come and put his plant and branch office down on precisely the same ground, and would not be subject to this infliction. He could, therefore, cut out the local contractor, which was mutually to the disadvantage of both the local employer and employee. He wished to assure them that the employers were not attempting to "best" the operatives in any way, but they were forced either to cheapen building costs or lose contracts, and they much preferred the proposal outlined to that of lowering wages. In conclusion the Chairman referred to work on which his firm had been engaged for some considerable time outside the Sheffield boundary, where wages were ½d per hour less, but still they had paid the Sheffield rate, and they had not been asked to pay walking time.

The discussion went on in desultory fashion for nearly three hours, the Chairman incidentally remarking that 75 per cent. of the jobs in Sheffield had been taken latterly at profitless, or practically profitless, prices, while in some cases there must inevitably be a loss.

Eventually the matter resolved itself into what the delegates present could offer to their members in lieu of walking time, but in reply the Chairman said that this matter had not been taken into consideration, as it was felt that the altered conditions of trade demanded the change, and he hoped the delegates present would present the matter to the respective societies in the same frank, fair, and friendly manner in which it had been discussed.

At the request of the delegates present, the secretary was instructed to communicate in writing to the secretary of each society represented the proposal as outlined.

The meeting terminated with a hearty vote of thanks to the Chairman, proposed by Mr. Wood, and seconded by Mr. Biggin.

THE USES OF ADVERTISEMENT.

Mr. Henry Labouchere has a long article in "Truth," on the Territorial Army, in which he pays a well deserved tribute to the "Daily Mail" for the effort they recently made to secure the needful complement of recruits in the London district, and remarks on the value of advertisement in the Press as a means of securing anything that is wanted. He quotes Lord Esher, and says:—

"That he and his colleagues have been criticised and mocked at for appealing for soldiers through the Press, and that to this they remain profoundly indifferent, on the principle that they laugh who win. This is the only sensible view to take. Why on earth anyone should criticise or sneer at an appeal for soldiers through the Press I am at loss to conceive. *It is the simplest and most expeditious way of getting anything you want in these days. Modern conditions of national life demand enterprise aud advertisement.* Every business man knows and recognises this truth, and if our Army is to be run on businesslike lines it must be recognised there, too."

The words we have italicized seem especially applicable to the building trade because there is probably less use made of advertisement by employers in that industry than in other important industry in this country.

Admittedly building trade employers want business badly. Then why not advertise for what is wanted?

Let the building trade convince the public that this is the time to build, that prices are low, and show them that investments in real estate will pay. Let them note that many small buildings will be required in connection with the operation of the Small Holdings Act and lay themselves out to supply the right kind of cheap buildings. Let them keep their names before architects and clients by attractive and pithy advertisements of their qualifications. This is the way to stimulate and foster a revival of their industry.

List of Official Appointments Vacant.

Assistant Overseer and Collector of Rates (Northfield, March 15).—Salary £500.—E. Docker, clerk to the Council, 10, Newhall Street, Birmingham.

Electrical Engineer (Mysore, India, May 15).—Salary Rs. 1,500 (£100) per mensem.—W. McHutchin, secretary to the Government of Mysore Public Works Department, Bangalore.

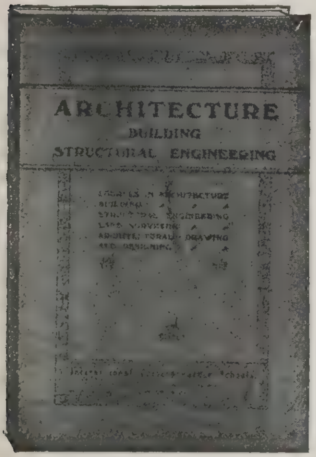
Assistant Surveyor (Woodford, March 20).—Salary £130 per annum.—J. A. Simpson, clerk to the Council, Council Offices, Woodford Green.

FIVE YEARS AGO THESE TWO MEN STARTED LEVEL

—one is still at his bench, toiling hard and long for a slender pittance—the other now occupies a high-grade position in his profession, enjoying high pay, congenial work, influence and power. What is the reason of the present difference in their fortunes? It is not that the successful man has more brains than his "stand-still" colleague of five years ago—**but he does know better how to use them.** In a word, he has **trained** his brains on practical remunerative lines, while the man still at the bench has not.

This instance is just typical of thousands we could cite in which men have devoted a few months to serious home study with the International Correspondence Schools, and, as a direct consequence, have secured a future of success and happiness, while their less ambitious colleagues have condemned themselves to a monotonous continuance of the old round of drudgery.



Free Books on Subjects Below

What about Yourself Five Years from now?

You must be ambitious or you would not have read thus far. Determine then to realise your ambition—to rise out of the rut—by enrolling right away for a course of specialised training with the International Correspondence Schools. Spare time home study only is required. You make the fullest use of your leisure, wasting no time travelling to and from classes. You make every hour you give to study count in your career, for the I.C.S. course arranged for you will have the one and only aim of preparing you for the high grade position to which you aspire.

The evidence of the thousands of students who have benefited by our training during the past 17 years is conclusive on this point. This is how one of them puts it

Aston, Birmingham.

"There is no doubt that yours is in reality 'the system that raises salaries,' that raises a man who doesn't mind work to the highest eminence in his trade."

(Signed) A. H. Du Rose.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Plans, specifications, etc., with the tenant, or with Davidson and Garden, 12, Dee Street, Aberdeen, with whom offers are to be lodged by March 12.

March 13. ABERYSTWYTH.—Erection of a warehouse in Llanbadarn Road, for Mr. Samuel. Plans, etc., at the office of Mr. Llewelyn Samuel, 12, Northgate Street. Tenders to be submitted by March 13.

March 13. BRADFORD.—Execution of alterations and additions to Paddock Dyeworks, Pasture Lane, Clayton, Bradford. Plans, etc., at the office of Sam Spencer, architect, Old Bank Chambers, Great Horton, Bradford. Tenders to be submitted by March 13.

March 13. ASKRIGG, STALLING BUSK.—Erection of a church for the vicar and wardens of Askrigg at Stalling Busk. Plans, etc., at the vicarage, Askrigg, or at Barclay's Bank, at Hawes. Tenders by March 13, to T. Gerard Davidson, M.S.A., 44, Great Russell Street, London, W.C.

March 13. PERTH.—Construction of greenhouses, etc., at Wellshill cemeteries, for the T.C. Plans, specifications, and forms of tender, at office of James W. Bayne, superintendent of cemeteries, Wellshill, Perth. Tenders with John Begg, town clerk, Perth, endorsed "Tender for greenhouses," by March 13.

March 13. WELSHPOOL.—Execution of works at the Welshpool Savings Bank for the trustees. Plans and specifications on application to the secretary, John Evans, 24, Broad Street, Welshpool. Tenders before noon on March 13, to Frank H. Shayler, F.R.I.B.A., architect, Clive Chambers, Shrewsbury.

March 13. CARDIFF.—Conversion of a laundry into a female vagrants' ward at the workhouse, for the guardians of Cardiff Union. Apply to Edwin Seward, F.R.I.B.A., Queen's Chambers, Cardiff, from whom bills of quantities and forms of tender may be obtained on deposit of £2 2s. Tenders to Arthur J. Harris, clerk, union offices, Queen's Chambers, Cardiff, by 10 a.m., on March 13.

March 15. ENNERDALE.—Erection of a churchyard wall at St. Mary's Church, Ennerdale. Particulars from Rev. T. Price, Vicarage, Ennerdale, to whom tenders are to be submitted by March 15.

March 15. EDINBURGH.—Execution of following works for one year from May 15, for the corporation:—Mason, wright, plumber, gasfitter, smith, engineer, painter. Schedules and forms of tender at the office of the city superintendent of works, City Chambers. Offers with the town clerk, City Chambers, by March 15.

March 15. MARGATE.—(1) Tiling the pit with Ostend tiles and carrying out other work at the Oval arena; and (2) building stages for entertainments on the marine terrace sands, for the corporation. Plans and specifications of the borough surveyor, 13, Grosvenor Place, Margate. Tenders by 1 p.m. on March 15, to John E. Saxby, secretary, town hall, Margate.

March 15. SENGHENYDD, NEAR CARDIFF.—Erection of a church at Senghenydd, for the Rev. Lloyd Rees. Plans and specifications, etc., on deposit of £2 2s. Tenders by March 15, to E. M. Bruce Vaughan, F.R.I.B.A., architect, Cardiff.

March 15. YNYSHIR.—Erection of new chapel, vestry, and class-rooms, for the trustees. Plans, etc., at office of R. S. Griffiths, M.S.A., architect and surveyor, Tonypandy, and bill of quantities, etc., on deposit of £1 1s. Tenders to be submitted by March 15.

March 15. PRESTON.—Erection of a wall on the land recently purchased for the extension of the cemetery, for the burial board. Particulars may be obtained at the office of Myres, Veevers, and Myres, 15, Chapel Street, Preston. Tenders to be submitted by March 15.

March 15. COVENTRY.—Erection of buildings for the proposed refuse destructor, Bishopgate Green, for the general works committee of the corporation. Drawings, etc., may be inspected, and bill of quantities, obtained, after payment of £1 1s. to the city treasurer, on application to the office of J. E. Swindlehurst, city engineer and surveyor, St. Mary's Hall, Coventry. Tenders by March 15.

March 16. SHOTTON AND TANFIELD.—Erection of a new council school at Shotton colliery; also alterations and repairs to Tanfield council school, for the Durham C.C. Plans, etc., and bills of quantities at the office of the county education architect, Shire Hall, Durham. Tenders to be submitted by March 16.

March 17. STOCKPORT.—Erection of proposed Primitive Methodist Church and schools, Edgeley, Stockport. Quantities from (Rev.) Wm. Evans, 6, Beauchamp Street, Shaw Heath, Stockport. Estimates by noon on March 17. Further information from Wrathmell and Blackshaw, architects, Queen's Buildings, St. Peter's Square, Stockport.

March 18. DERBY.—Alterations to old slaughterhouses, Sattle Market, for the corporation. Plans, etc., of John Ward, M.Inst.C.E., borough surveyor, Babington Lane, Derby, on deposit of £1 1s. Tenders by noon on March 18, to the town clerk, 15, Tenant Street, Derby.

March 19. CLECKHEATON.—Erection of a secondary and technical school, for the U.D.C. Specifications and bills of quantities, after March 6, on application at the town hall, upon deposit of £1 1s. Plans and details at the office of the architect, W. H. Thorp, Phœnix Chambers, South Parade, Leeds. Tenders, endorsed "Tender for —— Work," by 4 p.m., on March 19, to John H Linfield, clerk to the council, town hall, Cleckheaton.

March 20. STAMFORD.—Erection of a six-roomed cottage at Hudd's Mills, Uffington Road, Stamford, for the corporation. Particulars upon application to the borough engineer, town hall, on deposit of 10s. Tenders by March 20, to Fredk. R. Ryman, A.M.Inst.C.E., borough engineer, town hall, Stamford. Local builders invited to tender.

March 22. CARRICKFERGUS.—Erection of a building, High Street, Carrickfergus. Plans and specifications at the offices of the architects. Tenders by 4 p.m., on March 22, to Samuel P. Close and Son, architects, 13, Donegall Square North, Belfast.

March 22. SLEAFORD.—Alterations and additions to the Wesleyan Church premises, Sleaford, for the trustees. Plans at the Wesleyan Church, Sleaford. Tenders to the Rev. E. Jope, Sleaford, by five p.m., on March 22nd. Quantities of A. E. Lambert, architect, 22, Park Row, Nottingham, on deposit of £1.

March 23. ISLINGTON.—Extension of stables and repairs to the roof at the depot, Liverpool Road, N., for the corporation. Drawings and specification, etc., on and after the 16th inst., upon application to the borough engineer, J. Patten Barber, town hall, Upper Street, N., and deposit of £2 2s. Tenders to Wm. F. Dewey, town clerk, town hall, Upper Street, N., by 4 p.m. on March 23.

March 23. LONDON.—(1) Execution of repairs and minor works in connection with fire brigade stations, offices, stores, and other buildings belonging to the L.C.C.; (2) erection of hoarding, shoring, fans, fencing, notice boards, etc., for the L.C.C. Full particulars in the "London County Council Gazette," March 8, to be obtained from P. S. King and Sons, 2 and 4, Great Smith Street, Westminster, S.W. Forms for (1) from the architect measuring surveyor's section, 19, Charing Cross Road, W.C.; and (2) from the valuer, 9, Spring Gardens, S.W., upon deposit with the cashier of £2 2s. and £1 respectively. Tenders to G. L. Gomme, clerk of the L.C.C., County Hall, Spring Gardens, S.W., by 11 a.m. on March 23.

March 24. HULL.—Construction in reinforced concrete of a swimming pond, 90ft. by 35ft., together with sub-structure of main building, 109ft. by 76ft., including foundations, floors, gallery, and main walls to gallery level, for the corporation. Forms of tender, etc., of A. E. White, M.Inst.C.E., city engineer, town hall, on deposit of £1. Prints of contract plans on payment of 5s., not returnable. Remittances to T. G. Milner, city treasurer. Tenders to the chairman of the baths sub-committee, at the town clerk's office, by March 24.

March 26. DENNY.—Construction of new station buildings at Denny, for the Caledonian Railway Company. Drawings at the office of the company's engineer, Buchanan Street station, Glasgow. Specification and schedule on deposit of £2 2s. Tenders by March 26, to J. Blackburn, secretary, Caledonian Railway Company's Offices, 302, Buchanan Street, Glasgow.

March 27. GOLBORNE, NEAR WIGAN.—Alterations and additions at Parkside Mill School, Golborne, for the Lancashire education committee. Plans, etc., at the office of the county architect, on deposit of £2. Tenders before noon, on March 27, to Henry Littler, county architect, 16, Ribblesdale Place, Preston.

ENGINEERING.

March 15. MARPLE.—Supplying one set of three-throw horizontal ram pumps, to deliver 6,000 gallons per hour against a working pressure of 130lb. per square inch, delivered and fixed at the station, Norbury, for the U.D.C. Complete specification of pumps offered required; also inclusive price for fixing. Tenders to the chairman of the council, public offices, Market Street, Marple, before 4 p.m. on March 15. Further particulars from D. J. Diver, the council's surveyor, public offices, Marple.

March 22. MILTON, LYMINGTON.—Erection of a ferro-concrete bridge over the stream at Fernhill, in the parish of Milton, for the R.D.C. Particulars of S. Crittall, surveyor, Sway. Tenders by March 22, to J. Davis Rawlins, clerk, 38, High Street, Lymington.

March 23. HANDFORTH, CHESHIRE.—Supplying and fixing a Cornish boiler at the Styal Cottage Homes, Handforth, Cheshire, for the guardians of the poor of Chorlton union. Specifications from the Manchester Steam Users' Association, 9, Mount Street, Albert Square, Manchester. Tenders by March 23, to David S. Bloomfield, clerk to the guardians, union offices, All Saints', Manchester.

IRON AND STEEL.

March 13. CARDIFF.—Providing and fixing iron railings, etc., at the hospital, headquarters homes, Ely, for the Cardiff union. Specification, with form of tender, of the clerk. Tender, with specification attached, by 10 a.m., on March 13, to Arthur J. Harris, clerk, union offices, Queen's Chambers, Cardiff.

March 15. HINDLEY.—Supplying the following for the year ending March 31, 1910, for the U.D.C.:—1, wrought iron tubes and fittings; 2, gas meters; 3, gas fittings; 4, water fittings; 5, lead, gas, and water pipes; 6, gas main cocks; 7, sulphuric acid. Forms of tender of H. O. Timmins, engineer, gas works. Tenders to T. Robey, clerk to the council, by March 15.

March 15. BURSLEM.—Supplying about 300 lineal yards of wrought iron unclimbable fencing, 5ft. 6ins. high, and about 60 lineal yards of wrought iron palisade fencing, 2ft. 6ins. high, with 4 pairs of wrought iron entrance gates, for the Corporation. Particulars F. Bettany, borough engineer and surveyor, municipal offices. Tenders to A. Ellis, town clerk, town hall, by March 15; fair wages clause.

March 16. LONDON (FOR MADRAS).—Supplying wrought iron (angles, flats, rounds, squares, sheets, and plates), as specification, at the offices of the company. Tenders by noon on March 16, to H. Bonham-Carter, secretary, 91, York Street, Westminster, S.W. £1 1s. for specification (not returnable).

PAINTING.

March 11. WALSALL.—Painting portions of the workhouse buildings, for the guardians. Specification to be seen on application to the master of the workhouse. Tenders to be submitted by March 12.

March 12. GRAVESEND.—Painting and redecorating the interior of the market, for the town council. Specification at the borough surveyor's office, town hall, Gravesend. Tenders to be submitted by March 12.

March 13. CARDIFF.—Execution of internal colouring, painting, and papering, at the Ely workhouse, for the Cardiff union. Specification, with form of tender, of the clerk. Tender, with specification attached, by 10 a.m., March 13, to Arthur J. Harris, clerk, union offices, Queen's chambers, Cardiff.

March 15. GOSFORTH.—Painting work for the committee of visitors of the Newcastle-upon-Tyne city lunatic asylum, Gosforth. Form of tender on application to the clerk of the asylum. Tenders to be submitted by March 15.

March 15. PEMBERTON.—Cleaning, painting, and decorating the Carnegie Library, Pemberton, for the Wigan Corporation. Particulars at the office of the borough engineer, King Street West, Wigan. Tenders by March 15, to Harold Jevons, town clerk, Municipal Offices, King Street West, Wigan.

March 15. DUBLIN.—Cleaning, painting, etc., the roof of Amiens Street terminus, for the Great Northern Railway Company (Ireland). Apply to W. H. Mills, engineer-in-chief, Amiens Street terminus, Dublin. Tenders by 10 a.m., on March 15, to T. Morrison, secretary, secretary's office, Amiens Street terminus.

March 23. LONDON.—Cleansing and re-painting Westminster Bridge, for the L.C.C. Particulars on application to the chief engineer, Maurice Fitzmaurice, C.M.G., County Hall, Spring Gardens, S.W., and deposit of £1. Tenders by 11 a.m. on March 23 to G. L. Gomme, clerk to the L.C.C., County Hall, Spring Gardens, S.W.; fair wages clause.

PLUMBING & SANITARY

March 12. TROWBRIDGE.—Erection of a urinal, also extension of water main and fixing hydrants, etc., in the cattle market, for the U.D.C. Plans and specifications of H. G. Nicholson-Lailey, town surveyor, town hall. Tenders to the chairman of the market committee, at the office of the surveyor, by March 12.

March 15. BARNSLEY.—Laying a 2 and 3-inch cast-iron water service pipe line from near Notton station, Great Central Railway, to Notton village, for the R.D.C. Plans and specifications and bill of quantities at the offices of Crawshaw and Wilkinson, surveyors, 13, Regent Street, Barnsley, to whom tenders are to be submitted by 4 p.m., on March 15.

March 17. KIRKCALDY, FIFE.—Supplying and laying about 3,200 lineal yards of fireclay sewer pipes of 9, 10, and 12 inches diameter, and construction of manholes, at Windygates and Balcurvie, for the Kirkcaldy District Committee of the Fife C.C. Apply to William Lockhart, C.E., 220, High Street, Kirkcaldy. Tenders with Alexander and David Beveridge, joint district clerks, 220, High Street, Kirkcaldy, by March 17; £1 deposit.

March 24. BRAINTREE, ESSEX.—Construction of sewerage and sewage disposal works for the U.D.C. Plans at the office of the engineers, Sands and Walker, Milton Chambers, Nottingham, and conditions, specification, and quantities, on deposit of £3 3s. Tenders by 10 a.m. on March 24, to Herbert J. Cunnington, clerk to the council, Braintree, Essex.

March 27. ASHBORNE (DERBYSHIRE).—Construction of new stoneware and iron pipe sewers, dortmund and septic tanks, filter beds, etc., for the U.D.C. Plans of the engineer, W. H. Radford, C.E., Albion Chambers, King Street, Nottingham, on deposit of £3 3s. Plans, specifications, and quantities also at the surveyor's office, town hall, Ashborne. Tenders by March 27, to R. Williams, clerk to the council, council offices, Ashborne.

ROADS AND CARTAGE.

March 12. STAPLEFORD.—Completion of Horace Avenue and Church Lane, for the R.D.C. Plans and specifications at the office of F. R. Hanley, surveyor of the council, Wood Street, Ilkeston. Tenders by March 12, to Frederick Wm. Fox, clerk to the council, 11, Park Row, Nottingham.

March 15. SPENNYMOOR.—Supplying road metal for the year ending March 31, 1910, for the U.D.C. Particulars and forms of tender of C. R. Spencer, surveyor, council offices, Spennymoor. Tenders by March 15, to F. Badcock, clerk to the council, council offices, Spennymoor.

March 15. STEYNING (SUSSEX).—Supplying flints before October 1, for the R.D.C. Forms of tender of the clerk, or of the surveyor of the council, F. Slaughter, High Street, Steyning. Tenders by March 15, to Arthur Flowers, solicitor and clerk to the council, union offices, New Shoreham.

March 15. ASTON-CUM-AUGHTON.—Levelling, metalling, kerbing, channelling, and making-up Park Street, at Swallownest, in the parish of Astom-cum-Aughton, for the Rotherham R.D.C. Particulars of B. Hey, surveyor of the council, Imperial Buildings, Rotherham. Tenders by 5 p.m., on March 15, to Oxley and Coward, clerks to the council, 6, Westgate, Rotherham.

March 15. CHESTER-LE-STREET.—Supplying (1) whinstone, limestone, and blast-furnace slag; (2) carting same from various stations on to the roads, for the year ending March 31, 1910. Apply to Geo. W. Ayton, highway surveyor, Chester-le-Street, to whom samples, showing quality and size, are to be sent. Tenders to the surveyor's office by first post on March 15.

March 15. PLYMOUTH.—Making-up and completing the following streets and lanes, for the corporation:—(1) Neath Road, section 3; (2) Rowden Street; (3) Carmarthen Road, section 1; (4) Oxford Avenue Lane North; (5) Short Park Road Lane South. Plans and specifications, etc., of James Paton, borough engineer, municipal offices, Plymouth, to whom submit tenders by 5 p.m., on March 15.

March 16. THURNSCOE.—Supplying materials for the year ending March 31, 1910, for the U.D.C., broken granite, granite chippins, rough dross, hand-broken dross, dross screenings, flags, kerbs, setts, channelling, asphalte, pipes, etc. Forms of tender from the clerk. Tenders, endorsed "Materials," by March 16, to J. Ledger Hawksworth, clerk, Bolton-upon-Dearne, Rotherham. Samples to the surveyor, R. Higginbottom, Thurnscoe.

March 27. GATESHEAD.—Supplying the following materials for one year, for the corporation: Whinstone macadam, granite macadam, whin setts, whin curb, whin channel, whin wheelers, limestone macadam, freestone curb and flags, metal gullies, manhole covers, etc., shovels, picks, scavenging brooms, lime and cement. Specifications, etc., of N. P. Pattinson, borough surveyor, town hall. Tenders by noon, on March 27, to W. Swinburne, town clerk.

MISCELLANEOUS.

March 13. CARDIFF.—Supply of joiners' fittings for laundry at Cardiff workhouse, for the guardians of Cardiff union. Plans and specification by Edwin Seward, F.R.I.B.A., Queen's Chambers, Cardiff. Forms of tender of the architect. Tenders to Arthur J. Harris, clerk, union offices, Queen's Chambers, Cardiff, by 10 a.m., on March 13.

March 16. LONDON.—Supply and erection of open pale oak fencing at Ruskin Park, Denmark Hill, S.E., for the L.C.C. Drawing and specification, forms of tender, and other particulars at the Parks Department, 11, Regent Street, S.W. Tenders to the clerk of the L.C.C., Spring Gardens, S.W., by 11 a.m., on March 16. Fair wages clause.

March 19. LONDON.—Taking up and relaying new floor in nurses' home, Raine Street, E., for the parish of St. George-in-the-East. Apply to R. Murray Lochner, clerk, Raine Street, Old Gravel Lane, E., to whom submit tenders by 2 p.m., on March 19.

Fair Wages Clause in Government Contracts. The debate on March 10th in the House of Commons on this question resulted in Mr. Hodge's motion, with which we dealt in our last issue, being amended; Mr. Sydney Buxton, Postmaster-General, on behalf of the Government, proposing the following: "That, in the opinion of this House, the Fair Wages Clause in Government contracts should be so amended as to provide as follows; the contractor shall, under the penalty of a fine or otherwise, pay rates of wages and observe hours of labour not less favourable than those commonly recognised by employers and trade societies (or in the absence of such recognised wages and hours, those which in practice prevail amongst good employers) in the trade in the district where the work is carried out. Where there are no such wages and hours recognised or prevailing in the district, those recognised or prevailing in the nearest district in which the general industrial circumstances are similar shall be adopted. Further, the conditions of employment generally accepted in the district in the trade concerned shall be taken into account in considering how far the terms of the Fair Wages Clauses are being observed. The contractor shall be prohibited from transferring or assigning, directly or indirectly, to any person or persons whatever, any portion of his contract without the written permission of the department. Sub-letting, other than that which may be customary in the trade concerned, shall be prohibited. The contractor shall be responsible for the observance of the Fair Wages Clauses by the sub-contractor." Mr. Buxton, in the course of his remarks, said: "In this matter there was no attack on capital or employers, on the contrary it was intended to support the position of good employers of labour, who found it profitable to employ good labour, to work reasonable hours and to pay good wages. It appeared to be the best step that could be taken in the interests of capital." He further said, "the cases of evasion were comparatively few, while some £25,000,000 a year was spent in Government contracts, the number of complaints only amounted to a score or so during the year." Under these circumstances, one wonders why any amendment of the existing clause is considered necessary. Mr. Buxton, however, considers that "the time has come when a more satisfactory wording is required, to limit the area of dispute, to secure greater uniformity of practice and greater promptitude." He then dealt with the defects of Mr. Hodge's proposal much in the sense of our article of last week and on the lines of the Departmental Committee's report, and claimed that his proposal obviated those defects. The Labour representatives very frankly accepted the views expressed by the Postmaster-General, and the resolution, as amended by him, was agreed to.

Builders' Liabilities. Among the law cases reported this week and last, there are two that are of special importance to contractors. One is an action for damages for serious injuries received by a boy who was playing near a building that was in course of demolition, and the other is a question of the enforcement of by-laws as to hoardings. In the first case, the contractors have to pay £130 damages. Whether or not they are insured against such contingencies we are unaware; but, at any rate, the event shows the extreme importance to contractors of covering their liabilities to the utmost extent possible. The case shows conclusively that it is not sufficient to insure against accidents to workmen. Contractors are further liable for accidents that may occur to the outside public, and, as the case in question proves very clearly, and, indeed, as contractors should be very well aware, such contingencies are by no means remote. There is no need to labour the obvious moral. Contractors cannot afford to "trust to luck" in such matters, and they will be wise if they avail themselves of the fullest facilities for insurance against every form of accident for which at any moment they may be held to be liable. In this respect their Federation will, we are assured, afford them all possible help. The by-laws case was dealt with last week. Here it will suffice to remark, without special reference to this particular case, that the value of organisation can be hardly better illustrated than in united protest against the arbitrary enforcement of ill-considered by-laws which act in restraint of trade.

Soot and Suggestion. Mr. Martin Harvey, the well-known actor, has made a suggestion to the Liverpool "Daily Post" that St. George's Hall should be thoroughly scrubbed, and pleads that the work be given to "a long line of workless men, humbly waiting to be kept alive by a little soup, served out to them from a perambulating kitchen," which incidentally came into his view "of one of the noblest buildings I have ever looked upon." It is refreshing to find a leader in one art taking so active an interest in a masterpiece of another art; and from the windows of his hotel Mr. Harvey seems to have detected at one and the same time a defect in this masterpiece, and the means to hand for its remedy. "Could not these men," he says, "be given pail, water and brush, and set to scrub the hall? Scaffolding and swinging platforms are not impossible; and what delight it would give the inhabitants of this great port to view the cherished building in all its pristine beauty." All it would mean is a penny rate; but we doubt if the Liverpudlian ratepayers will so joyfully rise to the occasion as Mr. Harvey presupposes. It may be the only way to recover the pristine beauty of the building; but we are doubtful if the effect aimed at is quite likely to commend itself to architects in general. But there is much truth in Mr. Harvey's contention that the only beauty of this great pile now visible is the skyline. "All the detail of frieze, capital, surface, light and shade, and framed sculpture is obscured by a coating of soot and grime." We have often pointed out how damage to the delicate mouldings and carvings on our public buildings results from allowing this accumulation of soot to remain and act as a sponge, absorbing the acid products of the atmosphere to work on the surface of the stone. If all these accumulations that clog the detail of this great bulding were removed, Mr. Harvey would no doubt waive his demand for the future restoration of its pristine beauty. We can assure him that the result would not be so beautiful as possibly he imagines.

Labels and Lamp-posts. The town-planning movement is probably responsible—innocently and indirectly—for the very interesting crop of parasitic propositions that are springing up on or about the grand trunk scheme. Such fungi are easily and promptly destroyed. There was, for instance, the brilliant suggestion, made in the House of Commons, to compel owners of slum property to affix plates bearing their names to the houses they owned. The idea was lightly brushed into nothingness by the President of the Local Government Board, who expressed the hope that his Town-Planning Bill would render such labels superfluous by abolishing the slums. The physically similar but spiritually very different proposal to label public buildings with an indication of their identity and with the name of the architect and the date of erection is still being mooted in the newspapers, to the perplexity of such architects as consider themselves to be concerned in it; for they are in a strait betwixt the desire for fame and the apprehension of disfigurement to the buildings; while the extremist refers rather contemptuously to the superfluity of all labels whatsoever, considering that the purpose of a building should be expressed in the design. This stern pedant would probably be at no loss if asked to provide the general public with some purely architectural means of discriminating between the Red Tape Department and the Circumlocution Office! Then, again, there has been a recent resuscitation of the proposal to turn street lamps to the sweet uses of advertisement. The borough councils to whom the application was made have rejected it with fine scorn. They have the grace to perceive that our streets are sufficiently hideous without such addenda; but they carry their scrupulosity to the verge of prudishness by steadfastly refraining from putting the lamps to what is surely a very legitimate use. "Heaven's Light our Guide" is no doubt a splendid motto for the Empire; but when it comes to the heroic endeavour to find a London address after nightfall, a little lamplight on the subject would be of inestimable service. In the suburbs, especially, where policemen and postmen are scarce, the search for a given house or a given street is quite a speculative adventure, from which thousands of persons of only average perseverance nightly retire baffled and discomfited. If we must have luminous labels, let them not be puffs of pills and potions, but a plain indication of where we stand. The refinement of this idea by some enthusiastic astronomer, who wants the lampposts to give us latitude, longitude, the time of day, the temperature and a weather forecast, is perhaps too ambitious; and the abolition of street names—which is again advocated in to-day's newspapers—in favour of the American system of numbers seems to find but little favour with "the man in the street," who has, perhaps, a better memory for names than for numbers, and who may be supposed to cherish a certain degree of sentimental regard for the old labels. But the labels should be conspicuous by night as well as by day. The thoughtful promoters of the Daylight Saving Bill may, when they are tired of playing with the clock, turn their attention to the hard case of the man in a dim and labyrinthine suburb trying to find, with the aid of a box of matches in a gale of wind, the particular number he wants of the 632,591 houses comprised in the administrative county of London. Nothing short of an Imperial Act will secure this much-needed reform; which, however, should not be carried out on strictly utilitarian lines. There should be some provision against the blighting influence of such street labels as are at present too common. An ugly label may kill the effect of a streetful of decent houses. The label should be at least inoffensive. Perhaps it is too much to claim that it ought to be artistic, although it might certainly be that without being either expensive or illegible.

"The Glorified Glasshouse." Architects will view with mixed feelings the endeavour to save the Crystal Palace. Many regard it as a monstrosity that we should be well rid of; others take the milder view that, as an example of daring and ingenious construction, it is worth preserving. At the influential meeting held at the Mansion House the other day, it was unanimously resolved that the great glasshouse ought to be "vested in the public and dedicated to their use for ever," but this decision obviously bore very little relation to the æsthetic point of view. What the representatives of the metropolitan borough councils and other authorities had chiefly in mind was the value of the Palace as a recreative and an educational institution; and, in particular, it was recalled that the Fine Art Courts show in chronological sequence the various phases through which architecture, sculpture, and mural decoration have passed during a period of more than 3,000 years, from the remote ages of Egyptian civilisation down to the sixteenth century; also that it houses excellent schools of engineering, and of art, music and literature; the art classes being remarkably well equipped. When, in 1851, Paxton's design for the Great Exhibition in Hyde Park was chosen, great was the disgust of architects; and when, in the following year, the building was re-erected at Sydenham, they protested against the perpetuation of the freak; and it is only by an effort that one can shake off the natural prejudice against the "glorified greenhouse;" of which the main building is rather more than 1,600ft. long, 390ft. wide, and 175ft. high, while the perhaps too familiar towers are 280ft. high. The cost of re-erection was £1,500,000; and the substitution of a building of less "questionable shape" seems, on this consideration, as well as on sentimental grounds—for the average Londoner will never admit that the gigantic conservatory is a blot on the landscape — to be quite out of the question. But the demolition of the Palace, and the obliteration of its 200 acres of open space is an alternative from which the most ardent speculative builder would shrink.

Over-Elaboration. Mr. Temple Moore, F.R.I.B.A., lecturing to the Sheffield Society of Architects and Surveyors on "The Use of the Gothic Styles in Modern Architecture," protested against the current tendency towards over-elaboration of detail. The niches and panelling, for instance, in the Houses of Parliament, though often excellent in design, are wearisome by excessive repetition. Nor is this fault peculiar to Gothic work. In moden Pallidian buildings the designer is apt to run riot with rustication and blocking of columns, oblivious of the dignity of simple wall surfaces and plain columns. Mr. Temple Moore, of course, by no means stands alone in these opinions. It is a commonplace of criticism that the blocking of columns is being greatly overdone, and one exponent of the vernacular (in language if not in architecture) has profanely impugned it as "the bolt-and-nut style." Mr. Temple Moore's more dignified protest is timely and welcome, and should make for restraint with regard to this too familiar feature of brand-new buildings; and as to rustication, it may be further urged that, for the buildings of great cities, it is rather an ill-considered style of dressing, because, to the thoughtful gaze, it suggests infinite possibilities in the harbouring of soot and mud and microbes, and the utter hopelessness of dislodging these undesirables. Rusticated masonry need not be utterly abolished; but, for hygienic considerations, it should be—rusticated, in a still stronger sense than that in which the term is understood at the universities.

Notes and News.

The second annual general meeting of the National Association of Master Monumental Masons and Sculptors, of 2, Clements Inn, London, W.C., will be held at Anderton's Hotel, Fleet Street, on Monday, March 29th, commencing with luncheon at 12 noon (the executive committee meeting at 11 a.m.). Meeting open to members only, commencing at 1 p.m., and a further meeting, open to members of the trade upon production of the trade cards, at 5 p.m., when matters of general interest will be discussed.

* * *

At a meeting of Orsett Rural Council, Mr. Hill-Willis reported, with reference to the amendment of by-laws to facilitate the use of concrete, that in his opinion the Council could with advantage adopt the amendments provided they insisted on ordinary external walls of domestic buildings being built with a cavity in the centre to make the wall damp-proof and equable in temperature; also that where the walls were less than 9ins. thick a suitable reinforcement be provided. The Clerk stated that a letter had been received from the Local Government Board with reference to the Council's application as to amending the by-laws to facilitate the use of concrete. It was proposed to refer the letter to a committee.

* * *

In the House of Commons on Wednesday last, Mr. Gladstone, repying to Mr. Fell (U.), stated that 420 quarries had been closed in the United Kingdom since 1905. They were distributed as follows: England 227, Scotland 100, Wales 33, Ireland 60. No doubt several of these quarries were worked out before they were closed. The decrease in the number of persons employed in quarries between 1905 and 1907 was 7,005, distributed as follows: England 2,543, Scotland 2,150, Wales 1,685, Ireland 627. It did not follow that all these men were thrown out of employment. The decrease was probably due in great part to the use in buildings of ferro-concrete and other substitutes for stone, a change which, while it led to a diminution of the numbers employed in quarries, involved an equal or greater increase of employment in other directions. The great majority of the men who had ceased to be employed were engaged in sandstone, limestone, or slate quarries.

ROYAL ACADEMY EXHIBITION, 1909.

The day for sending in architectural drawings to Burlington House is Friday, March 26th, from 7 a.m. to 10 p.m. As in past years we shall be happy to act as agents for delivering drawings to the Academy on the condition that we are allowed to reproduce any of the designs passing through our hands prior to their being sent in. We should appreciate the kindness of architects in forwarding their drawings as early as possible, and would mention that we can obtain more satisfactory results in the reproduction when we have plenty of time at our disposal.

Drawings for exhibition in the architectural room should be glazed and should have gold frames. Each frame must have a ticket pasted on the back, giving the number, title of the work, and the architect's name and address, to correspond with the particulars given on the printed forms, which must be obtained from the secretary at the Royal Academy, Burlington House, Piccadilly, W., and there should be attached to each frame, by string, a printed label (also supplied by the Academy) so arranged that it may hang over the front of the drawing. The printed form of advice should in all cases be forwarded to us to hand to the secretary on delivery of the drawings. No exhibitor may send more than three works, and we should recommend intending exhibitors to avoid wide margins or mounts to the drawings, as space is a considerable factor in the arranging of the architectural exhibits.

IDEAS IN THINGS.

Mr. Voysey was the lecturer at the Carpenters' Hall on Wednesday evening, 24th February, and at the commencement of his lecture said that he regarded the presence of his audience as expressive of a desire to improve something; to do some good to somebody, and this he took to be a healthy sign. This age we live in, he said, is intensely material. The steam engine and electricity have transformed the world, and our minds have been so taken up by material ideas that we have scarcely paid that attention to our spiritual nature which that part deserves. Our nature has always been twofold, viz., material and spiritual, and we must recognise the difference between thoughts and feelings which affect our hearts, and thoughts and feelings which affect our bodies. It is necessary also to draw a distinction between associated ideas and intrinsic ideas, the latter of which are always the more stable. Associated ideas may change, but intrinsic ideas never. A technical knowledge of any craft is but a language with which to express thought and feeling. We may, he said, make doors and windows, chairs and tables with mechanical exactness, but we shall obtain no spiritual benefit from our labour unless we put our hearts and minds into our work. The influence of a workman, through his productions, may be vain and frivolous, or dignified and full of restraint, according to his spiritual nature. The front of Rheims Cathedral was shown, and the lecturer drew attention to the way the subject-matter governed the whole work of the carvers. They had it in their heart, and told it as directly as they could, through their material. I believe, he said, that the old carvers obtained more enjoyment from their work than we do from ours, because they read less and thought more. Differences in the material condition of men have existed ever since the world began, but let us be sure that we all respond to the same virtues, love, self-sacrifice, simplicity, and truthfulness, for by so doing we have a common bond of union. The delight of expressing thoughts and feelings which arouse pleasure in others is in all of us. All we require is the power of discriminating between noble thoughts and feelings, and those that are baser. What are our schools doing to-day in this direction? Many of them, while telling us of the beautiful work done in past ages, deny that such work is possible in these dark ages. "We are all miserable sinners," they say, "and we must go on our hands and knees, and measure up and draw like parrots to imitate the work of the ancients." This, he said, was false teaching. Men can turn out to-day work as perfect in material qualities as in the past. We are far too keen on mechanical perfection, and in our materialism we have run after the perfection of the machine, and preferred it to the perfection of the human heart. You have all, he remarked, observed the soft effect of the outline of an old building when the angles were put up by eye, compared with the hard mechanical effect of the modern drafted angle. We must give up the sham of pretending to be Greeks and Romans in our architecture, and if we have no noble ideas, let us hide our heads in the sand until we get some. Reverence for Nature is a fruitful source of beauty. If our work is to be fit and beautiful it must express some healthy emotion. We make a great mistake in giving all our attention to men's work; it would be far better for us to watch the ways of Providence. When we are asked to design anything, we immediately look to see how someone else has done it. Our museums are crowded with examples, and there is every inducement to us to use the wits of others rather than our own. I am convinced, he said, that if we paid more attention to spiritual matters we should regard ugliness as a form of sin, and so should never look twice at it. Lavish ornament is like a drug, the dose requires increasing as it loses its effect. Speaking of the value of colour, he asked how could we get help from Nature in the matter of colour? She furnishes us with an abundance of the most soothing colour, namely, green; but red she uses very sparingly. In the spring she gives us delicate greens, blues, greys, etc., later on these are strengthened under the summer sun; then, when our eyes are tiring, come the oranges and browns of autumn. Nature never allows her colours to quarrel, the most brilliant colours are always in relatively small quantities, and it is the relative quantities of colour that make for harmony. The door, he said, may be a joy, and may express welcome and dignity, it may soothe or vex you. You may pass through it with pleasure or in pain. But the point to be considered is: Has the maker gained by his labour? Has he enriched his own character, and those also who observe his work? If we lived in a less material state of mind we should pay more attention to the observation of each other's work. He deprecated much of the so-called ornamental enrichments applied to our architecture in towns. We cannot, he said, be too simple. A true desire to be simple strengthens our sense of fitness. The carving of richly veined marbles and figured woods was an act of irreverence and conceit. Most of our houses, he said, resemble storms, and how few stand peacefully and in repose. They look more like spectres, and are composed of an infinite variety of shapes as well as an infinite number of differently coloured textures and materials. What, he asked, has the intimate knowledge of the history of Greece and Rome done for us? It has made us vain, not thoughtful; arrogant but not emotional. Let us say that we are at the end of a hideous night, for all around us are signs of spiritual activity and a reaction from materialism. In conclusion, several beautiful slides were shown, chiefly of the sculpture in various parts of Rheims Cathedral, the lecturer drawing special attention to the way the figures told their own story, this carving being the literature of the time.

Mr. Voysey delivered the second part of his lecture, entitled "Ideas in Things," at the Carpenters' Hall, London Wall, E.C., on Wednesday evening, March 3rd.

This evening, he said, I want you all to fancy you are architects, and commissioned to build me a home. We have only £3,000 to spend on land and buildings. We must be in easy reach of a railway, with constant thought of economy of time and money. We have a site with trees on undulating ground. There is a fine view to the north-west, and the main road also is on that side. Will it not then be better to capture the early morning sun than so to place our rooms as to keep the beautiful view? We have then fixed a south-east aspect, and our prospect will be best from the hall, staircase, or corridors on the north-western side. Our next thought should be the position of the house, and we must take care to show reverence for the trees, and for the levels of our ground. For the sake of sympathy and repose, we will choose the most level part. A straight drive to the house from the road will express decision and determination, avoiding any wobbling, which only denotes weakness. Economy will keep us near the entrance boundary. The en-

HOUSE IN THE CLEVELAND DISTRICT, YORKSHIRE: VIEW FROM ENTRANCE GATE.
JAMES FORBES ARCHITECT.

trance should be prominent, overlooking all the area on the roadside of the house. We should try to make our building subdued and restful, hiding behind the trees, not towering above them and looking down on them with scorn. A jagged angular outline against the sky, a mass of chimney stacks, and complicated roofs are often caused through want of thought. Our symplicity will result in economy of material and labour, and may leave a little spare cash for a spot of sculpture. You will gather your flues together and arrange your rooms in a way which will enable you to cover them with one roof, or as few roofs as possible. The wide door suggests welcome, but more than sufficient height suggests magnificence, and would only lead to disappointment if the rooms, for economy, are low. If the money at our disposal will not allow us to use oak joinery everywhere, let us use it nowhere. One little jewel-like spot of stained glass would be better than a quantity of material more costly than that used throughout the building. My architect must give me ventilation, and a system by which the air in my rooms is kept moving, and thus avoid draughts. Low rooms will help us greatly, and give us the benefit of reflected light. Our by-laws, in most districts, will not allow us to build rooms of good proportion. Small windows, with white ceilings and friezes, will not only produce light rooms, but preserve an equable temperature through the year. We like on entering a house to see our wants anticipated. A lavatory should be provided for coats and hats, boots, etc., to avoid mud being taken upstairs. It is desirable so to plan the house that the servants shall enjoy the same freedom to be merry as I enjoy myself. My noise should be shut off from them and theirs from me. The sitting and dining-rooms may be likened to human heads. The door is the mouth through which many good things pass, the windows are the eyes, and the fireplace is the heart, or the countenance of the whole face. You will so proportion my fireplace that there shall be ample room for all to gather round. Will you help me to respect local conditions of climate and soil, and ignore facilities of transit, using as far as possible material to harmonise with local character in colour and texture? In my rooms, the lecturer proceeded, I ask for no cornices, which produce shade; and no ornament on my ceilings, which I can only see by paining my neck. I want no finger-plates, because they suggest that I keep dirty fingers in my house. In arranging the furniture of my rooms, you will see that each piece has the place most suited to its use. If you give me one or two pieces in each room, such as pictures and sculpture, they will be infinitely more impressive than when in a crowd. I would rather delight you with the contemplation of one object, than bore you with a museum full, however beautiful they might be. Remember the machine that will probably assist in the making, and so let right proportions, the natural quality of your wood, and the colour and texture of the upholstery be everything. Enough has been said to lead you to introduce ornament, i.e., machine-made mouldings, etc., only when it is needed on practical grounds—for example, the moulding of a skirting board, to avoid a ledge for dust. The effect of meaningless elaboration is called richness by some. Real richness is only obtained by the use of precious materials, concentrated and harmoniously arranged. In arranging my guest chamber, would it not charm my visitor more to find all his wants anticipated, rather than find his room a reproduction of the bed-chamber of a foreign potentate? In olden days, the four-post bedstead suggested protection; but since then the sanitary expert has come along to persuade us that we want more fresh air than our forefathers, and iron and brass bedsteads were introduced with their glitter and tawdry effect. As to floor coverings, we must remember that the floors are backgrounds, and so the pattern should not interfere with the objects seen against it. If then in building for me you find so many conditions and feelings to be thought of and served, so in all for whom you work. In lighting, he said, although we all want abundance of light for work or play, yet we do not want windows that have to be covered up by upholstery both by day and night. In conclusion, Mr. Voysey gave his "architects" these instructions: Think of the needs of the spirit more than the needs of the flesh. Then, and only then, shall we have really good architecture, really good carpentry, and really good work of any kind.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Mar. 24.	*HALL AT EASTLEIGH, HANTS, to be erected adjoining the Railway Institute for the L.S.W. Railway Co. Particulars and site plan from the Secretary, L.S.W.R., Waterloo Station, London, S.E. Deposit £1 1s. Designs to be sent in at 10 a.m. on date given.
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days.
April 10.	BOLTON BRANCH PUBLIC LIBRARIES. The Libraries Committee of the Corporation invite competitive plans from architects who have been principals in the County Borough of Bolton six months prior to the present date for Branch Public Libraries to be erected in the districts of Astley Bridge, Halliwell, and Gt. Lever. The plans and particulars may be obtained from Samuel Parker, Town Clerk, Town Hall, Bolton. Deposit, two guineas.
April 12.	ELLAND NEW SECONDARY SCHOOL. Architects having offices and practising in the West Riding of Yorkshire are invited to compete for the work in connection with the new Secondary School at Elland, and should apply for particulars to Mr. Leonard Clegg, Holiwell Green, near Halifax.
July 31.	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50. and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	BOURNEMOUTH BRANCH PUBLIC LIBRARY. Architects practising in the County Borough of Bournemouth are invited to submit designs for a new Branch Library at Boscombe. Particulars from Charles Riddle, Borough Librarian, Central Library, Bournemouth.

* The Secretary of the R.I.B.A. requests members to communicate with him before completing their designs in this competition. The conditions are under the consideration of the Council.

Our Plate.

The measured drawing, by Mr. W. J. Walker Todd, shows the chapel font and part of the arcade of Emmanuel College, Cambridge, which were built between the years 1668 and 1677, the chapel having the date 1673 over the clock. The architect employed was Dr., afterwards Sir Christopher, Wren, who at the time was actually engaged on the erection of the new chapel at Pembroke College. His employment at Emmanuel was probably due to his constant intercourse with the master, Dr. William Sandcroft, who was also Dean of St. Paul's, upon the rebuilding of which Wren was also engaged. The design for the Emmanuel Chapel was elaborated by Sandcroft, probably in consultation with Wren, and Dr. Sandcroft took great interest in the work of erection, and contributed largely to his funds. The woodwork of the chapel was designed by a Mr. Oliver and a Mr. Pierce, and executed by Cornelius Austin.

Proposed New London Buildings.

The following new works were among those recommended for consent to the Council meeting of Tuesday last:—

Erection of a building on the southern side of High Street, Clapham, to abut also upon the western side of Cato Road, on the application of Mr. A. C. Thomas, on behalf of Temperance Billiard Halls, Limited.

Erection of a building on the eastern side of Briant Street, New Cross, on the application of Mr. L. V. Hunt, on behalf of the British Colour Printing Company, Limited.

Erection of a house on the eastern side of Garthorne Road, Honor Oak Park, to abut also upon the northern side of Agnew Road, with projecting bays and a porch, on the application of Messrs. Dunsmore Brothers.

Erection of two houses on the northern side and two houses on the southern side of Baldry Gardens, two houses on the northern side and one on the southern side of Heybridge Avenue, and sixty-six houses on the eastern and western sides of Copley Park, Streatham, on the application of Messrs. Hill and Tyler.

Erection of buildings on the eastern side of Bromley Road, Catford, on the application of Messrs. Norfolk and Prior, on behalf of Mr. J. Watt.

Erection of buildings on the site of Nos. 59 and 61, Webber Street, Southwark, on the application of Mr. W. Egerton, on behalf of Maltina Bakeries, Limited.

Erection of two houses on the northern side of George Lane, Lewisham, to be known as Nos. 175 and 177, with irregular open spaces at the rear, on the application of Mr. F. E. Wright.

HOUSE IN THE CLEVELAND DISTRICT.

This small country house has recently been erected in a picturesque part of the Cleveland district. The site was well adapted for placing the building on a natural terrace fronting a spacious lawn, from which to the entrance from the road the land is nicely wooded with fine oak and beech. The elevations have been kept simple, 2¼in. Loughborough sand-faced bricks being used, with half-inch flush joints; the tiles are hand made of the same material, mixed indiscriminately with various grades of rough and smooth faces. No lead flashings have been used, all tilework being tilted next brickwork and carried into chase in brickwork and pointed in cement, with half-round hip tiles "kicked" up and flashed up in cement. The windows have solid frames and casements with brick on edge to heads and with the brickwork "running through" at the sills. The storeys are 9ft. high. The tops of door and window architraves are level, with similar mould between forming the picture rail, thus giving an unbroken frieze to all rooms. The walls are 12ins thick, formed of two 4½in. bricks and 3in cavity. The whole of the wood-work inside and out is painted white, the spout and rainwater pipes being finished dul black. The contractors were:—Brickwork etc., Messrs. Doughty and Sons; carpente and joiner work, Messrs. Hudson Bros. tiler, W. Neal; painter, J. H. Hill; all o Middlesbrough. Plumber and gasfitter, etc T. B. Watson and Sons, of Stockton-on-Tees. The whole of the work, includin laying out of the grounds, was carried ou under the supervision of the architect, M James Forbes, 43, Albert Road, Middle brough.

HOUSE IN THE CLEVELAND DISTRICT, YORKSHIRE. JAMES FORBES, ARCHITECT.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Buildings in North Brittany.

PORTSMOUTH.—R. writes: "Spending a week at Paramé, and a second at Granville, what ought one to see in the neighbourhood? And what is the best guide book to that part?"

Paramé is comparatively modern; but St. Malo, which is but two miles distant, offers more of interest in old buildings, if those are in request by the querist. There are many books on Brittany, for which publishers' or library catalogues should be consulted; and as to guide books, either Murray or Baedeker would be found satisfactory.

Pavement for Slaughter-houses.

With reference to the enquiry answered on p. 145, in No. 732, Mr. W. Roland Howell, A.R.I.B.A., of Reading and London, writes:—"About two years ago I had an important slaughter-house to erect, and made exhaustive enquiries as to the best material to use for the floor, and I was convinced by practical slaughtermen that neither asphalte nor any form of concrete *in situ* gave sufficiently good foothold. The slaughtermen were unanimously in favour of York stone, and by selecting a specially hard stone and laying with very fine joints, a floor was obtained which experience has shown to be in every way satisfactory. This may interest your correspondent 'R.C.B.'"

Sea Sand for Concrete.

ST. ANNES-ON-SEA.—"T.E." writes: "The answer to 'A.J.H.'s' query, in your issue of February 24th, concerning sea sand and shingle for concrete, states that these materials possess the merit of being sharp and clean. I should be glad of information where sea sand of a sharp nature is to be found."

If the question is "writ sarkastic," our correspondent has over-reached himself. We would, in turn, like to ask him if he can find any commercial sand that conforms to his interpretation of the word "sharp." All sands have rounded grains, and, even if obtained from a land pit, were deposited by water, and are therefore water-worn. The meaning of the customary expression "sharp and clean" (if either is used singly the meaning of the specification may be disputed) infers that a sand is not to feel soft when rubbed between the fingers, as it would do if greasy or loamy; and that it must not contain any mould, organic matter, mica, clay, loam, or other ingredients that would wash off and become suspended in water.

Adhesive Bond of Reinforcing Bars.

EDINBURGH.—"'BRICK" writes asking for the relative strengths, respectively, of three steel bars, square, spiral or twisted, and round, of equal weight, each 12ins. long and each having a sectional area equal to 1in. by 1in. Also the relative strengths of the same bars placed in the centre of a concrete slab 6ins. square by, say, 2ft. long. This enquiry has reference to the value of adhesion and mechanical bond developed by bars in reinforced concrete. The tests that have been conducted do not give sufficient data to answer with any close degree of accuracy. As regards the first part of the question, if the rods were all of mild steel, their ultimate resistance would be about 64,000lbs., and their elastic limit about 32,000lbs. The adhesion depends upon the nature of the surface, and when the plain rods have rusted before being embedded in concrete they usually pull out only when the elastic limit is exceeded. Consequently, both the square and round rods would probably require 32,000lbs. pull to move them. The twisted bar gives a better hold, as it affords a certain amount of mechanical bond; it also has a greater surface, owing to the greater length of the surface than the axial line. But the tests conducted as to the resistance of twisted bars are by no means conclusive. Apparently, we might allow about 50 per cent. increase of resistance. The twisting of such rods, if done after rolling, increases the ultimate resistance and elastic limit up to about 80,000lbs. and 42,000lbs. respectively.

BIRMINGHAM CLERKS OF WORKS AND BUILDERS' FOREMEN'S ASSOCIATION.

Mr. G. Salway Nicol, A.R.I.B.A., has delivered before members of this association a lecture on "The Great Palaces and Churches of Italy." Mr. Nicol, it will be remembered, was in 1907 awarded the Tite prize by the Royal Institute of British Architects, which enabled him to travel and study in Italy for six months. Mr. Nicol showed a large number of the drawings which he made whilst on his tour in Italy. The lecturer traced the influences that the Renaissance has exercised upon various buildings of later periods. Thus the art of classical Rome, as exemplified in such buildings as the Pantheon, influenced such Renaissance designers as Bramante, Sangallo, and Michael Angelo, whose work in turn directly influenced later buildings, such as the Dome des Invalides in Paris, and St. Paul's Cathedral in London.

Middlesbrough Free Library Committee have decided to adopt the open-access system for the non-fictional part of their proposed new library, the point having been raised by an inquiry received from a firm of London architects.

Architectural Societies.

R.I.B.A.

New Members.

At the business meeting on Monday, March 1st, the following gentlemen were elected members of the Institute.

As Fellows (’.

T. N. Dinwiddy, London; W. R. Howell, Reading; R. Willock, London.

As Associates.

J. Allner, Blandford, Dorset; H. J. Ash, Nuneaton; A. E. Beswick, Swindon; J. E. Bownass, Windermere; E. H. Buckingham, Norwich; F. T. Bush, London; E. S. Coldwell, London; W. A. Daft, Oxford; P. Dalton, Ainsdale, near Southport; H. F. Davies, Chester; W. Dean, St. Leonards-on-Sea; J. L. Denman, Brighton; R. C. Foster, Buckhurst Hill; H. French, London; A. Graham, London; C. Groves, Newcastle-on-Tyne; H. Healey, Rochdale; T. H. Hill, Manchester; T. S. Hosking, Llandrindod Wells; G. E. Hunter, Newcastle-on-Tyne; S. H. H. Ixer, London; H. G. Lay, Wellingborough; W. P. Major, Bristol; S. W. Mobbs, Lowestoft; C. J. Mole, Plymouth; E. Morley, Bradford; S. A. Neave, Sydney, New South Wales; J. T. Penfold, London; F. J. Potter, London; A. W. Ruddle, Peterborough; C. B. Smith, Ipswich; J. B. Surman, Birmingham; W. Sutcliffe, Todmorden; B. H. Sutton, Reading; F. Sykes, Manchester; W. J. M. Thomasson, Bournemouth; R. J. Tyndall, London; R. N. Vanes, London; J. H. Vaughan, Newport, Mon.; F. D. Ward, Hastings; H. G. Warren, London; T. H. Whittaker, Nottingham; W. H. Wilson, Sydney, New South Wales; E. M. Wood, Cardiff.

As Hon. Corresponding Members (2).

Adrien Delpy, architect, Brussels; Charles Louis Girault, Government architect, Paris.

NORTHERN ARCHITECTURAL ASSOCIATION.

A dinner to commemorate the fiftieth anniversary of The Northern Architectural Association was held on February 22nd, at the Grand Assembly Rooms, Newcastle. Mr. G. T. Brown, as president, occupied the chair. Among the seventy members and guests present were Mr. Leonard Stokes (vice-president of the Royal Institute of Architects), Sir George Hare Philipson, Sir Isambard Owen, Mr. E. R. Robson, F.S.A., Mr. Paul Ogden (president of the Manchester Society of Architects), Mr. P. Robinson (president Leeds and Yorkshire Architectural Society), and Mr. Charles S. Errington (hon. sec.).

After the loyal toasts had been honoured, Mr. E. R. Robson gave "The Northern Architectural Association." He said he regarded that meeting to be of exceptional importance, not so much for the great joy arising from a review of the past, but rather as a point of vantage from which to secure greater esprit de corps in the Association to excite among its members themselves a loftier enthusiasm for the art of architecture, and thus to exert greater influence on the public knowledge and taste. Unfortunately, the subject that must above all others engage the attention of the Association was the present deplorable position of the profession throughout the United Kingdom. To such depths had architects at last been relegated in public estimation that competition was invited for the most ordinary buildings, because people found that they could have a hundred or more designs to choose from at almost, sometimes quite, the cost of one. If this was a wise and just treatment of one profession, why should it not be extended to others? Another evil of the competitive system was that the architect had then no client with whom he could confer from time to time as his designs progressed. It occurred to him that competitors should be restricted in number to such an extent that the assessor could really compare every *projet* with every other and thus do justice to all. The assessor should in the first instance see the site and, of course, have a voice in framing the conditions, which should be binding alike on the employer, the competitors, and the assessor. Finally the award of the assessor should not be liable to be upset even by the well-meaning gentlemen who formed the committee and who inaugurated competitions. The President, in responding, spoke of the inauguration of their Association in 1858, and mentioned the names of the 27 founders. Two of these gentlemen, Mr. E. R. Robson and Mr. Haswell, were present with them that evening. The objects of the Association were to promote union among its members, and the elevation of professional architecture, to establish a uniformity of practice, and the general advancement of the art and science of architecture. They had many links at that meeting between the present and the past 50 years. They had present the son of Mr. Thomas Oliver, the first honorary secretary; and the son of Mr. Oswald, who was president in 1880. Mr. F. R. N. Haswell, of North Shields, one of the founders of the Association, spoke a few words regarding its history and work. Sir Isambard Owen gave "The Royal Institute of British Architects and the Allied Societies," which was responded to by Mr. Leonard Stokes, Mr. Paul Ogden, and Mr. P. Robinson. Mr. A. B. Plummer gave "The University of Durham," to which Sir George Hare Philipson responded.

SOCIETY OF ARCHITECTS.

The Society of Architects will hold their twenty-fifth anniversary dinner on Friday, April 23rd, at the Trocadero Restaurant, London, W., at 6.30 p.m., Mr. George E. Bond, J.P., the president, in the chair. The society propose to organise an excursion, open to members and their friends, leaving London on Thursday, May 2th, for Rochester, and going on to Canterbury and thence to Dover on the Saturday, where the week-end will be spent. The Mayor of Dover, Alderman Walter Emden, past-president of the Society, has kindly expressed a wish to entertain the members and facilitate their visits to places of interest. The party will return to town on Tuesday, June 1st. The 1909 regulations and conditions for the design competition for the Society of Architects' travelling studentship (value £25 and a silver medal) have been published. Candidates must be on the society's register of students, and must not be more than twenty-eight years old. The subject is a secondary school, and the drawings must be delivered not later than May 1st, 1909, without name, motto, or other mark of identification, but with a plain sealed envelope attached containing the competitor's signature and address, and the usual declaration. The winner will be required to take a sketching tour of not less than three weeks' duration, between June 1st and October 1st. The qualifying examination for membership will be held in London and Manchester on April 6th, 7th, and 8th, and also at Oxford and other centres, provided the entries are sufficient in any one district; the entries closing on March 22nd. The entires for the architectural scholarship of £10 close on April 1st, and the examination is to be held on Monday, April 5th.

DEVON AND EXETER ARCHITECTURAL SOCIETY.

The annual meeting of the members of the Devon and Exeter Architectural Society (embracing the counties of Devon and Cornwall) was held at the Central Hotel, Plymouth, recently, the president, Mr. James Crocker, F.R.I.B.A., of Exeter, in the chair.

The hon. secretary presented the annual report, from which it appears that the membership is now eighty-five.

The following members constitute the officers and council for the ensuing year, viz., Mr. W. H. May, M.S.A. (Plymouth), president; Mr. Charles Cole, M.S.A. (Exeter), vice-president; Messrs. M. Alton Bazeley (Plymouth), James Crocker, F.R.I.B.A., John M. Pinn, T. A. Andrews, J. A. Lucas, A.R.I.B.A., O. Ralling (Exeter), C. Cheverton, M.S.A. (Devonport), J. C. Southcombe (Barnstaple); S. Dobell, hon. treasurer (Exeter); and Allan J. Pinn, A.R.I.B.A., hon. secretary (Exeter).

Votes of thanks were accorded to the retiring president, and to the hon. secretary.

The meeting was followed by a luncheon, at which a short toast list was gone through.

Law Cases.

Architect's Liability for Materials Ordered.

At the Somerset Assizes, on March 1st, the Ham Hill and Doulting Stone Company, Ltd., of Yeovil, sued William Beddoe Rees, architect, of Cardiff; the Rev. Wm. Thomas, minister of the Tabor Calvinistic Methodist Chapel at Maestag, South Wales; and Messrs. W. G. Roberts and Thomas Morgan, members of the Building Committee of that chapel, the object of the action being to recover £196, balance of account due for stone supplied. Mr. J. Alderson Foote, K.C., and Mr. C. A. S. Garland were for the plaintiffs, Mr. Clavell Salter, K.C., M.P., and Mr. Hickman appeared for Mr. Beddoe Rees, and Mr. Holman Gregory was for the Rev. W. Thomas and Messrs. Roberts and Morgan.

Mr. Foote said the action was simply on the question as to who was responsible to the plaintiffs for payment for the stone which they supplied. He did not think, after the correspondence which had taken place had been read, any evidence would be necessary, as the matter turned almost entirely on the correspondence. The action was originally brought against Mr. W. Beddoe Rees for the price of stone supplied, but Mr. Rees pleaded that he had only contracted as agent for the building committee, which consisted of 200 or 300 people, being the whole of the male members of the chapel. Eventually Mr. Rees gave the names of three of them, and said he could not possibly give any more. Thereupon plaintiffs added these three. They now appeared, and denied that they had authorised Mr. Rees, the architect.—Mr. Salter: We say that Mr. Rees, if he bought the stone, bought it on behalf of the committee, but we deny that he bought the stone at all.—Mr. Foote contended that if Mr. Rees signed the contract for the stone in his own name, without naming the principals, he was liable, unless there was something in his letters saying that he should not be liable. The correspondence, Mr. Foote added, was of terrific length, and it would take him a long time to get through it, but there was nothing else in the case. There was no dispute as to quality or quantity. The only question was as to who contracted. —Mr. Gregory said that Mr. Rees was architect, and was agent for the committee for certain things, but the question was whether he was agent for getting this stone. He had no authority from the building committee to make a personal contract for the supply of stone, because the committee had arranged a lump-sum contract with the builder.—Mr. Foote then occupied about two hours in reading the correspondence, which extended to nearly 400 letters.—In the written defence put in on behalf of Mr. Beddoe Rees, he denied that the stone was sold to him, and he did not admit that he ordered from the plaintiffs at all, or that he entered into an agreement with them. In the alternative, he said that if he gave the plaintiffs any order—which was not admitted—he did so as architect or agent for the building committee for the supply of stone to the contractor, and not to the defendants.—Mr. Clavell Salter submitted that not only had the plaintiffs failed to prove that Mr. Rees made himself responsible for payment out of his personal pocket for this stone, but a great number of the letters made it perfectly clear that the plaintiffs understood that, as far as Mr. Rees was concerned, his position was only that of architect. It was a question of fact upon the whole correspondence for his lordship to decide whether or not Mr. Rees contracted for a disclosed principal, and Mr. Salter submitted that throughout the whole business Mr. Rees contracted as agent, and for a disclosed principal—the building committee.—His lordship said he thought Mr. Rees made himself liable by saying, "I accept this," and not saying that he accepted it on behalf of someone else.—Mr. William Beddoe Rees then gave evidence, and said he advised Mr. Staples, plaintiffs' representative, in the course of an interview, to get the order from the builder, because the money would pass through him in the usual way; and he agreed to do it, and also agreed to the arrangement that the money should pass through the builder.—His Lordship (to Mr. Rees): But you made the contract in your own name?—Mr. Rees: But Mr. Staples knew.—His Lordship: It doesn't matter if he did know. There is a similar case pending in London now.—Mr. Gregory submitted that there was no evidence against his clients. Messrs. Thomas, Roberts, and Morgan.—Mr. Foote thereupon elected to proceed against Mr. Rees only, and asked for judgment against him.—The learned Judge said the main question was whether Mr. Beddoe Rees was liable upon the contract for the supply of this stone, and he was of opinion that he was so liable. The principle had been properly stated by the learned counsel on both sides, but the question was the proper application of it. He came to the conclusion that the plaintiffs were entitled to recover, and he therefore gave judgment for the plaintiffs, with costs, against Mr. Beddoe Rees. He would enter judgment with costs in favour of the three co-defendants, Messrs. Thomas, Roberts, and Morgan; but he reserved his decision on the question whether their costs should be paid by Mr. Beddoe Rees.

Borough Surveyor's Death from Septic Poisoning: No Compensation.

A somewhat novel point under the Workmen's Compensation Act has been decided by his Honour, Judge Ingham, at the Evesham County Court. An application for compensation was made by Mrs. Gertrude Amelia Mawson, of Victoria Avenue, Evesham, by reason of the death of her husband, Robert Collett Mawson, borough surveyor, who died on April 20th, 1908. The defendants were the mayor, aldermen, and citizens of Evesham.—Mr. Cotes-Preedy appeared for the applicant, Mr. E. W. Cave for the respondents.—Mr.

Cotes-Preedy stated that the deceased, who had a salary of £190 per annum, was 51 years of age when he died, had been 25 years in the employment of the Evesham Borough Council, and left a widow and two children. In January, 1908, it was decided to clean out a pond in the recreation ground. It had not been cleaned for some years, and apparently had been the rubbish pit for the town, as it contained cats, dogs, vegetable matter, and tin cans, the stench from it being extremely bad. The deceased had to superintend the work, which had been entrusted to a man named Clements. Mawson, a few days after commencing the work, complained to his wife of feeling ill, and, in addition, had the misfortune to slip into the pond up to his knees. He got steadily worse, and went to a doctor on March 5th.—The witness Clements stated that he had had considerable experience with drains and ponds, but had never smelt such a stench as emitted from the pool.—Dr. Gordon Evans gave evidence, and stated that Mawson suffered from laryngeal and faucial ulcerations due to septic poisoning, produced by micrococci inhaled from some virulent source. Judging from the patient's condition, he was of opinion that the invasion of the disease must have commenced not more than two months and not less than three weeks before he first saw him.—His Honour dismissed the application, with costs, considering that the point was governed by Broderick v. London County Council, in which case the Court of Appeal had held that a workman employed in sewers, and who developed enteritis, could not recover compensation.

A Falling Wall: Damages Against Contractor.

At the West Riding Assizes at Leeds, on February 23rd, Mr. Justice Coleridge heard a claim by Sydney Hill, of Andrew Street, Sheffield, against Messrs. Henry Boot and Son, contractors, Sheffield, for personal injuries received. Plaintiff, who claimed through his father, was represented by Mr. T. E. Ellison (instructed by Mr. J. E. Wing, Sheffield), and defendants were represented by Mr. Scott Fox (instructed by Messrs. Branson and Son, Sheffield).—Mr. Ellison stated that the plaintiff received the injuries on October 12th last year. He was only fourteen years of age, and as a result of the injuries received he had had to have one of his legs amputated. A building was being pulled down by the defendants, and plaintiff, who was playing with other boys near by, was struck by débris. He was removed to the hospital, and amputation was found necessary.—Sydney Hill was called, and had to be assisted into the witness-box. He said that on October 12th he and some more boys were playing in Andrew Lane, near his home. He dropped a stick he was carrying, and when he stooped to pick it up he was knocked down by the wall, which fell on him. He had never been warned not to play near the building.—Albert Edward Marshall said he saw the piece of wall fall on the boy. He helped to take him to the hospital. There was no opening in the hoarding near to where the boy was struck. —Police-Constable Bainbridge said he made inquiries at the building immediately after the accident. He saw a gentleman named Boot, who gave the name of Henry Boot and Son, Moor Street, Sheffield. Nobody suggested to him that any blame was attached to the boy, but the foreman said the boys had been picking up sticks all the morning. —John Lancashire, surveyor, Hartshead, said the road was 14ft. wide from building to building. In his opinion the method of pulling down the building was perfectly safe if people were not about.—Albert Green, a Corporation official, cross-examined by Mr. Scott Fox, said, with regard to the narrowness of the roadway, it would not have been possible to erect a covered footway alongside the hoarding.—Ernest Kemp, joiner, said he saw the lad Hill inside the hoarding early in the morning, and told him to clear out. The boys were always running in and out.—Arthur Thomas Smith, general manager for Messrs. Boot and Son, said he had been specially requested by Mr. Green and Mr. Sims not to erect a canopy over the footway beside the hoarding, on account of complaints that had been made by someone who carried on business in the lane.—George Crackell, the foreman, said no matter how the wall had been taken down, there might have been danger to passers-by.—Mr. Nixon, veterinary surgeon, said that he had told the lad that morning not to gather sticks near the hoarding. The lad was impudent to him, and flung a piece of brick at him.—A scaffolder named Mara said he had heard the watchman warn plaintiff of the danger. He told him to go away, or he would throw half a brick at him.—Mr. Ellison submitted that if proper precautions had been taken the accident would not have happened.—His Lordship said he did not think the warning given was calculated to impress upon the boys what the danger really was. Apart from this, there was a doubt whether proper precautions had been taken with regard to the hoarding. Taking the whole case into consideration, he thought plaintiff had succeeded.—With regard to compensation, he thought £130 would be an adequate amount, though he wished he had had a jury to aid him in his assessment.

DESIGN AND CRAFT IN ENGLISH WOODWORK.

Prof. Beresford Pite delivered a fascinating lecture on "Design and Craft in English Woodwork," at the Carpenters' Hall, the chairman being Mr. T. G. Jackson, R.A. Professor Beresford Pite began by stating that woodwork is in many cases the basis of stone architecture. He briefly dealt with the wooden architecture of the Mycæneans which underlays the art of the Greeks and Romans, and passing on said that we can discern in early Egyptian architecture, the character of which is so clearly in our minds, an origin related to the reed and mud architecture of the Nile valley. Recognising the trabeated or "beam" style of ancient wooden architecture, the mind recognises how useful wood is in building. Both Egypt and Greece were stone-producing and stone-building countries, yet each derived its stone architecture from wooden ideals. Stone, he said, in itself, does not yield a significant type of architecture; for instance, we have had Stonehenge in our midst for centuries. It stands as a relic of a stone-building age, but has had no descendants, and has produced no school. The wood-producing countries of Scandinavia and Northern Europe have produced no lasting wooden art. The lecturer next drew attention to a remarkable survival of Saxon wooden architecture, within easy reach of London, namely, Greenstead Church, near Ongar, in Essex. This was built as a temporary chapel, in which the body of King Edmund the Martyr (who had been murdered by the Danes) was deposited for one night, while being translated from London to Bury St. Edmunds. The walls are formed of upright wooden logs, roughly adzed on one side, put close together, the outside being left in the natural state. English architecture started from the year 1000, and until the advent of the Renaissance, it was essentially a *stone* architecture, the mason's art was paramount. There were many remains of Roman architecture in England in the 4th and 5th centuries, but the whole of this work seems to have been disregarded, for we still find examples of Saxon art in the 5th century. With the advent of the Normans came a vigorous art from Caen. There is no Norman building in this country more expressive and more important than the Tower of London, more expressive because it is one of the few buildings which still fulfils its purpose. By the 13th century, he said, we have a marked English masons' art. During the 500 years since A.D. 1000, the architecture of England shows a more complete grasp of the subject than any other period succeeding the Conquest. As an example of 14th century work, he mentioned the triforium of Westminster Abbey, and drew attention to the fact that this fully-developed style had been produced by English masons in 200 years from the Norman Conquest.

During this period there were two main streams of architecture, (1) military, (2) ecclesiastic. The domestic work was of an inferior character, and where it existed was probably half-timbered work. All through this period, with the exception of the domestic work, carpentry follows masonry. Although it has its own utility and its own purposes, yet it derives all its forms from masonry. He illustrated this by means of examples of 13th and 14th century woodwork, the carving on which was a direct copy of stone forms of the period. The choir stalls at Winchester Cathedral were shown as examples of 13th century work, and the lecturer drew attention to the similarity between the canopies over these and the stone ones on the tomb of Aymer de Valance, in Westminster Abbey. They were, he said, an exceedingly skilful adaptation of the stonework of the day, but nothing more. The stalls of Henry VII.'s chapel at Westminster show a departure from recognised Gothic methods; the carpenter was evidently shaking himself free from stonework traditions, and so we come down to the Reformation. The lecturer next dealt briefly with the wonderful roofs of the period, particular attention being paid to those in London, the roof over Westminster Hall, he cited as the finest example of a mediæval roof in the world, having a span of 68 ft., the length being 240 ft. Passing on to porches, several examples of which were shown, he pointed out that the framing was carpentry pure and simple, but that where any filling-in was required, stonework forms were blindly copied. Half-timber work was briefly dealt with, and slides were shown of Old Moreton Hall, Staple Inn, Holborn, and the front of Sir Paul Pindar's house, now in South Kensington Museum. During this period, he asked, what had been happening to the wood-carving? The 13th century wood-carving was interesting as showing a strict adherence to stonework forms. In the 14th century, however, we find the character of the work altering. The carver is of necessity a more independent character, and less subject to tradition than the ordinary joiner; and so his work bears earlier evidence of the change.

Some examples of linen panelling were shown, which, the lecturer remarked were very interesting and very suggestive. The walls of the houses were, in the Middle Ages hung with fine tapestry, and these forms were produced by the joiner in his wood. The advent of the Renaissance in the 16th century, said the lecturer, created an enormous interest in woodwork. The screen from King's College Chapel, Cambridge, was instanced as being the most extraordinary and the most beautiful piece of woodwork in Europe. Mr. Gotch compares the woodwork of this screen with the Hall of Wolsey's Palace, Hampton Court, and suggests that the same workmen were employed on both, but the lecturer expressed himself of the opinion that the design was obviously based on a marble treatment, and was probably the work of an advanced Italian architect. Passing on to staircases, several examples of which were shown, including one from a house in Great St. Helens, 1646, and the grand staircase, Thorpe Hall, the lecturer drew attention to the hugeness of the framing and the great newels. In the choir stalls at St. Paul's, designed by Wren, and executed by Gibbons, he said, we see that nothing has grown out of tradition; they are a fine original effort of design in woodwork, while the screen at the back of the stalls shows a fully developed evolution of classic styles in woodwork. Finally a wooden doorway from Abingdon House was illustrated, with Doric columns on either side, and the lecturer remarked in conclusion that he had now "boxed the compass," and arrived back at the point from which he started.

EMMANUEL COLLEGE, CAMBRIDGE. CHAPEL AND ARCADE. (*See Centre Plate*).

THE NEW LONDON BUILDING REGULATIONS.

In the House of Commons on March 11th, an animated discussion took place upon the second reading of the London County Council General Powers Bill, Mr. Molteno, referring to the proposed alteration of the London Buildings Acts, said that a great additional burden was going to be placed upon those engaged in building in London. The laws were complicated, and the object of the new rules was to facilitate building with ferro-concrete and reinforced concrete, which could now only be used in addition to other walls. But the Bill, when drafted, was found to contain most minute and rigid rules applying not only to the wall, but to internal portions of the structure. The public interest was already secured by regulations as to external walls, and nothing had occurred to justify the proposed change. All the technical authorities agreed that the scope of the Bill should be limited to the enclosing and party walls, but this proposal was rejected by the County Council. The additional cost of the proposal must be very heavy, the district surveyors having pointed out that it would increase their work fourfold, and naturally they would require a fourfold fee. There were 400 persons on the technical staff of the L.C.C. architects' department, and if the proposal passed there would be 600. He protested against the Bill going to a committee, and causing heavy expense to the community and those who opposed the Bill. He pointed out that the building trade was already sufficiently depressed, and that all that was required was to amend the present Building Acts so far as reinforced concrete was concerned.

Mr. H. C. Gooch said the change proposed by the Bill was necessitated by the new style of building construction—that was to say, going from brickwork to skeleton ironwork. With skeleton ironwork they must control the interior as well as the exterior portion. If people objected to the new method nothing would prevent their putting up buildings in the old fashion. With regard to the conference with the various experts, seventeen out of twenty points were conceded to them. It was thought better to set out clearly in the Bill the various technical matters referred to.

Mr. Vivian said that it was absolutely impossible to conduct building operations with a clause of this sort. There could not be the requisite speed. In large building enterprises no such details were attempted. The selection of the County Council to listen to appeals from its own decisions was a perfect farce.

Earl Winterton suggested that the appeal authority should be composed of three members—one nominated by the Secretary of State, one by the Surveyors' Institute, and the third by the Society of Arts.

Mr. John Burns, intervening, said he was assured by members of the London County Council who were in the House that the questions referred to would receive sympathetic and serious consideration when the matter came before the Committee. He hoped the second reading would be agreed to. He wanted to see greater elasticity given to an industry which was already depressed, and which had a right to adapt itself to modern ideas of new construction. If the Bill was not passed, its rejection was going to damage building.

Mr. B. S. Straus pointed out that the appeal was not from the Council to the Council, but from the district surveyor to the Council.

Mr. Waterlow remarked that the district surveyor was not the servant of the County Council. He was not paid by the Council, but by fees under the London Building Act. He was appointed by the Council, but they could not dismiss him. He was practically appointed for life, except in the case of gross misbehaviour. The proposed appeal was from a statutory servant to the County Council. The question of the tribunal could, however, be decided by the Committee. Subclause 29 was to enable skeleton steel structures to be put up. At present they could not build them except under the Building Act, which, if they had a wall 80ft. high, necessitated their putting in the lower part of the walls 2ft. 6ins. thick, although they might be carrying the whole weight of the structure on the steel construction. That was an enormous additional cost. The object of the clauses was to enable the new system to be used economically, which it could not be at present. The system had to be supervised, and the district surveyor was obviously the right person in the first instance. The committee, after hearing technical evidence, must settle the extent of the detail to be submitted to the district surveyor.

Mr. Stephen Collins said the Royal Institute of British Architects and the various other bodies were as anxious as honourable members were for the safety and good construction of building. But in these times when the building trade was so bad, and unemployment rife, they should be careful before passing vexatious rules and laws which would hinder the trade.

In the course of further discussion, Mr. W. Guinness said it had been agreed to drop the one month's notice provided under subsection 29. Only two days' notice should be necessary at the beginning of the building under section 145 of the Act of 1894.

Mr. Courtenay Warner did not think that in that case the Bill could do the building trade much harm.

The Bill was read a second time.

In Germany, a new law has lately come into force making it an offence for a man to describe himself as a builder unless he is certified to be a "State builder." This term includes architects and engineers, but not carpenters or masons, who, when fully qualified, are described as master carpenter and master mason. Although the distinct professions of architect and engineer are not specified for registration by the State, the law is severe on people who, without being qualified, describe themselves as belonging to either of these two professions. Actions at law may be brought against unqualified men by those who are qualified, and whose professional work has been injured by the competition of the unqualified. Already there is a good deal of grumbling among the professional men in Germany at an unsatisfactory feature of the new law, for it has been found that no grievance lies against the unqualified architect unless he competes with his qualified brother professional.

SWEATED INDUSTRIES BILL.

Second Reading, House of Commons, Friday, 26th March, 1909, 1st Order.

This measure is identical with that introduced by Mr. Toulmin last year and referred to the Home Industries Committee.

The latter reported the Bill to the House without detailed comment. The second reading is proposed to be taken on March 26th, 1909. The Bill is for the moment intended to apply to the Tailoring, Dressmaking, and Skirtmaking Industries. Under the Sweated Industries Bill, clause 2, sub-section 1, a trade union or trades council, or any six individuals of any trade in any district, may apply for a Wages Board to be established in any industry. At present certain industries have established voluntary Boards of Conciliation for the settlement of the minimum rates of wages for persons therein engaged. Such voluntary agencies are effective because the parties respectively realise that, unless a spirit of fair compromise animates the deliberation of the parties, a peaceful solution is unlikely, and a fight on the question may be long and costly. Such voluntary agencies only affect, however, the members of the organisations concerned, generally the trade union on one side and the association of employers on the other. These two, however, rarely represent even a majority of employers or workmen of the district in the trade or trades concerned, so that a large number on both sides are not bound by any decision as to wages, although they may be, and generally are, influenced by it to a considerable extent.

The decisions of a Wages Board under the Act would then affect every workman and employer in the district, whether associated or not.

What is likely now to be the attitude of these various parties after this Bill becomes Law?

The associated employers may think that the machinery of the Bill affords them an opportunity to compel every non-associated employer to pay a certain minimum wage to be fixed by the Wages Board, and they may therefore be in favour of abolishing the voluntary Conciliation Boards. The trades union members may similarly think to abolish the competition of the non-union workmen who sometimes underbid them, and also desire the abolition of the voluntary Boards.

Where neither of these parties take these views, the non-union workmen may think the formation of a Board under the Act would enable them to obtain nearly the same advantages as those now obtained by the union men, without the expense of paying to a trade union, and may apply for a Wages Board themselves. Non-associated employers may consider the main advantages of association are gone when a Wages Board has been established; and even associated employers and trades union members may share this view and withdraw from their respective organisations.

It is apparent, therefore, that for various motives all parties may be disposed to apply for a Wages Board to be established for any trade, and the Bill proposes to give the Home Secretary power to extend the operation of the Act to any trade whatever.

It is likely, therefore, that if the Bill becomes Law in its present form it will profoundly affect all existing trades unions and associations of employers.

There are also many questions which cause disputes between employers and employed besides the wages question, and it is to be expected that there will be a strong tendency to extend the jurisdiction of the Wages Boards to these other questions, especially in respect to disputes arising between non-associated employers and workmen. Once a minimum rate is established, all future questions involving a raising or lowering of this rate will have to be decided by the Wages Boards.

Clause 3, sub-section 1, provides that the Board shall consist of a chairman and not less than six and not more than ten other members, as the Secretary of State may decide. Sub-section 2 provides that one half of the other members shall be representative of employers, and one half representative of employed in the trade in the district. The term district means any local area, whether county, borough, part of a county, or part of a borough, within the discretion of the Secretary of State.

Clause 7, sub-section 1, provides that any determination of a Wages Board may be made by *a majority of members present.*

Sub-section 2 provides that the Secretary of State, when determining the number of members of a Wages Board, shall determine what number, not being more than one half of the total number of members, shall form a quorum, *but the formation of a quorum shall not depend on the presence of any number or proportion of representatives either of employers or of persons employed.*

Consider the effect of these sections 1 and 2 of clauses 3 and 7. Suppose the Secretary of State decides on 6 as the number of members for a Board, 3 would have to be employers and 3 workmen. Suppose he fixes the quorum at 3, which is the largest number he can fix it at. Then, under these sections, a board consisting of a chairman, two workmen, and one employer or a chairman, one workman and two employers, could fix the rate of wages for a district such as Liverpool or Manchester or Birmingham, or even London.

Decisions under section 1, clause 7, would be carried by a majority of those present. The absence from any cause of one employer or one workman might cause the decision to vary against one party or the other most unfairly, and yet every employer or workman in a district like London would be bound by the decision.

Suppose, again, the full Board of six attended the meeting, and the three employers voted solidly in favour of one course, and the three workmen voted solidly against it. How is a decision to be arrived at?

Nothing is said in the Bill as to the chairman having a casting vote.

Is the result then to be a deadlock, and no decision to be arrived at? or is the chairman to decide the question himself? If the former, then a deadlock is often likely to arise, in practice, and would reduce the Act to absurdity; if the latter, then one man will in a large number of cases decide a question affecting a large number of employers and employed.

Again, this one man, the chairman, will probably be a person quite unconnected with the trade in question, and the ultimate result, therefore, is that an outsider determines the wages rate for all the employers and employed in a district like Liverpool or Manchester or London, without any practical knowledge of the matters under decision, and without any responsibility for any hardship which may result, and without being himself at all affected by the results of his decision.

And, bear in mind, his decision must be obeyed under penalty of fine; there is no appeal.

Clause 8, sub-section 3, provides that any person guilty of an offence against this Act shall be liable on a first conviction to a fine of £1 to £5, and for a second or subsequent conviction within two years to a fine of £2 to £20 for each offence.

The intention is quite clear as regards employers who offend, but it is seriously meant that where a trades union declines to abide by a decision this penalty is to be inflicted, and if so could it be inflicted in view of the Trades Disputes Act, and is it to be inflicted against every member of the union, or merely against the union considered as one person?

It looks as though the effect of the establishment of a Wages Board for any trade would be to abolish the right of strike or lock-out for the workmen and employers of that trade. Surely this is not a result contemplated by the unions, who have hitherto always declined to be parties to any scheme of compulsory arbitration.

Then there is the question of varying decisions of Wages Boards in contiguous areas. Take the case of the London boroughs, about 28 in number; suppose any trade exercised in the majority of these boroughs applies in each of them for a Wages Board and obtains its request. The rates of wages fixed by these Boards might vary in contiguous boroughs, with the result that employers on one side of a street might be paying a higher rate than those on the opposite side, for identical work, with the result that those paying the higher rate are penalised and possibly constrained to move into the lower paid district.

The tendency of conciliation schemes on the contrary is to equalise the wages for similar kinds of work in all districts, and for any variation to affect all districts alike, as for example the recent scheme adopted in the shipbuilding industry.

As regards the building trade it may be thought that the points which have been thus far discussed are not likely to affect that trade, but this is by no means sure.

Wages for skilled artisans in identical branches of the trade range from 6d. to 11d. per hour, and it is extremely likely that in the lower paid districts an attempt would be made to have Wages Boards established for the purpose of levelling up this difference quite apart from the general considerations referred to at the beginning of these observations.

Enough has been said, we think, to show that this measure is one of far-reaching importance, especially to those industries which have set up voluntary agencies for the settlement of disputes; and the Bill ought not to be allowed to pass without the most searching criticism, and the provision of suitable amendments safeguarding such voluntary agencies.

At a special meeting of the committee of the Hereford Co-operative Housing, Ltd., held recently, Messrs. Groome and Bettington, architects, were instructed to accept the tender of Messrs. W. P. Lewis and Co., Hereford, for the building of twenty cottages on the site near Barrs Court station.

The "Koh-i-Noor Pencil Calendar," issued by Messrs. L. and C. Hardtmuth, is exceedingly handy for office use. It is a box-form "perpetual" calendar, constructed of cardboard, the dates being changed by a twist of the rollers upon which they are wound. Messrs. Hardtmuth may be congratulated on their adoption of a happy idea for the advertisement of their famous pencils.

* * *

From December 11, 1905, up to December 31, 1908, the Local Government Board have held 132 inquiries in connection with housing schemes, and have sanctioned ninety-eight loans, representing a total of £572,443. The largest loans were: Sheffield, £46,100; Liverpool, £58,000; Hornsey, £45,300; Bradford, £43,668; Manchester, £38,100; Leeds, £34,680; Richmond, £30,400; Swansea, £30,990; and Sunderland, £29,633.

* * *

A point in town planning is suggested by a writer in an Uxbridge newspaper. The present appearance of the local development at Hayes Station, and also around West Drayton Station, has given him the idea. At the first-named place, the factories as yet are fortunately all on one side of the railway, and on the other side there is springing up quite an attractive colony of dwelling-houses. Why not keep up this distribution? In this nerve-distracting age it is no joke, even to a workman, to live in the midst of the noise and clatter of factories in active operation, and it would certainly be to the interest of the employers, as well as to the comfort and physical welfare of the employees, if the place of work and the place of residence could be thus nicely separated. The same applies to West Drayton, which might be retained as the residential quarter, and to Yiewsley, which might be more consistently made use of as the workshop.

FIRE-RESISTING CONSTRUCTION SECTION.

(MONTHLY.)

TEST OF A REINFORCED TERRA COTTA COLUMN.

There was recently tested at Phœnixville, Pa., a reinforced terra cotta column, 21ft. 7½ in. long and 21¾ in. in diameter, which was subjected to a maximum load of 4,109 lbs. per square inch, and, according to the report of Robert W. Hunt and Co., of Chicago, who made the test, was not injured.

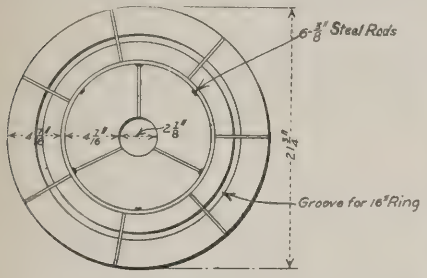

FIG. I. SECTION OF REINFORCED TERRA COTTA COLUMN.

The column was built of special shaped, hard burned, terra cotta tile, composed of two concentric rings, the inner one of three and the outer seven tiles. The vertical reinforcement of six ⅜in. steel rods was placed in the circular joint between the inner and outer rings.

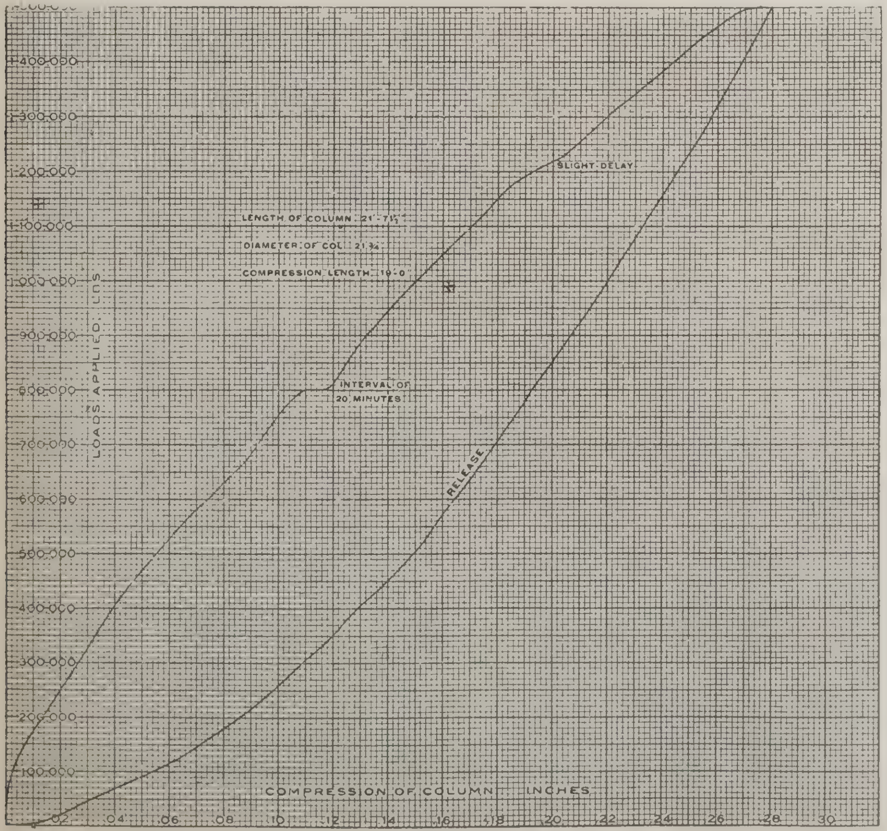
The column was built of 106 courses of tile, each approximately 2¼ in. thick, and containing in the other ring a 1-in. circular groove, ¼ in. deep, in which was placed a welded ring of 3-16-in. wire, 16 in. in diameter. Through the centre of the column was a 2 ⅞-in. hole. The mortar in the horizontal joints was one part Portland cement, one part torpedo sand, and one part fine sand. In the first seven courses the mortar in the vertical joints was one part Portland cement and three parts torpedo sand. In the vertical joints of the remaining courses the mortar was of the same proportions as in the horizontal joints, with, however, the addition of 7 to 10 per cent. plaster of Paris in the outer ring, added to make a stiff and quick setting mortar. All joints were ¼ in. thick. A cross section of the column is shown in a sketch reproduced herewith.

Samples of the materials entering the column were tested. The steel samples showed elastic limits of 67,430 and 71,390 lbs. per square inch, respectively; the wire for the rings, elastic limit, 48,900 and 51,780 lbs. per square inch; half tiles, crushing load, from 10,000 to 12,338 lbs. per square inch; full-size tiles were tested to the capacity of the machine without crushing, amounting to 8,812 and 9,066 lbs. for the two specimens.

The column was shipped to Phœnixville from Chicago on an ordinary flat car in the early part of November, arrived in good condition, and was tested in a horizontal position on November 10, 1908. The compression curves for loading and release are shown herewith.

The load was run up to 800,000 lbs. in 19 minutes, taking readings at each 25,000 lbs. lb. increment. A stop was then made for examination, and upon resuming the remaining load of 700,000 lbs. was applied in 10 minutes, taking readings at each 25,000 lbs. increment above 1,200,000 lbs. At the maximum load of 1,500,000 lbs. the compression in the 19-ft. length between points of measurement was 0.27 in., increasing to 0.28 after the elapse of a minute. The load was then rapidly released, dropping to 50,000 lbs., and a compression of 0.032 in. in 10 minutes. Five minutes later, with no load, the compression was 0.010 in., and after the elapse of 20 minutes more the compression was 0.006 in. Since the cross section of the column is 365.051 sq. in. the maximum load was 4,109 lbs. per square inch.

An examination showed that the column was unharmed. At a point 6 ft. 4 in. from the top end a slight scale, at points on opposite sides of the column, had fallen from three different tiles. These had a maximum diameter of ¾ in., were less than 1-32 in. thick, and consisted of the outside glazing. There was absolutely no sign of failure, the report of the testing engineers states, in the tiles or in the joints.



REINFORCED TERRA COTTA COLUMN. COMPRESSION CURVES FOR LOADING AND RELEASE.

L.G.B. AND A FIRE DANGER.

The guardians of the poor of the Kingston Union were summoned at Kingston for erecting additional workhouse buildings in the district of the Maldens and Coombe Urban District Council which were an infringement of the building by-laws of that Council.—It was stated on behalf of the Maldens Council that the buildings were constructed of wood, and that there was, therefore, a great danger of fire.—Mr. Macmorran, K.C., on behalf of the guardians, said the buildings were erected only as a temporary measure to relieve the overcrowding at the Kingston Workhouse, pending the report of the Royal Commission on the Poor Law, which might render a costly new workhouse useless. He also reminded the Bench that the Local Government Board had offered a way out of the difficulty by proposing to sanction a special by-law which would exempt the buildings from the operation of the by-laws of the Maldens Council, and that this special by-law the Maldens Council had refused to accept. Had this offer been taken, the Court would have been spared the lamentable spectacle of two public bodies fighting each other. He also pointed out that there were 140 poor people now being accommodated in the buildings, and that if the guardians were convicted the buildings would have to be pulled down. The Bench decided to dismiss the summons.—Mr. A. C. Mackenzie asked the Bench to state the reasons upon which the summons was dismissed.—The chairman declined to do this, and stated that if the Bench gave an opinion of the action of the Maldens Council in the matter they would have to use some very strong expressions.

NATIONAL FIRE BRIGADES UNION.

The Duke of Marlborough presided at the annual dinner of the National Fire Brigades Union, which was held at the Holborn Restaurant on March 10th. There was a large attendance, among those present being Captain Hamilton, chief officer, and Mr. Gamble, Lieutenant Sladen, and Mr. A. Dyer, divisional officers, of the London Fire Brigade, Lieutenant-Colonel Fox, chief officer of the London Salvage Corps, Lieutenant-Colonel Seabroke, Surgeon-Major Maitland Coffin, Mr. Guy Pym, M. Kusel, representing the Italian and Belgian Fire Federation, and many chief officers and other representatives of fire brigades in various parts of England and Wales. Mr. Guy Pym, in proposing the toast of the evening, said that the union now comprised 650 brigades, with an aggregate membership of over 13,000 men. The Duke of Marlborough, in responding, observed that the union had that day attained its majority. In that union, which had no aid from the Government and limited support from county councils and local bodies, they had an institution which had maintained itself in a high state of efficiency entirely upon a voluntary basis. The amount of danger and risk to life to which firemen were subjected was greater than that of any soldier in the British Army. It showed, moreover, that voluntary institutions in this country could be made very forcible and effective, and that the smallest inch of compulsion on the part of the Government could make of them one of the most powerful and useful forces of the British Empire.

FIRE PROTECTION AT THE SELFRIDGE STORES.

By S. Bylander.

[Note.—The articles on the steelwork construction, etc., of this important new building commenced in our issue of March 3rd, and will be continued in subsequent issues. The present article deals with the fire-resisting construction and fire protection of the building, which have received very particular attention.

As stated in the previous article on the Selfridge Store, we are indebted to the contractors, Messrs. The Waring and White Co., Ltd., for the drawings and photographs with which these articles are illustrated. It is but rendering bare justice to this firm to acknowledge the speed and skill that they have shown in carrying out the vast amount of constructive work entailed in the erection of this extensive building. Below we give particulars of fire-proofing and mechanical appliances.]

The fire-proofing work in the Selfridge Store has been particularly well thought out, the greatest care having been taken with the object of obtaining as eminently fire-proof a structure as modern resources will admit.

In the first place, the building is of perfectly rigid construction; and, secondly, all the steelwork is covered with concrete, held in position where necessary by anchors or steel wires. Thirdly, mechanical appliances have been installed, both for extinguishing any outbreak of fire and for raising an alarm if fire should happen to occur, the objects being (a) to afford the public the utmost safeguard against risk of fire; and (b) to reduce to the lowest limit the insurance premium for the building and the stock.

It is obvious that so eminently fireproof a building must be considerably more costly than a building constructed in the ordinary way, but the two points given above have been considered to be sufficient reason for the extra expense incurred.

The steelwork frame, as well as the foundations and the piers carrying loads, have been simultaneously designed and dimensioned to carry their proportionate loads, thus providing a structure with all its different parts possessing uniform strength. Good bond is provided, so that the whole structure can be said to consist of steelwork, concrete, and brick wall firmly secured together. Steel anchors are riveted to the steel girders, and built into walls in cement mortar, thus assuring rigid bond between the walls and the steel frame. Steel and concrete have been principally used for the interior of the building, and brick and stone for the exterior; very little wood-work is used.

In order to prevent any serious damage by fire, a building should be strong enough in all its parts to withstand a high temperature, and be capable of safely carrying reasonably heavy falling material. The steelwork should be protected, fire-proofing secured around the steel, and the floors strong enough to carry falling pieces or goods.

The steelwork at the Selfridge Store is covered throughout with at least two inches of concrete, and is prevented from falling off in case of fire by 3-16in. diameter wire laid in the concrete and spaced 9in. apart. Reinforcement bars are covered with at least one inch of concrete. The aggregate of the concrete for fire-proofing was clean destructor clinker and broken brick, passing through ¾-inch mesh. The steel girders were cased in concrete before the walls were built, and the use of stone slabs has been entirely avoided.

The floors are constructed in reinforced concrete for a span of 12ft. between the steel girders. The thickness of the reinforced concrete is 6½ inches. The concrete casing to the steel girders is made specially thick, in order to form a strong support for the floor.

On top of the reinforced floor is 4-inch concrete filling, the top of which is floated with cement. The floorboards are nailed direct to concrete, without wooden battens; thus the total thickness of concrete is 10½in. No air space is provided between floorboards and concrete, so that in case of fire the floor-boards would be less liable to burn. Sprinkler pipes and electric conduits are embedded in the concrete filling. In only a few cases has a false ceiling been used, and then it has been constructed with steel bars, suspended with iron hangers to the girders. Expanded metal wired to the underside of the steel bars forms a key for the plaster ceiling.

The design of the reinforced floor is shown in Figs. 1 and 2. In Fig. 3 is shown a general plan of floor construction for part of the fourth floor. The letters on each panel of the floor indicate the thickness of the concrete, and the size and spacing of bars. The number refers to the work of the panels.

For standard panels the letter A indicates 6½-inch thick concrete, and B indicates ½-inch bars, spaced 6-inch c. to c. A sample floor slab, 10ft. wide and 12in. span, was tested and loaded up to 1,200lbs. per sq. ft. before failure.

The floors are designed to carry with safety a load of 220lbs. per sq. ft.

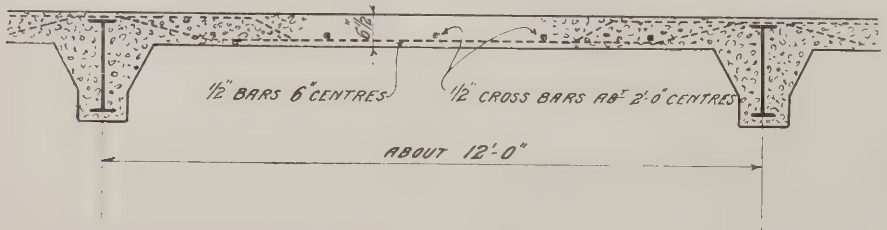
TYPICAL PANEL SHEWING REINFORCEMENT IN FLOOR

Fig. 2.



SECTION OF REINFORCED CONCRETE FLOOR

Fig. 1.

(Detailed description of the construction of the floors will be given in our concrete and steel supplement.)

The stairs are constructed in reinforced concrete, and are separated from the rooms by 3in. thick concrete partitions and 2in. thick hard-wood, fire-resisting doors. Five staircases connect all the floors with an independent exit to the street.

Nine passenger elevators, running at a speed of 300ft. per minute, are used for the communication between the different floors, and are enclosed with steel-framed screens, filled in with 3in. concrete blocks set in cement mortar. The outside is finished with ¾in. mahogany.

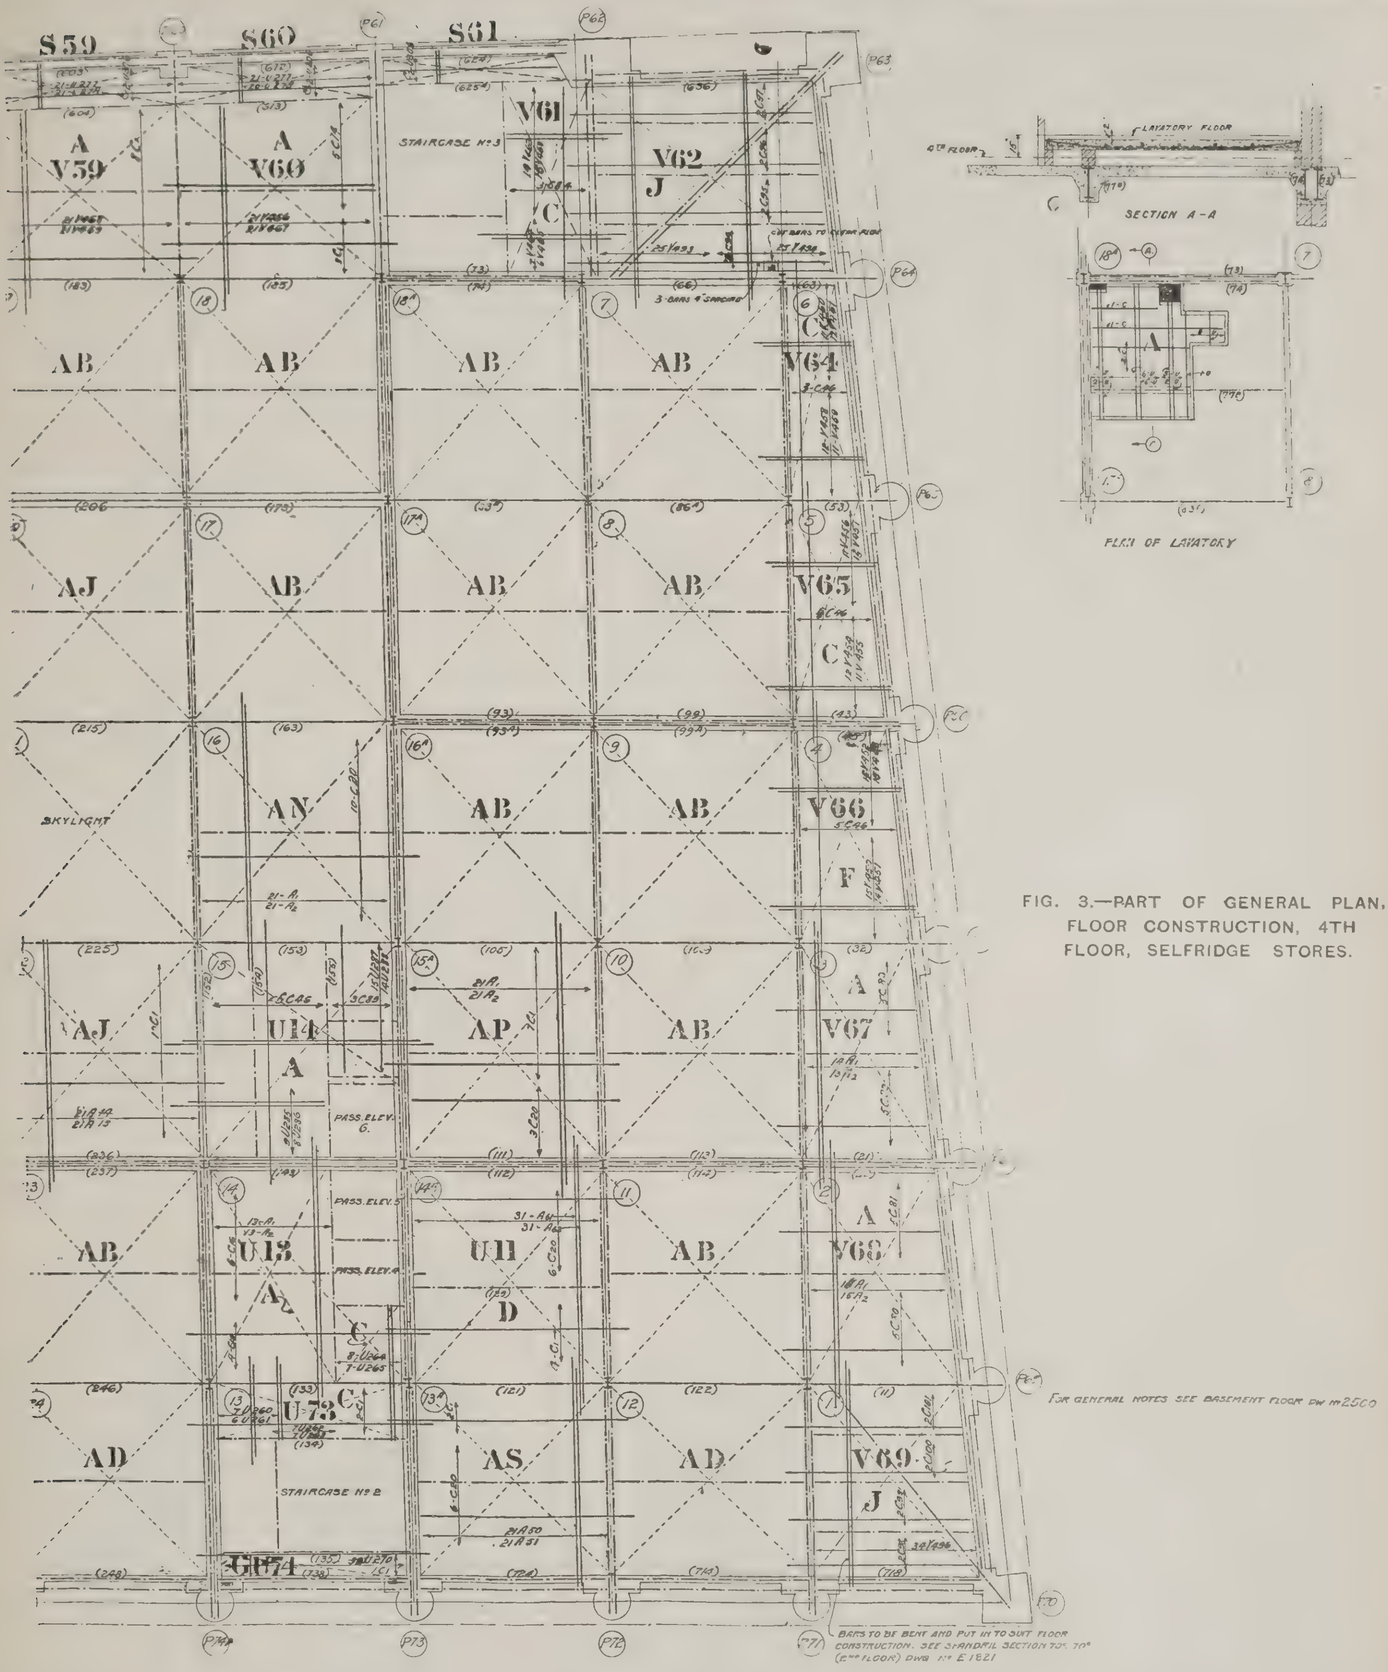


FIG. 3.—PART OF GENERAL PLAN, FLOOR CONSTRUCTION, 4TH FLOOR, SELFRIDGE STORES.

The doors are of 2in. thick hard-wood.

Generally speaking, as few divisions as possible have been put in. Partitions are built with 3in. thick concrete blocks, set in cement mortar, and braced where required with 3 by 1½ steel beams at door and window openings.

The door-openings in the division brick walls are generally 12ft. by 12ft., and are equipped with modern automatic steel rolling shutters of the Kinnear patent. About 470 roller shutters have been erected, and only a few steel folding or sliding doors have been provided.

In Fig. 4 is illustrated the construction of these doors. One shutter is placed on each side of the wall. The minimum distance between them is 2ft. 6in.

The shutters consist of continuous interlocking strips, No. 20 gauge galvanised steel. The ends of each strip are fitted with small malleable cast-iron bits, which prevent lateral motion, while at the same time filling as closely as possible the grooves in which the shutters run.

The section of the slots is such as to secure the utmost strength and rigidity, while forming in the slots themselves an interlocking hinge throughout their entire length. This also leaves the slots free to expand individually when exposed to intense heat without buckling the shutter as a whole.

The shutter coils are immediately over the door, either under the door-lintol or on the face of the wall over the door-opening. Grooved steel girders are fixed on each side of the opening, and likewise a groove is formed by means of a channel in the floor. The shutter roller, containing counterbalance springs to balance the shutter, is carried on cast-iron brackets fixed to the wall with expansion bolts. The outer hood of shutters is made of ¼inch thick steel plate. The shutters are fitted (one on each side of the wall) with mitre spur gear for opening and closing. This is so arranged that both doors are raised or lowered from either side of the opening. In case of emergency, the two shutters at any opening can be automatically lowered by means of a trip release, which is opened by putting a handle at the

FIGS. 5, 6 AND 7.—THE GRINNELL SPRINKLER.

side of the opening in a box with glass front, the glass being broken as in the case of an ordinary fire alarm. The shutters were supplied by Messrs. Arthur E. Gibson and Co.

Sprinkler System.

A very elaborate and complete system of automatic sprinklers of the "Grinnell" type was installed in the building by Messrs. Mather and Platt, which firm also were sub-contractors for the hydrant system. A main feature of this installation is that the piping is enclosed in the floor construction, and is not visible from below, only the sprinkler head projecting below the ceiling.

In case of fire, the hot air or the flames, when reaching the ceiling, affects the fusible joint in the sprinkler, and the valve is released, and water under great pressure is spread about the room in all directions. The system is continually charged with water; and should any sprinklers "go off" and water be discharged, additional water is pumped into the system automatically. About 2,800 sprinklers, connected together by about 64,000ft. of piping of different diameters, varying from 1in. for three sprinklers and 6ins. for over 150 sprinklers, form the system, together with pressure tanks, injectors, main valves, pressure indicators, fire brigade street connections, etc. Three sprinklers are provided in each panel between girders, size 12ft. by 24ft.

Quite a network of pipes is placed on top of the reinforced concrete floor, and embedded in concrete. These pipes are fed by rising mains running from basement to roof. Stop valves are placed on the mains to allow of the water being shut off after a fire when sprinklers have been acting and are to be closed again.

In the sub-basement are placed two pressure tanks for storage of water, each tank being 6ft. in diameter by 30ft. long, and containing one-third water and two-thirds air.

There are three sources of supply of water, (1) high pressure town main in Somerset Street; (2) low pressure main in Oxford Street; (3) storage tanks in sub-basement.

The water is forced from the water main into the piping system and the storage tanks by means of hydraulic injectors placed in the third basement. The fact that two-thirds of the volume of the pressure tanks is air permits the quantity of water in the tanks to be changed by slightly increasing or reducing the pressure of the air. Non-return valves placed on the supply pipes from the town main prevent any water returning to the main.

The horizontal main supply pipes are laid in the ventilation trenches under the basement or sub-basement floor. The risers are placed in the lift-shafts. The entire system has been tested with a water pressure of at least 150lbs. per sq. inch. Pressure gauges on storage tanks and main supply pipes indicate the pressure of water, and a water gauge shows the water level in the storage tanks.

The whole system is regularly inspected, and the pressure of the air is regulated by a small air compressor driven by an electric motor.

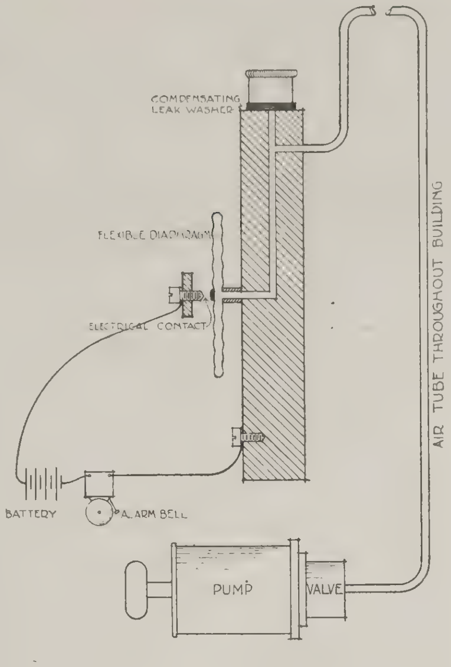
Fire Hydrants.

The building is provided with 36 double fire-hydrants, placed at each floor level in the staircases. Three coils of hose and two branch pipes, with necessary couplings and spanners, are hung in recesses enclosed with glass doors. In all, about 6,650ft. run of 2⅜in. diameter hose is provided.

The supply of water is similar to that for the sprinkler system, and the pressure is raised automatically by means of injectors driven by hydraulic power. The injector is placed in the third basement, and the pipes and valves are so arranged that any of the water supplies can be coupled to the sprinkler system or the hydrant system.

In addition to the above-mentioned supplies from town mains, five fire brigade hose connections are provided under the basement in Oxford Street, Duke Street, and Somerset Street, to enable the Fire Brigade to pump in water by the fire engines into the building's own hydrant system. Three hundred water-buckets, with fixed leads, and fifty chemical fire extinguishers, holding two gallons each, are also provided.

Messrs. Mather and Platt, and the general contractors (the Waring and White Co.) have co-operated in preparing the plans for the piping and machinery.



OUTLINE DIAGRAM OF AERO FIRE ALARM

Very complete and accurate plans were prepared before the erection of the building was done; and although an exceptional amount of piping had to be erected in a short time, the results have been exceedingly satisfactory.

It may serve as an indication of the systematic thoroughness with which the work has been carried out to mention that the position of every sprinkler (nearly 3,000) was dimensioned on the plans. When the concrete floors were being made, holes were left in them for the sprinkler drop pipes. Thus the necessity for extra work in cutting was avoided, as well as the risk of weakening the floor.

In a subsequent issue further details will be given of floor construction and steelwork, heating, ventilation, and water supply.

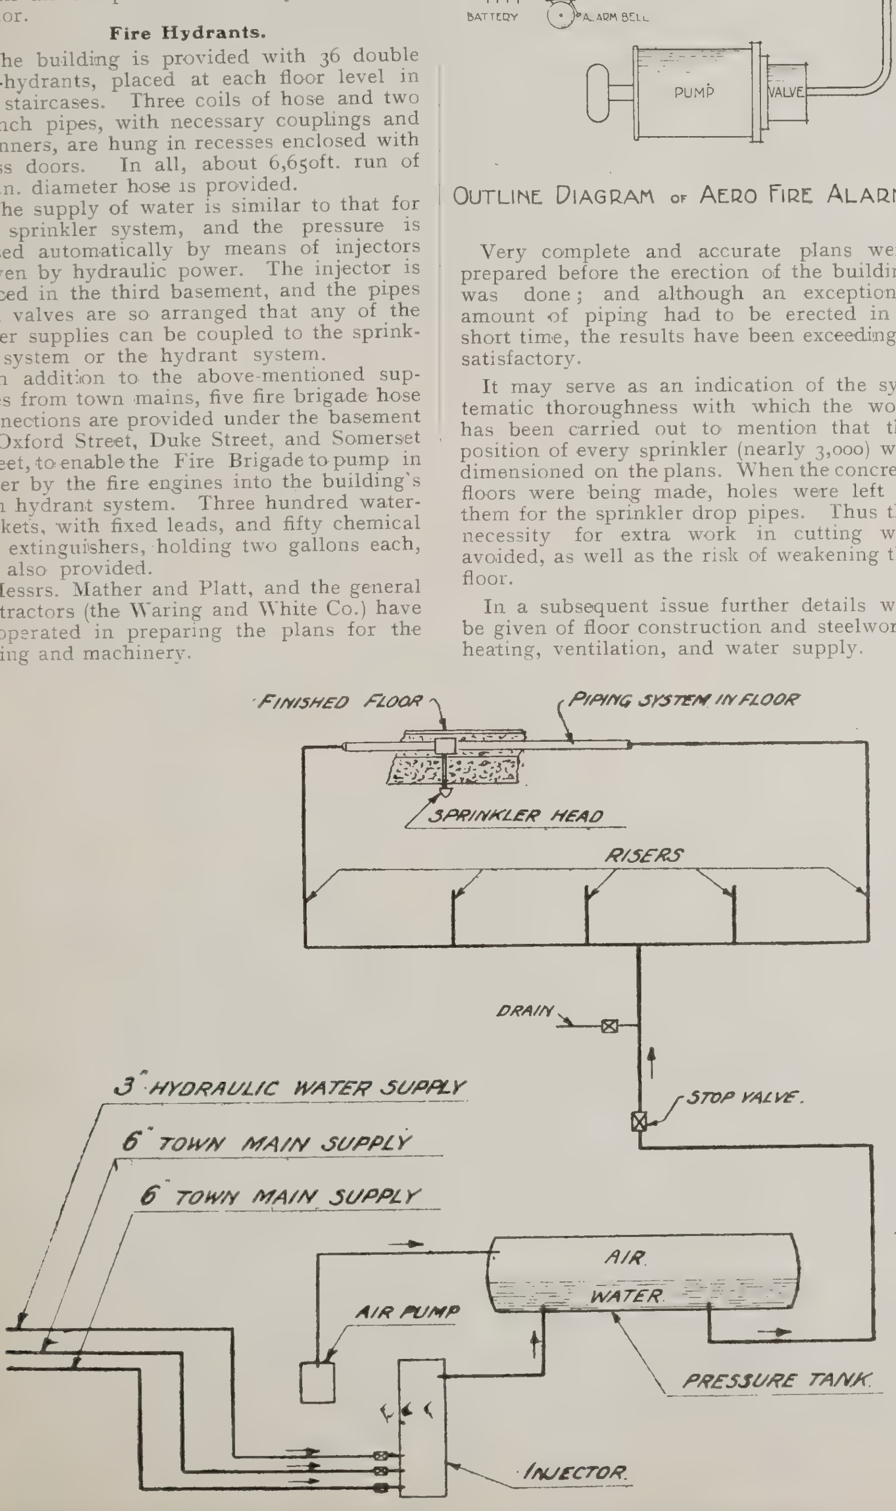


DIAGRAM OF SPRINKLER SYSTEM AT THE SELFRIDGE STORES.

Fire Alarm Apparatus.

The whole building has been protected by the Aero fire alarm system. This is a new departure in fire alarm work, and consists of a small copper tube containing air at normal pressure, which is run through the various rooms and fastened up at the ceilings so as to be practically invisible. There are forty-five lengths of this tube, the ends of which go down to a central indicator board on the ground floor, where they are coupled to registering devices called detectors. A diagram of the sytem is here shown. The detectors signal any pressure generated in the tubes which rises at a more rapid rate than the heating arrangements will account for. By the simple and ingenious method of having a controlled leak in the tubing, all the ordinary heating changes are allowed to pass unnoticed; but any abnormal heat expands the air in the tubes faster than the leak can accommodate it, and the result is that a detector gives a signal. This drops an indicator showing where the fire is situated, and simultaneously rings the fire gong and sends a message to the Aero Fire Alarm Company's Call Station at 92, Queen Victoria Street, London, E.C., which turns out the Fire Brigade. By an ingenious device the whole system can be tested in a few moments. A small quantity of air is injected into each tube, slightly increasing the pressure in it and dropping the indicator. The pressure produced by this means is very much less than any fire would create; therefore, if the apparatus responds to the test, it is an absolute certainty that a fire will be caught in its incipient stages. Within the building there are over seven miles of tubing installed, and the indicator board gives forty-five distinct indications of the location of a fire, thus enabling the firemen on the premises or the Fire Brigade to go straight to the seat of the fire.

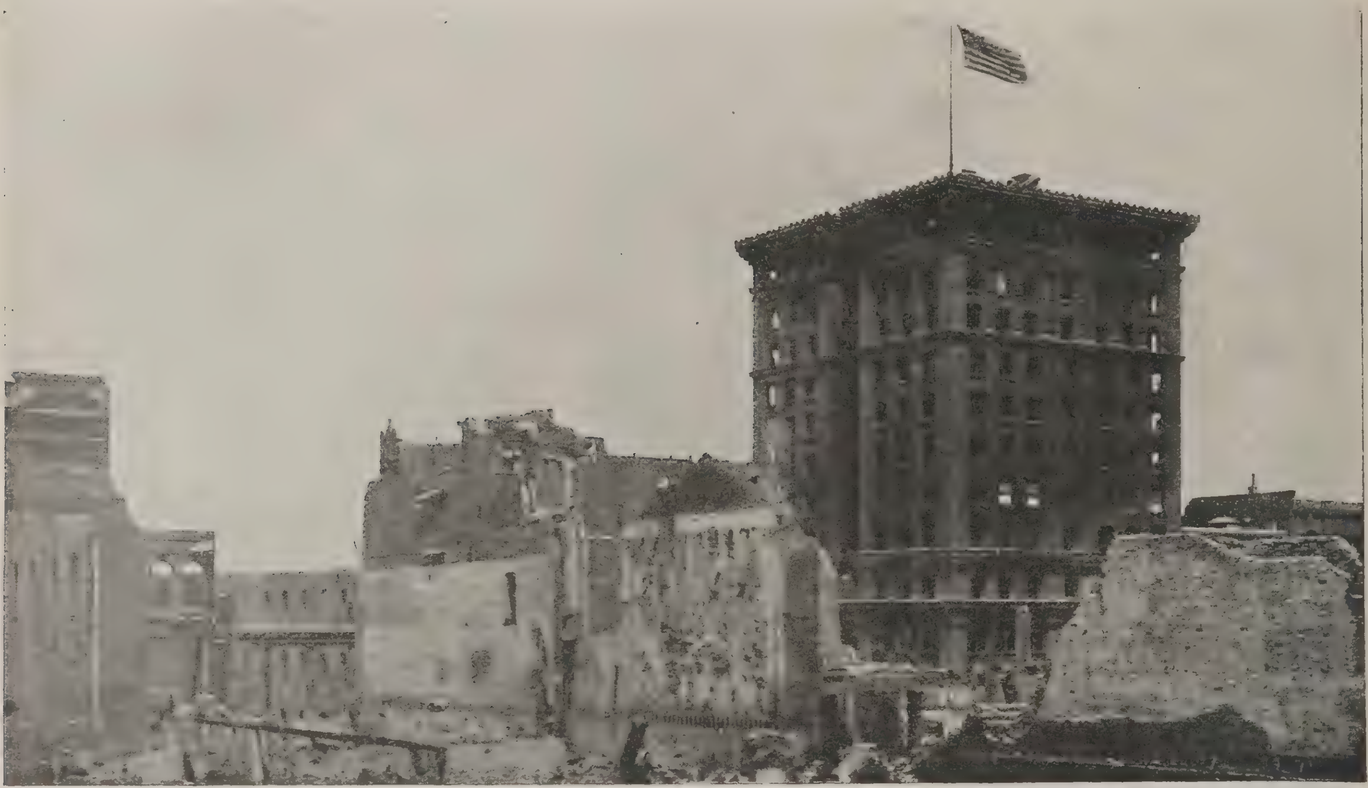
FIREPROOF STATE BUILDINGS.

The annual report submitted by Mr. Franklin B. Ware, State architect, of Albany, U.S.A., contains several references that are interesting from the British point of view, more especially with regard to questions of fire risk.

Serious consideration of the advisability of the State building its more important structures of a fireproof character is recommended; and Mr. Ware also recommends a more uniform system of selecting architects by competition for State work.

"The cost of rebuilding structures damaged or destroyed by fire during the past eight or ten years," says the report, "has been over $1,000,000, and but a small proportion of this amount was covered by insurance. The cost of fireproof buildings will exceed the cost of non-fireproof structures by about 20 per cent. The cost of maintenance on buildings at the various State institutions, due to ordinary wear and tear and deterioration, is considerable, and much of this expense might be saved by adopting fireproof construction."

Regarding the question of throwing open to competition the architectural work commissioned by the State, Mr. Ware makes the following observations, which are not altogether without relevancy to practice in this country: "Should the State contemplate providing for the selection of architects by competition for State work, when the circumstances warrant, a general law should be passed containing the provisions that all competitions shall be held only when recommended by the State architect, with the approval of the Governor; that the rules and regulations governing competitions should be prepared by the State architect, and that the Board of Award should be composed of men capable of passing on the architectural, as well as the practical features of the design. Practically all the best architects in the country are members of a society that has formulated a code for the conduct of competitions, and if the State expects to obtain the best service of these men by competition, the conditions should be drawn up so as not



THE "KOHL" BUILDING: TAKEN AFTER THE GREAT EARTHQUAKE AND FIRE IN SAN FRANCISCO.

to conflict with the code, except as its provisions might conflict with the State laws. The State architect should be the adviser in all matters of an architectural nature connected with State work, and his powers and duties in connection with competitions should be much greater than they have heretofore been under the laws providing for competitions in specific cases.

Mr. Ware criticises the work performed at certain institutions, as of an unsatisfactory character or begun before plans and estimates were approved.

Reference is made to the progress made on the new State Education building to be erected in Albany at a cost of over $3,000,000. Delays were caused by the discovery of extensive quicksand pockets, necessitating extra foundations.

TESTS WITH EXTINGUISHERS.

It being somewhat outside our purview to deal with extinguishers, we will only mention that reports No. 134 and No. 136, which deal with small fire extinguishers, have just been issued by the British Fire Prevention Committee. These may be useful for reference where architects have to specify extinguishers. Report No. 136 in particular should be of use to architects who have to deal with motor works, motor garages, etc., for under that report an extinguisher is dealt with which is intended to extinguish petrol fires. The appliances in this case were Danish. There was a considerable attendance at the tests, which were under the direction of a strong sub-committee, of which Mr. Percy Collins, J.P., was the directing member.

The Emigrants' Information Office desire specially to warn intending emigrants to view with great caution offers of employment in Venezuela, especially when such offers are coupled with the obligation of giving security by making an investment in the undertaking offering employment. Official information has recently been received of a considerable number of cases in which emigrants who have gone out in response to similar offers have found themselves destitute and have had to apply to a British Consul for relief.

THE KOHL BUILDING, SAN FRANCISCO.

The relationship between earthquake and fire is only too intimate; and the Messina disaster being still fresh in the memory, the subjoined account and accompanying illustration of a building that withstood the earthquake and great fire in San Francisco in April, 1906, are of timely interest. The reference is to the Kohl building, which is situated at the north-east corner of California and Montgomery Streets, San Francisco. It was designed by Mr. G. W. Percy, architect, who died shortly after the work of construction was started, when Mr. Henry H. Meyers, who had been for many years associated with Mr. Percy, and who is a member of the firm of Meyers and Ward, architects, completed the undertaking.

The building is described as "a full steel cage frame" resting on reinforced concrete piers and cantilever foundation. The steel frame consists of channel and plate columns, the spandril panels being carried on deep open girders, which extend from the top of the windows of one storey to the bottom of those in the next storey above, and provide the lateral bracing required in the frame, no gusset plates or other method of bracing being provided.

The floors are constructed of framed steel beams filled in with concrete panels about 3½ins. thick, reinforced with expanded metal. Except in the corridors, the concrete is surfaced with a trowelled cement finish, all offices having a wearing surface of English battleship linoleum cemented to the concrete.

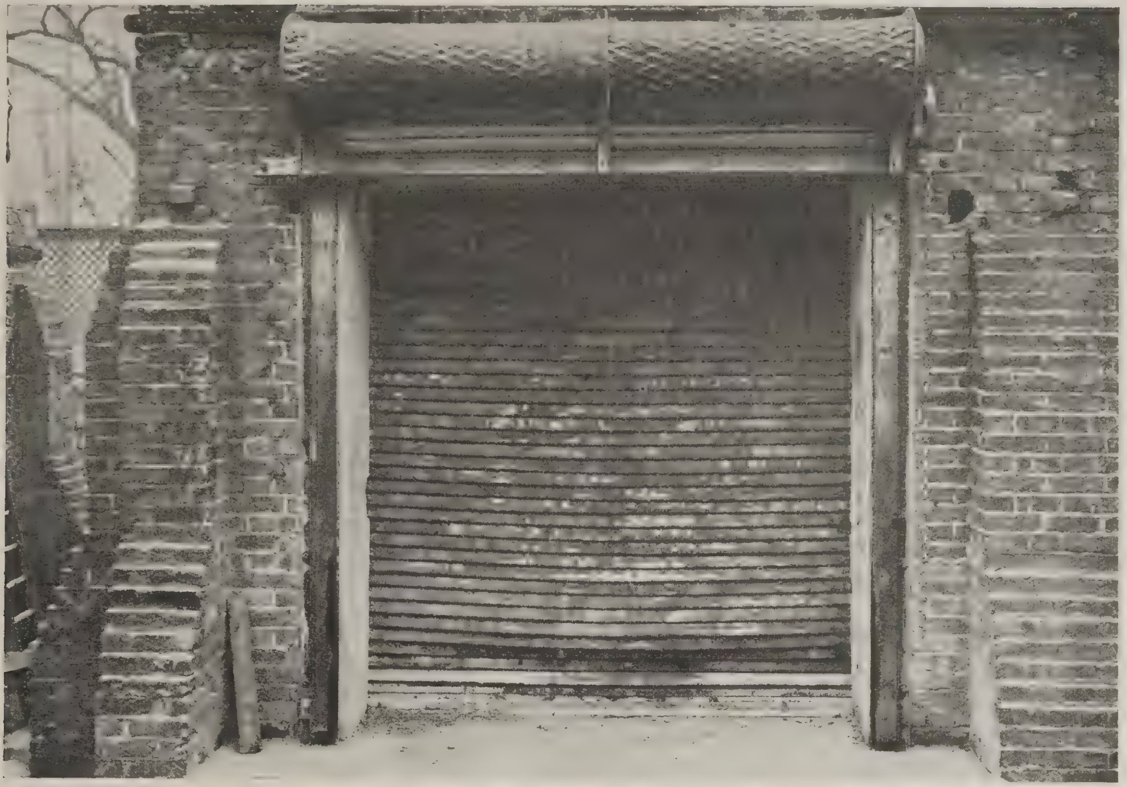
The lower flanges of all floor beams and girders were, before the floor slabs were put in, wrapped with galvanised wire netting of ½-in. mesh, secured in place by the concrete floors extending down to the lower flanges of the beams. This netting was then plastered 1-in. thick with a rich cement mortar containing a liberal quantity of asbestos fibre. Under these beams were then suspended ¾-in. steel channels about 12ins. apart, to which expanded metal lathing was wired, and this was plastered with a material made from the same formula as the English granite plaster. The interior columns are surrounded with ¾-in. steel channel studs and expanded metal lathing, which is plastered with the above-mentioned asbestos mortar. The columns are then again surrounded with steel studs, and lathed and plastered as before described. In this way is produced a double air-space that is assumed to be of great value for fire protection.

The interior partitions of the building were constructed with steel studs about 2½ins. in width, and about 12ins. on centres, and then lathed with expanded metal and plastered with the American hard wall plaster. Other partitions, dividing the offices, were constructed solid, 2ins. thick, of hard wall plaster on metal studs, and expanded metal lathing, this form of partition being identical with the granite plaster 2-in. partition erected by the Granite Silicon Plaster Co., in England.

The exterior walls are of brick, faced on the street fronts with Colusa sandstone. The roof is constructed with concrete slabs, similarly to the floors, with the addition of felt and asphaltum.

Fire reached several rooms (mainly in the four lower storeys) of the building through the breaking of the windows by the extreme heat, and burnt out everything in the shape of furniture. But beyond this there was nothing to burn, and so the building escaped destruction. It is suggested by Mr. William Ward, chairman of the Granite Silicon Plaster Co., Ltd., 36, King's Road, St. Pancras, to whom we are indebted for the foregoing particulars and the accompanying illustration, that the building might have enjoyed complete immunity if the windows had been constructed with metal frames and filled with wired plate glass. As it was, it passed through the ordeal very creditably, as the damage to it did not exceed £100, and mainly consisted of the loosening of marble wainscoting in the corridors.

The illustration brings into striking contrast the relative values of the special system of construction adopted in the Kohl building, and of the ordinary type of buildings by which (or, rather by the ruins of which) it is surrounded. Whether or not the Kohl building experienced the full force of the earthquake is, perhaps, not certainly known; but, in any case, its remarkably sturdy endurance of the consequent fire is a sufficient vindication of the system upon which it has been constructed, and more particularly of the fire-resisting properties of the expanded metal and plaster-work.



ROLLING SHUTTER DOORS. VIEW OF INSIDE SHUTTER AFTER TEST (FROM OUTSIDE. WITH OUTER SHUTTER ROLLED UP INTO HOOD).

TESTS OF ROLLER SHUTTER DOORS.

The first report of the recent series of tests with roller shutter doors has now been issued by the British Fire Prevention Committee (publication No. 135), which deals with the test of a set of two steel rolling shutters, undertaken on November 4th, 1908, with the Wilson rolling shutter doors, made by the Wilson Manufacturing Company, whose agents are Messrs. Mountain and Gibson, Ltd., of Bury, Lancashire.

The importance of the roller door question cannot be over-rated; for by means of such doors it is now possible to provide buildings with convenient means of closing them off in compartments, where large openings have to be protected.

The matter has assumed increased importance to the metropolis since the new Building Act allows for larger and more numerous compartments than heretofore to be separated from one another by walls having openings of larger area than were formerly permitted. The result will be not only the erection of a large number of new buildings of greater cubic extent, with numerous compartments so separated off, but (it may be confidently expected) quite a number of shopkeepers will be gradually joining up their various shops, and providing communications of a larger and more adequate type than was formerly the custom, when only small doors were admissible.

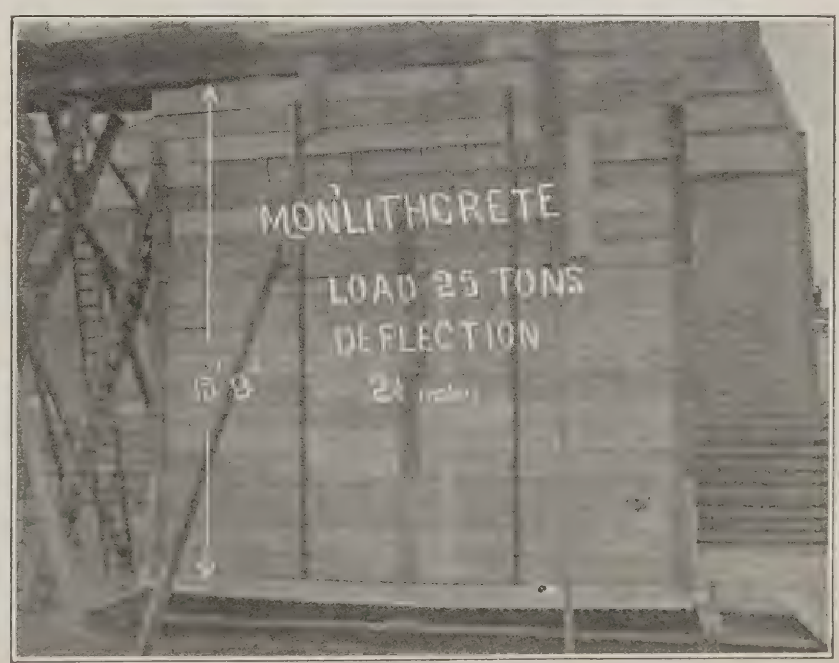
The tests with these double rolling shutter doors, as also with other doors that have been recently undertaken, are naturally receiving very great attention, and practically all the heads of the Government Departments concerned have been present at them in rotation.

At the tests here reported upon, the Council of the British Fire Prevention Committee was represented by Sir Henry Tanner, I.S.O., F.R.I.B.A., principal architect to H.M. Office of Works, and among others attending was Colonel Sir E. Raban, K.C.B., the Director of Works at the Admiralty. The Executive of the British Fire Prevention Committee was represented by Mr. Edwin O. Sachs, F.R.S.Ed., and there was a testing sub-committee in charge of the operations, which comprised Mr. Max Clarke, F.R.I.B.A., as directing member, with Messrs. Ellis Marsland (district surveyor), W. Grellier (district surveyor), M. Garbutt, F.R.I.B.A.; E. J. A. Fulkes (insurance surveyor); Mr. Percy Collins, J.P., and Chief Officers R. W. Henderson, J.P., and J. H. Dyer, both of the National Fire Brigades Union.

In the preliminary note to the report, Mr. Max Clarke, as the directing member, impresses upon the users of roller shutters the necessity of seeing to the proper fixing of the doors, a point frequently overlooked when getting estimates. We certainly desire to endorse Mr. Clarke's views on this important point.

The test in question was undertaken with a view to obtaining the highest classification —*i.e.*, full protection, Class B, which is the same classification for which reinforced concrete floors are generally entered. In a manner, the idea was to prove that, given a floor that was fully protective—*i.e.*, that has withstood four hours' severe fire—it was also possible to protect the vertical openings for the same period and under the same conditions. The double doors in question obtained their classification.

The double-door test under notice may, in a manner, be deemed to be a record; for not only did the doors withstand the four hours' continuous temperature, rising to over 1,800 degrees Fahr., followed by the application of water, but they withstood that strain particularly well, and a photograph goes to show that one of the two doors could also be slid up—*i.e.*, worked after test.



THE MON'LITHCRETE TEST.

View of the Mon'lithcrete floor slab after the test described in our issues of Feb. 17th and 24th. The system is that of The Fawcett Construction Co., Ltd.

A NEW TEST FOR CONCRETE.*

By J. S. Owens, B.A., M.D., A.M.Inst.C.E. etc.

It is customary in specifications for works in which concrete is used to state clearly the tests which the cement must satisfy. Similarly the exact nature and proportions of the aggregate are laid down, and the method of mixing which is to be used. It will therefore be seen that, while the nature of the actual material is clearly specified in the case of each of the separate ingredients to be used, only the method of arriving at a certain result is specified in the case of the concrete itself. In other words, while the nature and quantity of each ingredient are carefully specified, the quality of the resulting concrete, which depends upon thorough mixing, is not thereby assured.

It therefore appears that there is here a weakness in our specifications which may entirely nullify the effects of the care otherwise displayed in drawing them up. Reasoning along such lines as these the author was led to devote his attention to devising a test which could be applied to concrete on the works; and which would enable the engineer to satisfy himself that the mixing was being carried out efficiently.

The methods of determining when concrete has been properly mixed, which have been used up to the present, are as follows:—Inspection of the mass. This is at best only a very crude method, and, as will be shown in this paper, ineffective. It is impossible by inspection alone to tell the difference in the appearance of concrete composed of one part of cement to two of ballast, and concrete having one part of cement to three of ballast. The even distribution of the water can, however, be easily recognised by inspection alone, owing to the uniform stiffness of the mass.

Another method, which is sound in principle, is to make briquettes of the concrete and break them after say seven days; thorough mixing will be indicated by uniformity of breaking stress. This can hardly be regarded as a works test, and suffers from the drawback that considerable time must elapse before the result is known. It would be difficult, for example, for a clerk of works to suspend concreting operations for the week or so necessary to get a result by this means.

Again, pigment has been added to the concrete, to test the mixing. Briquettes were made, allowed to set, and broken; the fractured surfaces being examined for even distribution of the pigment. This is very ingenious, but clearly is not applicable to testing concrete on the works; where pigment could not be added. It has also the same disadvantage as the previous test, in addition to the difficulty of telling by mere inspection whether the pigment is evenly mixed with the concrete.

When Mr. Taylor was designing his well-known concrete mixer, he adopted a novel method of testing it. The drum of the mixer was made of glass, and layers of coloured beads were placed in the bottom. He then noted the number of revolutions necessary to mix the beads until there were as many of one colour as of another in a given area of surface. This method is of course useless for concrete, nor indeed could the beads give any indication as to the amount of mixing which concrete would require. Probably the only use to which it could be put would be to compare the relative mixing power of different arrangements of drum or deflectors.

In the author's opinion, too little attention has been given to the question of concrete mixing, especially in view of the enormous strides which have been made of recent years in the application of concrete reinforced with steel. Not only is there more concrete used now than there was some years ago, but the protection of the steel reinforcements calls for a greater exercise of care in the making.

Perhaps the simplest definition of properly mixed concrete would be:—Concrete in which the various ingredients are as uniformly distributed as the size of the particles composing them will admit. Until this uniformity of distribution has been attained, the mixing process must be regarded as incomplete. On the other hand, when a uniform mortar has been formed of the sand, cement, and water, and the particles of stone or gravel have been spread evenly through this mortar, we may say that mixture is complete. The question, therefore, is how to determine when this uniformity of distribution has been attained.

If we take a few small samples from different parts of a heap of concrete, and if we can tell in some simple way whether all the samples contain the same relative proportions of stone, sand, and cement, we have a means of telling whether the concrete is properly mixed or not. When the mixture is complete, all the samples will, if of the same size, contain the same amount of the respective ingredients.

A knowledge of the different rates of settlement, in water, of materials composed of different sized particles, of the same sp. gr., suggested that this peculiarity might be utilised to separate rapidly the ingredients composing concrete; and a series of experiments, the results of which are given in this paper, was undertaken to determine the practical value of the method.

It was found that when a sample of concrete, freshly mixed, was placed in a tall, narrow glass vessel nearly full of water, and shaken up, on standing, the cement, sand, and stone, settled at very different rates. The large stone collected at the bottom; over them, and clearly defined, came a layer of sand; and over the sand the layer of cement; the lines of demarcation being perfectly distinct. The next question was to determine whether the thickness of these layers was directly proportional to the amount of material present in the sample; if so, here was a method of telling at once whether each sample contained the same proportions. It was not essential to know the exact amount of material present in each layer, but simply whether the relative proportions were the same in each sample.

The success of this method of separation depends on the fact that the rate of settlement of particles in water, if of the same specific gravity, is governed by their size. To bring out the difference in the rate of settlement, a tall vessel is necessary, since the object is to make the time interval between the arrival of the various sized particles at the bottom as great as possible.

For particles over 0.0039 in. in diameter, the velocity of fall in water is given by the following formula:—

Where v represents the velocity in ft. per sec.
d represents the diameter of particle in ft.
s represents the sp. gr. of the particle.

then v is equal to $4{\cdot}3\sqrt{d(s-1)}$

This is the law which governs the settlement of the sand; that is, the velocity of descent varies as the square root of the diameter of the grain. When, however, the diameter falls below 0.0039 in., the viscosity of the liquid controls the rate of settlement; and it then varies as the square of the diameter.

The British Standard Specification for cement states that it must not give a residue exceeding 18 per cent. on a sieve having 32,400 meshes per square inch. These meshes are 1-180 of an inch square, and the wire forming the sieve is 0.002 of an inch in diameter; 1-180 of an inch is approximately 0.0056, and if we deduct from this the diameter of the wire, 0.002, it gives us 0.0036 of an inch as the size of the actual openings, and hence of the largest grain which will pass through. Particles of cement are therefore usually under 0.0039 of an inch in diameter, and consequently do not even obey the same law which governs the deposit of sand. For example: in a tube 18 inches high and 1 inch diameter, the settlement of the sand, even the finest particles, was complete in about 10 seconds, whereas the cement took 5 to 10 minutes to deposit; thus the sand sank over 30 times as fast as the cement.

The way in which the concrete deposits in the test glass is curious. On shaking up a sample with water in a tube and placing to settle, the large particles of gravel sank to the bottom immediately, to be followed by the sand in five or ten seconds, but the cement behaved in a different way. The first effect was always a clearing of the top of the water, and the formation of an ill-defined, cloudy line of junction between the clear water and that containing the cement. In perhaps five minutes this line of junction, which was descending slowly, altered in appearance almost suddenly, and showed a clear, well defined surface. On measuring the depth of the layer of cement at this stage it was found that it was still shrinking very slowly; but when measured at intervals of two or three minutes it was noticed that after a short time, perhaps 10 or 15 minutes, a minimum thickness was reached, and no further contraction took place. This was clearly the time at which to take a final measurement, and it was found that the thickness of the layer depended, other things being equal, on the amount of cement present in the sample. Provided therefore, that the minimum thickness of cement layer is taken, it is not essential that the time of settlement should be exactly the same, when it is desired to compare two samples.

It was found, however, that the thickness of the cement layer depended somewhat on the time which had elapsed since wetting; and in tubes which had been allowed to settle and then shaken up again, each time that this was repeated gave a thicker layer of sediment than before; owing doubtless to the reaction between the cement and water. It is therefore clear that comparison as to the amount of cement present can only be made by this method when the samples are from the same mixing. A few minutes' more exposure in one sample than in another will, however, make little difference.

The effect of the thickening of the layer of sediment appears to depend somewhat also on the nature of the cement used, some cements being more sensitive than others in this respect. If the process of shaking up and standing be repeated often enough, the surface will eventually fail to become sharp, however long the test glass may stand; the sediment will become flocculent, and the surface ill defined.

If too small a quantity of water be used to shake up the concrete with, another error of some importance is introduced. When the tube is placed to settle, the sand and gravel at the bottom entangle a certain amount of cement, and the less the quantity of water used the more cement will be thus entangled, owing to the mixture of cement and water being more concentrated. When the total height of the column of water and concrete was about twice that of the concrete alone, the amount entangled in the sand was about 35 per cent.; when, however, a water column of about four times the height of the concrete in the tube was used the amount of cement caught in the sand layer was negligible.

A curious effect was noticed when the tubes were placed to settle exposed to sunlight. The layer of cement on settlement was not level, but inclined downwards from the sunny side. The cause of this was that in each tube an ascending current was formed on the sunny side and a descending one on the other, the change of direction occurring on the bottom, over the surface of the cement layer, where a distinct current setting towards the sunny side therefore existed; and this carried the suspended particles with it and piled them up on that side. The direction of the currents could be seen from the movements of these particles, and the amount of tilting of the layer amounted to about one in ten.

---

*Abstract of a paper read by J. S. Owens, B.A., M.D., A.M.Inst.C.E., etc., before the Society of Engineers, March 1st, 1909.

A series of experiments bearing on the evolution of the test was then described, and tables showing the results were given.

Passing on now to the application of the test in practice, the author said that the strength of concrete depends practically entirely upon that of the mortar which cements the larger particles of stone together. That being so, we may look at the question of proportions in this way:—The ratio of cement to sand used will be determined by the strength of the concrete required, and the amount of coarser particles of stone or gravel which may be added will be the largest quantity which permits of complete separation of the individual particles by the mortar. In other words, there must be a little more mortar than will completely fill the voids in the stone or gravel; and any increase over the amount necessary to do this does not mean an improvement in the strength or impermeability of the concrete. We come therefore to the conclusion that it is the mortar which, other things being equal, determines the strength of the concrete.

Now it is a well-known fact that to mix mortar effectively requires more work than to mix concrete containing coarser particles. A mixer which is working on cement mortar cannot turn out so great a quantity as when the machine is working on concrete. It is therefore obvious that if, when mixing concrete, it can be shown that the sand and cement are thoroughly mixed together, we may feel sure that the coarser particles are properly distributed throughout the mass. The importance of this is that it removes a difficulty in the practical carrying out of the test, since it is unnecessary to measure the amount of coarse particles of stone in a sample if we can measure the sand and cement. If therefore the samples contain slightly different amounts of mortar, as may happen if we include the coarse particles in taking them, this will not affect a conclusion drawn from the relative amount of sand and cement present in each. Again we may entirely remove the stones from our sample, as is convenient in dealing with concrete having a coarse aggregate, and test the mortar only, knowing that if it is well mixed the concrete is well mixed.

It is desirable that the samples taken for the purpose of the test should be of the same volume, as nearly as possible, although it is not essential that they should be exactly the same, since the only thing necessary to show that a perfectly uniform mixture has been attained is that the ratio of the thickness of the sand to the cement layer should be the same for each sample. It is difficult, with a material such as concrete, to fill a small measure so as to be certain that each time you have exactly the same volume of mortar present; since the inclusion of a large stone more or less may make a difference in the amount of mortar contained. It would therefore be impossible to be certain that a slight inequality in the actual thickness of sand and cement in one sample, as compared with sand and cement respectively in the other, meant that mixing was incomplete. We can, however, be sure that inequality in the ratio of sand to cement in one to the same ratio in the other means incomplete mixture; and conversely, that equality of these ratios means complete mixture.

In making an actual test of concrete, although the entire sample may be placed in the test glass and shaken with water, it was found preferable to separate out the coarse particles of stone before applying the settlement test. When the aggregate contains stones up to two inches in diameter there is danger of breaking the glass in introducing the sample and shaking it; and further, the glass becomes cumbersome owing to the large size required. Again, although the large stones sink to the bottom before the sand, unless there is enough sand in the sample to entirely fill the voids between the stones, it does not settle with a clearly defined upper surface, but trickles down between the stones, and leaves an irregular surface on the top.

TABLE A.

Time Required to Empty Feed Hopper into Drum.	Time of Mixing after Whole Charge was in Drum.	Thickness of Layers.				Ratio $\frac{S}{C}$	Ratio $\frac{S}{C}$	Time of Discharge.
		Sand.		Cement.				
		Tube 1.	Tube 2.	Tube 1.	Tube 2.	Tube 1.	Tube 2.	
Seconds.	Seconds.							
30	—	1.2	1.2	2.0	2.2	0.60	0.55	Six seconds per barrow, or one-third of a charge.
20	10	1.0	1.0	1.7	1.9	0.59	0.53	
25	20	1.3	1.3	1.9	1.9	0.68	0.68	
30	30	1.0	1.0	1.8	1.8	0.55	0.55	
25	35	1.4	1.4	1.9	1.9	0.74	0.74	

The method adopted in the case of concrete having stones up to ¾ inch in diameter was as follows:—Two test glasses were used, having a diameter of 1.5 inch and a height of 13 inches; a funnel fitting into the top of the glasses was provided, and a conical wire screen fitting into the funnel; the screen had meshes about one-twelfth of an inch square, or 144 to the square inch. Two samples were taken in a small tin measure, containing 6.2 cubic inches, each being taken from a different part of the heap of concrete under test. The funnel with its screen having been placed over a test glass, a sample was emptied into the funnel, care being taken to wash out the last particle from the measure. A small stream of water was then allowed to trickle through the concrete, which was stirred vigorously meanwhile, with the result that all the cement and fine sand were washed through the wire screen into the test glass, and in about a minute the coarse stones were left perfectly clean in the funnel. These were thrown away, or retained for measurement if desired; and the test glass, having been filled to within about an inch of the top with water, was shaken up and placed to settle. The sand commenced to fall immediately, and was all down in a few seconds, leaving the cement in suspension in the water. The cement then gradually settled down, and in about 10 minutes reached a layer of minimum thickness. The depth of the sand and cement in each glass was then measured.

In testing concrete having stones up to two inches in diameter it is best, as suggested before, to remove the large stones from the sample, and use only the mortar for the test.

The test as described may be applied to determine whether concrete contains the specified proportions or not; it will, however, be better, as a rule, to determine this from a measurement of the gauge boxes combined with a mixing test. A fair idea on this point may be obtained as follows:—Prepare a sample of concrete having the specified proportions, and mix thoroughly, taking care that it is made from the same materials and wet at the same time as the concrete it is desired to test the proportions of. A sample of the latter may then be tested against the specially prepared sample, and if the sand and cement differ materially in each, we may infer that there is a difference also in the proportions present. It is difficult, however, in a small sample to tell much about the proportion of stone or gravel present; and it must be noted that for the purpose of testing the mixing, the smaller the sample which can be conveniently used the more accurate is the result; whereas in dealing with the proportions, the larger the sample the better. In the example which follows, each test was made with a different charge of materials in the machine, and it will be observed that the sand and cement layers differ materially in thickness in the different samples, showing that the proportions were not being accurately maintained. The chief cause of this lay in the measurement of the sand, which was somewhat falsified by the fact that the proportion present in the ballast used varied.

Up to the present the test has been applied practically to only one concrete mixer, and particulars of this are given. No attempt is made here to compare this machine with others on the market, but the results are given because they bring out one of the uses to which such a test may be applied.

The machine tested was in operation preparing concrete for a large ferro-concrete building. This machine was of the rotary drum type, and had fixed on the internal surface of the drum a peculiar arrangement of deflectors, which had the double effect of ploughing through the material lying on the bottom of the drum and of lifting part of it to the top, from where it was discharged as a shower on that below. A fixed hopper was provided, which received the dry materials, and discharged them into the mixing drum, when a gate connecting the hopper and drum was opened. Water was supplied when the hopper had emptied, the whole operation going on while the machine was running. The discharge was into wheelbarrows, three of which were required to one charge. Only one man was employed attending to the machine. The drum had a capacity of 5 cub. ft. and ran at 18 revs. per min., the output as per maker's list was 50 yds. cub. per 10 hrs.

The concrete was composed of gravel 4, sand 2 cub. ft. and 100 lbs. of cement. The largest particle of gravel would pass a ¾ inch ring. The method of carrying out the test was as just described, and the results were as shown in Table A.

The mixture in this case was uniform 20 seconds after the charge was in the drum. It must, however, be noted that the feed hopper took an average of 26 seconds to empty, during which time the mixing of that part of the charge which had entered the drum was going on. Putting the time of discharge as 20 seconds, it will be seen that the whole operation of feeding, mixing, and discharging need occupy only 66 seconds. This is assuming that discharge takes place as soon as the mixture is complete; but this was not the case in the present instance, since the concrete could not be used as fast as the machine could turn it out. If worked to its full capacity, it could therefore mix 101 yds. c. in 10 hrs., which is double the amount it was rated for. It is obvious, however, that it would be impossible for one man to feed 101 yds. to the machine in 10 hours; hence to get the maximum capacity more attendants would be required.

(To be continued.)

A Rubens Museum is in contemplation by the city of Antwerp. It is to be lodged at No. 7, Rubens Street, a house built by the Flemish master.

Major Lewis Henry Isaacs, of Verulam Buildings, Gray's Inn, W.C., architect and surveyor, formerly Conservative M.P. for the Walworth Division, for 42 years surveyor to the Holborn Board of Works, who died on October 17th, aged 78, left estate of the gross value of £49,627 7s. 4d., of which the net personalty has been sworn at £40,993 18s.

In Parliament.

The Queen Victoria Memorial.

In the House of Commons last week, Mr. Ellis asked the First Commissioner of Works when it was expected that the memorial to Queen Victoria opposite Buckingham Palace would be completed; and, having regard to the desirability of this on many grounds, whether the approaching fine weather and longer hours of daylight would be utilised to the fullest extent for the purpose of pressing on the work.

Mr. Harcourt, in reply, said: I cannot yet fix a date; everything depends upon the rate of progress of the sculpture and the rapidity with which it can be placed in position. Every effort is being made, and will continue to be made, to press on the work.

The Facing of Ferro-Concrete.

Mr. H. C. Lea asked the First Commissioner of Works whether he was aware that in the new Post Office buildings in the City being built in ferro-concrete, only one coat of Portland cement facing was being applied; whether he was satisfied that this was sufficient to finish the exterior rough surfaces of the ferro-concrete, especially in running mouldings, as it was not recognised by architects and the plastering trade, two coats always having been considered the minimum; and also whether one coat was in the specification of the architect to the new Post Office buildings.

Mr. Harcourt, in reply, said:—The work is being done in accordance with the specification, and is considered by many architects to be the most satisfactory treatment of concrete.

To another question as to whether a deputation would be received from the men, Mr. Harcourt said he had received deputations previously over buildings for the Post Office. He would be glad to receive any information which Mr. Lea or any other honourable member might wish to submit to him in writing.

Re-erection of Buildings in Jamaica.

Mr. Watson Rutherford asked the Under-Secretary of State for the Colonies whether the delay of over two years since the earthquake in re-erecting the Government buildings in Kingston, Jamaica, had been caused by some valid reason; and, if so, what reason; whether something could be done to expedite this work; and whether his Department had been or were endeavouring to help forward the work by assistance, either in advice or financially.

Col, Seely, in reply, said a contract for the reconstruction of the Government buildings at Kingston had been executed, under which King's House had to be completed by April 4th, 1910, and the Post Office and Treasury by May 31st, 1910. The Secretary of State had no reason to think that there had been any avoidable delay in carrying through this matter, having regard to the precautions necessary to provide buildings capable of withstanding earthquake shocks. The Governor of the Colony paid a special visit to England last year in connection with the matter, and his efforts had received full support from the Colonial Office.

New Post Office for Bolton.

Mr. Buxton, the Postmaster-General, has informed Mr. Tyson Wilson that the question of the erection of a new post office at Bolton has been attended with various difficulties, and the plans are not yet settled. He is not yet in a position to say when building operations can be begun.

Accidents and Lead Poisoning.

In a Home Office table relating to accidents, industrial poisoning, and dangerous occurrences in the United Kingdom during the year 1908, it is stated that 239 cases of lead poisoning were reported among house painters and plumbers, not employed under the Factory and Workshop Acts. There were 44 fatal lead-poisoning cases during the year in these two classes. The number of fatal accidents in the construction of buildings was 114, as compared with 127 in 1907.

Trade and Craft.

Test of Reinforced Brickwork.

An interesting test of the "H.B." system of reinforcement, in which the brickwork is strengthened by means of wire-mesh reinforcement was recently made in Liverpool, in the presence of leading architects, surveyors, and representatives of the Press, by Messrs. Richard Johnson, Clapham, and Morris, Ltd., of 24 and 26, Lever Street, Manchester. For the purposes of the test a hollow storm wall was built, consisting of an outer wall of 4½in., a cavity of 1½in., and an inner wall of 3in., or brick-on-edge, making together a 9-in. cavity wall. Between two piers, 10ft. apart, was built a length of wall of this description, about 3ft. high, and about 3ft. above the ground—that is, the wall did not rest on the ground, but had beneath it about 3ft. of clear way between the piers, into which it was built on both sides. On the other side of one of the piers was a similar piece of walling, 5ft. long, supported cantileverwise—that is, at one end only. Common red bricks were used, and the mortar consisted of three parts sand to one part cement. The joints were reinforced in every course on the "H.B." system, the wire-mesh reinforcement being carried through the entire length of the wall and piers. There were no ties of any kind between the inner and outer walls. The brickwork having been allowed thirty-five clear days for setting, the test was begun by loading the span between the piers with 10,000lbs., and the cantilever portion with 5,040lbs. These loads remained in position for a clear day, when, on examination, no deflection was apparent. It was then decided not to increase the load on the centre span, but to test the cantilever to destruction. The load on the latter was then increased to 8,260lbs. without any sign of deflection. On the load being increased to 10,640lbs., the cantilever broke suddenly, without having shown any tendency to crack or deflect. An examination of the fracture showed that the bricks, where built into the pier, had sheared across, and the others had sheared away at the joint. Thus the wire-mesh reinforcement bore the tension strain of the load of 10,640lbs. Finally, the bricks of the cantilever wall gave way under the excessive shearing force, the wire-mesh reinforcement being likewise cut across. In a test for lateral resistance of a 4½-in. wall, a piece of brick wall, 3ft. long, 2ft. wide, and 4½in. thick, built and reinforced similarly to the walls described in the preceding test, was loaded. Nineteen clear days for the setting of the cement having been allowed, the slab was placed across two stone flags, with a bearing of 3in. at each side, thus having a clear unsupported span of 2ft. 6in. When the load amounted to 4,256lbs., a fine shear crack was noticed in the centre of the slab at one side. At 5,600lbs., a brick (entire) fell out on the opposite side to that on which the shear crack appeared. When finally the slab failed under a load of 7,448lbs., it was found to have cracked straight across, but rather on one side, this being accounted for by the support on one side sinking a little, and so causing the weight to be deflected.

Hamilton's Patent Window Fittings.

Strength, neatness, simplicity, and cheapness are claimed for the patent window fittings that are supplied by Messrs. W. L. Hamilton and Company, Ltd., of Cornwall Buildings, Newhall Street, Birmingham, who show in a series of interesting illustrations how their fittings are applied to old or new windows, and how they operate in hingeing ordinary sashes so that they may be opened inwards for cleaning, etc., and thus prevent risk of accidents and save money in window-cleaning contracts. The hingeing apparatus consists of two brackets and two pivots for each sash. The brackets are checked into the batten rod or parting bead, and screwed to the frame of the window, making their hold perfectly secure; the pivots being screwed to the sash. A small ledge on the pivot fits underneath the flanged edge of the bracket, making it impossible to raise the sash from the hinges while it is turned into the room. When the window is being opened inwards, the face plate, passing from the slipper to which it has been locked, draws forward a sliding bolt which projects through the keeper, thus holding the cord in position while the window is swung in to be cleaned. On closing the window again, the face plate, engaging with the clipper, pushes the bolt back into its original position, and the window can then be moved up and down the full way. The fittings are neat and unobtrusive, and do not detract from the appearance of the window. These fittings have been adopted on a large number of important buildings, including the Waldorf Hotel, the "Morning Post" building, and the Prudential Assurance Offices, London; and the Edinburgh Life Assurance Co.'s head offices, and many other large buildings in Edinburgh and Glasgow, including, in the latter city, the National Bank of Scotland, the Institute of Civil Engineers, and sixteen schools under the Glasgow Board.

Coming Events.

Thursday, March 18.

The Concrete Institute.—Mr. E. P. Wells, on "Concrete Arch Bridge Construction."

Leicester and Leicestershire Society of Architects.—Mr. A. Herbert, A.R.I.B.A., on "F. W. Ordish, Architect, and an Exhibition of his Drawings."

Friday, March 19.

Birmingham Architectural Association.—Mr. G. Salway Nicol, A.R.I.B.A., on "Rome and Paris: their Architectural Relations."

Architectural Association (18, Tufton Street, S.W.).—Mr. J. A. Marshall on "A Lesson from the Past," 7.30 p.m.

Saturday, March 20.

Edinburgh Architectural Association (117, George Street).—Visit to St. Triduana'a Well, Restalrig, and to Craigentinny House.

Monday, March 22nd.

University of London (South Kensington).—Mr. Banister Fletcher, F.R.I.B.A., on English Renaissance (and Modern) Architecture," 8 p.m.

Polytechnic (Regent Street).—Mr. S. Bylander on "Constructional Steelwork for Buildings."

Wednesday, March 24.

Northern Architectural Association (Newcastle).—Annual Meeting, Exhibition of Students' Work, and Presentation of Prizes, 7.30 p.m.

Do you have to compete for a job?

or

Do employers compete for your services?

It depends, of course, on what you can do. Is your work the kind which any number of people can perform? Then, obviously, there's no reason why your services should be sought.

Are you competent to undertake positions which few can occupy because you possess **specialised training?** Then necessarily you are in demand.

The question is, then—are you a **trained** or an **untrained** man? It makes all the difference—not only between choosing the post you would like and taking the job you can get—but also between high and low pay, between security and insecurity of employment, between peace of mind and harrowing uncertainty, between success and failure in life.

Happily the sure and simple way to **become** a **trained** man is opened to you by the International Correspondence Schools which exist for the one definite purpose of qualifying ambitious workers for the best positions in their chosen lines of work.

You study with the I.C.S. at home, in your spare time, by correspondence. You make the best possible use of your leisure—you waste no time attending classes—you are on sound "salary-raising" lines every hour you are studying.

Thousands of students have testified, during the past 17 years, to the way in which I.C.S. training has improved their positions. This is just typical:—

"Leicester.

"Since commencing the Complete Architectural Course with you I have been given control of the entire office business of Messrs........................... ......Contractors and Builders, Leicester. Before enrolling I was general book-keeper and cashier in the same office. My salary has been doubled.

"(Signed) Arnold W. Kerridge."

We also assist our students in the matter of Employment by means of our

"STUDENT'S AID DEPARTMENT,"

which is in touch with employers in every district and furnishes valuable introductions, recommendations, etc. You should get full particulars of the free service.

Mark the coupon or write us about any special career—NOW. That's

THE FIRST STEP TOWARDS MAKING YOURSELF IN DEMAND.

Residents of the following Countries should address the respective I.C.S. Branches:—

Canada—Toronto.
India—Fort Bombay.
South Africa—Cape Town.
New Zealand—Wellington
Australia—Sydney.
Italy—Salerno.
China—Shanghai.
Manila—Manila, P.I.
Honolulu—Honolulu.
Panama—Ancon.
Bermuda—Hamilton.
Straits Settlements—Singapore.
Porto Rico—San Juan.
Jamaica—Kingston.
Mexico—Mexico D.F.
Argentine Republic—Buenos Ayres

Practical Notes for Architectural Draughtsmen.

By ALFRED W. S. CROSS, M.A., F.R.I.B.A.,
and ALAN E. MUNBY, M.A., A.R.I.B.A.

Complete Set (27 Large Plates in a Portfolio), 12s.

POST FREE, 12s. 6d.

Prof. C. H. REILLY, of Liverpool University, says: "I think it is a very valuable book, and I hope it will find its way into most architectural offices."

THE "PRACTICAL NOTES" gives in most convenient form for use on the drawing board examples with concise rules, explanations and dimensions for preparing Designs, Perspectives and Working Drawings for Classical Architecture with rapidity and precision.

STUDENTS preparing for the examinations of the R.I.B.A. can learn how to draw The Orders correctly with the smallest possible amount of study and work by utilising the invaluable drawings and data given in this publication.

We shall be pleased to forward a copy of this work on approval to any of our subscribers.

A LIFE EXPERIENCE **THE COLLECTOR AND BUDD'S PATENT SYSTEM.** For 5s. 2d.

COMPETITION DEMANDS SUCH A WORK AS OFFERED HERE.

THE SAFEGUARD (can be started any week, and no waiting required). **THE PRACTICAL SHORT CUT TO OFFICE ROUTINE. 50 per cent.** of clerical labour saved. Not one penny can be lost. **Book-keeping dispensed with for practical workings. "Unique."** A great money saver, and the most simple, accurate, and genuine work that can be put before the public. Thousands of copies sold, and unsolicited testimonials coming daily to hand from all over England. The work is for **Builders, Contractors, Decorators combined, or for Carpenters, Bricklayers, Plumbers, Painters, Masons as separate Businesses, Engineers, Joinery Manufacturers, etc.** And for **5s. 2d.** the key of a week of business is sent, showing contract, jobbing and day work, plant, stock, own repairs, cartage and stables, trade and office expenses, and profit and loss accounts, worked out and at a glance. Prime costs of contracts and jobbing works guaranteed to the halfpenny. **Permit grants** for use are sent with systems, and the **system is not** transferable.

ATTENTION *is called to the following. J. STEVEN CALLENDER, Builder etc., of 31, Sugarhouse Lane, Greenock. Says, I must say that I have never seen a system of bookkeeping for the building trade so seriously and carefully planned to embrace every item so that nothing may go amissing. It is exceedingly simple, and will save a good deal of office time, and only a system such as you have devised can enable the small and large contractor alike to arrive at, with ordinary care, a true statement of his position at the end of the financial year. WM. BUTTRUM, Builder and Contractor, Hillingdon, Middlesex. "I am very pleased indeed, with your system as a time saver, it is very clear and straightforward, and I thank you for introducing the system to me." All Cheques and Postal Orders to be crossed and made payable to "The Collector Office" and addressed* 19, *Henniker Gardens, East Ham, E.*

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

March 18. DERBY.—Alterations to old slaughterhouses, Cattle Market, for the corporation. Plans, etc., of John Ward, M.Inst.C.E., borough surveyor, Babington Lane, Derby, on deposit of £1 1s. Tenders by noon on March 18, to the town clerk, 15, Tenant Street, Derby.

Works in Progress and Completed.

BALLMONEY.—The church of St. James' has been re-opened after renovation that is expected to cost about £1,300. The architect was Mr. W. J. Gilliland, F.R.I.B.A., Belfast, and the work has been executed by Mr. Albert McMaster, Ballymoney.

EDINBURGH.—The contract for the erection of the new slaughter-houses at Gorgie has been awarded to Messrs. James Kinnear, Sons, and Company, Edinburgh, whose estimate is £30,608. Messrs. Kinnear state that they will complete the work in ten months. Their estimate was the lowest of fourteen offers.

ILFRACOMBE.—Work in connection with the new post office at Ilfracombe has been begun by Messrs. Woodman, of Exeter, who are the contractors. Employment has been given to local men, and the cost of the new buildings is estimated at £3,500.

WREXHAM.—The Wrexham Church Extension Committee have now accepted the tender of Messrs. W. Bowers and Co., of Hereford, to erect the Hightown Church at £6,210. The new church will be in the Early Perpendicular style. It is understood that a gentleman has intimated to the vicar his intention to defray the whole cost of this church so as to facilitate the carrying out of the entire scheme, which will require an outlay of £16,000.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ABLE architect prepares designs, perspectives, working drawings, etc., on moderate terms.—W., 6, King's Road, Kingston-on-Thames. 4918

ADVERTISER (28), seeks re-engagement, ten years' thorough practical knowledge of building, estate management, and repairs, etc.; experienced in preparing plans and estimates, including quantities, for new works: highest refs. — Y., 86, Coniston Road, Muswell Hill, N. 4805

APPOINTMENT as Improver (19), prob. R.I.B.A., just completing three years' articles with an architect and surveyor; small salary to commence; highly recommended.—H. Cullerne, "Bridge House," Lugwardine, Hereford. 4911

ARCHITECT and Surveyor's Assistant, P.A.S.I. (22), working drawings, surveying and levelling, taking off, abstracting and billing quantities, drainage and sanitation; general office routine.—George A. Taylor, Aston Road, Wem, Salop. 4892

ARCHITECT'S Assistant desires engagement, finalist R.I.B.A.; design, details, specifications, 1st class honours, quantity surveying, honours (Part 1), building construction, artistic and practical; moderate salary.—Address Architect, 24, Brunswick Street, C.-on-M., Manchester. 4871

ARCHITECT'S Assistant (23), excellent Draughtsman, desires re-engagement; London preferred; six years' first-class experience town and country work; contract, detail, and competition drawings; exhibitor Royal Academy; Prizeman for Architectural Design; small salary.—F. E., 10, Cobham Road, Kingston-on-Thames. 4876

ARCHITECT and Surveyor's Assistant (25), 9 years' experience; excellent draughtsman, working drawings, details, specifications, perspectives, surveying, French, typewriting; moderate salary.—Arthur Bailey, 26, North Street, Hailsham, Sussex. 4819

ARCHITECTS, Builders, etc., draughtsman (19), used to general work, fill up time in office; good references.—F. J. Williams, c/o F. Cundall, Architect and Surveyor, 34, Parade, Leamington Spa. 4878

ARCHITECT'S Assistant (22), six years' experience; student R.I.B.A., good draughtsman, contract drawings, details, surveying, etc.; assist with quantities; salary moderate.—J. J. S., 1, Silver Street, Stockton-on-Tees. 4888

ARCHITECT'S Assistant (27), excellent draughtsman and colourist; contract drawings, specifications, details, design, perspective, surveys, etc.; travelling studentship winner; highest refs.—Box 4902, Builders' Journal Office.

ARCHITECT'S Assistant, 23, 6 years' experience in various London offices, good references; moderate salary.—G.O.E., 72, St. Ann's Hill, Wandsworth, S.W. 4881

ARCHITECT and Surveyor's Assistant (21), seeks re-engagement; 5 years' experience in church and domestic work in larger provincial office; good draughtsman and colourist.—Box 4823, Builders' Journal Office.

ARCHITECT'S Junior Assistant (19), 4 years experience in West End Office, working drawings, details, perspectives, competitions, excellent references; salary 21s.—Box 4777, Builders' Journal Office.

ARCHITECT'S Assistant (25), R.I.B.A. exam., nine years' thorough practical experience, design, working drawings, details, specifications, estimating, quantities, levelling, perspectives, etc.; sal. moderate.—Apply, Box 4900, Builders' Journal Office.

ARCHITECT'S Assistant, thoroughly experienced, temporary employment; domestic work, business premises, schools, etc.; surveying and levelling, etc.; two years' experience in Structural Engineer's office; salary moderate. — Box 4820, Builders' Journal Office.

ARCHITECT'S Junior Assistant disengaged, 4½ years' articles, wishes to meet with architect in Lancashire office; specimen drawings, certificates for construction; sitting for Inter. R.I.B.A., June.—Apply, J. S. H., Wittington Lane, New Springs, Wigan. 4815

ASSISTANT A.R.I.B.A. (29), 14 years' London and Provincial experience; working drawings, details, specifications, supervision, perspectives, assist quantities, well up in management; testimonials; references; salary, 2 guineas.—Apply A, 31, Cotswold Road, Westcliff-on-Sea, Essex. 4775

ARCHITECT'S Junior Assistant, 5½ years' experience; disengaged; working and detail drawings, typewriting, knowledge of perspective; moderate salary.—W. L. Francis, 11, Middleton Road, Ilkley, Yorks. 4891

ARCHITECT, estate agent, or builder's assistant, experienced in all branches; good references.—R. S., Eagle House, Marine Parade, Clacton-on-Sea. 4816

ARCHITECTS, and builders, experienced surveyor open to prepare quantities and estimates, check accounts and measuring; moderate terms.—Apply Box 4817, Builders' Journal Office.

BUILDERS' Assistant desires situation; thorough knowledge plans, specifications, quantities, measuring; not afraid of work; salary not so much an object as permanent situation; 21; 5 years' experience.—Box 4839, Builders' Journal Office.

BUILDER'S Assistant or Manager; thoroughly efficient; moderate salary if prospect of hard work and exceptional ability being recognised; 23 years' experience.--Alpha, 191, Park Crescent, Grimsby. 4877

BUILDERS', Surveyors' Assistant (24), capable and reliable, seeks re-engagement, thorough practical knowledge of construction, surveying, measuring up, good draughtsman, supervision, also costs, accounts, wages, etc.; mod. sal.—Box 4841, Builders' Journal Office.

BUILDERS' Assistant desires work; plans, estimates, setting out buildings, measuring up, prime costing, surveying, and levelling plots, ordering exact quantities, materials; 11 years' experience.—Box 4803, Builders' Journal Office.

BUILDER'S or Architect's Junior Assistant (18), good tracer, well up in prime cost, and general office work; excellent references; three years' experience. — J. W., 164, Wellesley Road, Ilford, Essex. 4833

BUILDER'S Clerk and Assistant (20) requires situation; good draughtsman and colourist, certificates advanced construction, bookkeeping, typewriting and general routine; excellent references. —C. E., 59, Rosebery Gardens, Harringay, N. 4904

BUILDER'S clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4883

CARPENTER and Joiner desires sit.; bench, building or estate, or other suitable capacity; experienced; good refs.; age 30.—R. H. W., 24, Thorncroft Road, Fratton, Portsmouth. 4908

CLERK of Works seeks re-engagement; just finishing public building; varied experience, notably ferro-concrete construction; well recommended; testimonials most excellent; age 45.—A. B., Box 4814, Builders' Journal Office

DRAUGHTSMAN (junior), 5 years' experience in structural engineers, good knowledge of constructional and ornamental work, details, quantities and estimating; shop experience.—M.D., 74, Bartholomew Road, London, N.W. 4884

DRAUGHTSMAN, neat, quick tracer, working drawings from rough sketches, good colourist; shorthand, typing, etc.; about 12 years' varied experience; terms moderate.—Box No. 4889, Builders' Journal Office.

ESTATE Owners.—Bricklayer, all-round, stonewaller, and general repairs; abstainer; good references; moderate wage for permanency.—Quinton, 12, Holland Road, Aston, Birmingham. 4802

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, Builders' Journal Office.

FIRST Class Architectural Designer and Draughtsman, artistic and practical, experienced in planning; elevations and details, office and competition work; moderate salary.—Apply Box 4792, Builders' Journal Office.

FOREMAN Painter (working) seeks re-engagement); experienced in all class work in building trade, as for general alterations, etc.; good supervisor, and reliable; either town or country; abstainer.—X. Y. Z., 8, Barton Street, Westminster. 4807

GENTLEMAN, with office in Glasgow, splendid connection among architects, builders, etc., is open to represent one or two good firms; first-class references given.—Box 4893, Builders' Journal Office.

GENERAL Foreman seeks re-engagement; alterations or new, practical experience in all branches; carpenter and joiner; good references; age 36; moderate wages.—Caplen, 3, Victoria Mansion, Edgware Road, Paddington, W. 4779

GENERAL Foreman seeks re-engagement, thoroughly practical and reliable; new or alterations; carpenter and joiner; life abstainer; first-class references.—Foreman, 3, Hawbridge Road, Leytonstone. 4787

GENERAL or builder's foreman, energetic, reliable, good timekeeper, trade bricklayer; age 32. Good refs.—G. C., 44, Richmond Park Road, Kingston-on-Thames. 4863

JUNIOR Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, Builders' Journal Office.

MACHINIST seeks situation; spindle fourcutter, etc.; married, age 32; total abstainer and good timekeeper.—Machinist, 46, Priory Street, Tonbridge, Kent. 4874

PAINTING, paperhanging, distempering, graining wanted, piecework, new work at greatly reduced prices; specimen showing architects' and surveyors' testimonials for quality and cheapness.—Galton, 6, Parolles Road, Upper Holloway, N. 4861

PLASTERER, good jobbing bricklayer, roofs, fire work, stoves, tiling, etc., etc., generally useful, good reference, moderate wages, non-union.—A. Trigg, 117, St. John's Hill, Clapham Junction, S.W. 4856

QUANTITY Surveyor's Assistant (21), 4 years' experience, desires engagement, certificates and good references. — Apply Box 4745, Builders' Journal Office.

QUANTITY, General Surveyor's Junior Assistant, four years' experience; working up measuring existing buildings, good draughtsmen, little estate work; City Poly student.—J. R. O., 233, Essex Road, N. 4844

REINFORCED CONCRETE.—Details, drawings, calculations, and assistance generally, rendered to architects, builders, etc., by a specialist of large experience; terms moderate.—Box 4887, Builders' Journal Office.

SURVEYOR'S Assistant seeks re-engagement, 9 years with City firm; highest references; surveys; levels, estate management, etc.; shorthand and typewriting, if necessary. — J. P. K., 21, First Avenue, Manor Park, Essex. 4873

TO Estate Owners, builder, experience, in all trades, desires position as manager (working or otherwise); plans prepared, quantities, setting out, accounts and supervision; abstainer; country preferred.—Box 4806, Builders' Journal Office.

VOLONTAIRE.—Foreign gentleman (21) desires position in builder's office, with opportunity of learning.—B. B., 43, Bolingbroke Grove, Wandsworth Common, S.W. 4789

WORKING Foreman wants job, capable, energetic, thoroughly understands plans and setting out of buildings, etc., and taking full control of all branches; twenty years' experience; age 35; just finished job; trade, carpenter and joiner; not afraid of work; wages required, £3 per week. —Apply Box 4906, Builders' Journal Office.

Appointments Vacant.

ARTICLED Pupil—Reinforced Concrete. Required a young gentleman as articled pupil in reinforced concrete specialist's office, one with a knowledge of elementary applied mechanics, and mathematics and a taste for theory of construction and design preferred; an excellent opportunity for one willing to learn and understudy chief engineer.—Write, R. C., c/o Hastings Bros., Ltd., King's Chambers, Portugal Street, Kingsway, W.C. 4907

ARTICLED PUPIL.—Vacancy for same in old established West End firm of architects and surveyors; moderate premium; small progressive salary to suitable youth.—Box No. 4890, Builders' Journal Office.

FIRST-CLASS Architectural Assistant wanted for Lancashire; good designer, surveyor; quantities, working details; permanency to competent man; state age, salary and references to Box No. 4897, Builders' Journal Office.

MESSRS. OLIVER AND DODGSHUN, Architects, Carlisle, have a vacancy for a competent junior assistant; send particulars of age, training, qualifications, and salary required. 4901

WANTED at once, reliable clerk of works, masonry job; about 5 months, £3.—Wainwrights and Heard, Shepton Mallet. 4914

March 24, 1909. Volume 29. No. 737.

The Horse Guards' Parade. "London is a great city, but a city of lost opportunities. The eye is frequently offended, may be by a street or place with no architectural principle in its axial setting out, by some building of inappropriate design, or by the grouping of buildings without due regard to their relation to one another." With this terse but perfectly appropriate visualisation of the London of to-day, Mr. F. W. Speaight commences his introductory remarks in a well-written, well-illustrated, and well-printed *brochure*, descriptive of the proposals now before the public for the adornment of the Horse Guards' Parade and its immediate surroundings. Commenced in the year 1745, after the designs of Kent, and completed (by Vardy) eight years later, the range of buildings known as the Horse Guards' occupies the site of an old guard-house (dating from 1641), erected for the accommodation—there being then no standing army—of the "Gentlemen-Pensioners" who formed the royal guard previous to the reign of the second Charles. As to the surroundings of the buildings, with which we are more immediately concerned, according to the Hon. Mrs. Evelyn Cecil ("London Parks and Gardens"), the most brilliant days of St. James's Park began in the reign of Charles II., by whom it was entirely remodelled shortly after the Restoration. Imbued, after his many years of exile, with French tastes in art, French customs, and French proclivities in ornamental gardening, Charles is credited with having sought the aid of the famous Le Notre, the personal favourite of Louis XIV., when remodelling St. James's Park. However, although Mrs. Cecil can find no proof that the *Grand Monarque's* premier landscape gardener was ever in England, it appears to be tolerably certain that the St. James's Park of the early days of the Restoration was taken in hand by French gardeners, who laid out and planted its shady avenues, formed the Mall and Birdcage Walk, and constructed what was held to be not the least of its many attractions, a canal 2,800 ft. long and 100 ft. broad, planted on either bank with a fine avenue of trees. Indeed, this canal was esteemed the principal feature of what Pepys called "the brave alterations" made in the park, to which he paid more than one visit during the progress of the works. In 1827, when the rage for landscape gardening was at its height, and, as Mrs. Cecil reminds us, the sight of a straight canal had become intolerable, a contemporary writer was loud in his praise of Eyton, who planned and executed the alterations which "converted a Dutch canal into a fine flowing river with incurvated banks, terminated at one end by a planted island and at the other by a peninsula." The principal feature of Mr. Speaight's scheme for the improvement of the present desolate open space, the ugliness of which, as "The Yorkshire Daily Observer" remarks, "has been so obtrusive that the neglect of generations of authorities to take any steps to improve it must have been a source of wonder to many," consists of an enormous *place* or parade ground, approximately cruciform in plan, and bounded, on its western side, by a large semicircular terrace raised some five feet above the general level of the ground. This apse-like termination of the *place* is designed to afford convenient standing room for an immense number of sight-seers; whilst the parade ground itself, enlarged to the extent of at least one-third of its present area, would become one of the most spacious in Europe. Broad radiating avenues, placed at the inter-section of the semicircular and straight boundaries of the parade ground, lead, on the north, to the Duke of York's Column, and, on the south, to Storey's Gate. A canal 500 ft. long and 40 ft. wide, placed, approximately, on the site of the original one, extends from the main central line beyond the circular terrace of the parade ground to the new park entrance at Marlborough Gate. This canal would be bounded on both banks by broad walks, and separated from the park beyond by high-clipped hedges, containing semicircular alcoves designed for the reception of groups of statuary to commemorate British military heroes from King Alfred to Sir John Moore. Finally, the suggested new road, proposed to be placed on the south side of the central canal, brings the whole scheme into harmony with the existing Mall. Planned on sound architectural lines, and shown to the greatest possible advantage by some beautifully executed drawings from the facile pencil of Mr. C. E. Mallows, this admirable scheme for the adornment of the Metropolis is to be heartily commended to the serious attention of all lovers of London.

Selfridge's. The opening of Selfridge's last week has been, naturally enough, the occasion of much discussion of the architectural merits of the building. Architects do not seem quite able to make up their minds about the exterior; but the balance of opinion is favourable. There was doubtless much wisdom in the choice of style. The taste for French architecture being decidedly in the ascendant, it follows as a natural consequence that various writers have expressed admiration for what in the "Times" is described as "a considerable touch of the feeling gained by the men who have studied in the Ecole des Beaux-Arts in Paris; a style," he adds, "almost unknown in this country, though recently made somewhat familiar by the Ritz Hotel and 'Morning Post' buildings." The same writer thinks that the genesis of the building could be traced back to the old Custom-house at Rome, whose facade was formed by a row of eleven columns that originally formed part of a Temple of Neptune. Its genealogy, however, may be left to the investigations of the curious in such matters. So also may the designation of its style. That it can be rightly called "French Renaissance" has been denied. It has been pointed out that French Renaissance is markedly different, having for its most characteristic feature a high-pitched roof—in the earlier period sharply pointed and peaked, and later assuming the Mansard form. Other differences need not be insisted upon; they will probably please more persons than they offend, more especially those who deprecate servile imitation, "lest one good custom should corrupt the world." Franco-American Renaissance would perhaps be an approximately accurate description. The important point in æsthetics is—and upon this there is apparently a general agreement—that this large building is decidedly not repulsive. Its front is not without stateliness and dignity, with a touch of tasteful elegance both in the proportions and in the details, redeeming it from all suspicion of heaviness. Also it offers a solution (which is perhaps not final) of the great and vexatious plate-glass problem. A huge superstructure, depending apparently on the support of its abnormal expanse of plate-glass windows, is a sight that never fails to arouse the indignation of all lovers of architectural propriety, who hold that things should be what they seem. Thus genuine artistic susceptibilities will not be greatly shocked by the ground-floor windows at Selfridge's, where the proportion of voids to solids is not only actually but visibly just, offering to the timorous a most substantial assurance of stability. The front offers a more tentative and much less positive solution of yet another important problem—that of the architectural treatment of steel-framed buildings. It may be conceded that the Selfridge building presents a handsome frontage; but the decorative effect is obtained by means of the Portland stone, with which the steel supports are clad. The massive columns in this case, however, are weight-carriers, and not merely ornamental pilasters. The interior, which is planned as much on the American system as the eccentricities of the obsolescent London Building Acts, plus a few slight concessions by the L.C.C., would allow, will no doubt be closely studied by all who are interested in this class of building; and we are glad to have the opportunity of publishing in several issues a series of plans that, taken as a whole, afford a valuable indication of the best that is being done in modern arrangement and construction of this particular type.

America's Example. Mr. Swales, in his interesting paper read before the R.I.B.A. on the 15th, appeared to be a little overweighted by his title. And in truth any attempt to compress into the limits of an Institute lecture such an overwhelming subject as American architecture was foredoomed to compromise if not to failure. And Mr. Swales compromised by confining his survey to the city of Washington, taking its town-planning and its public buildings as generally representative of the United States. When one considers the various articles on the same subject that Mr. Swales is publishing in the "Architectural Review," and which have only, as yet, given an indication of the commercial architecture of the country, one can easily appreciate the difficulties with which he was beset. For though the history of American architecture is short, the vitality, originality and development of its manifestations are astounding. The contemplation of it all may—nay, should—fill us with discontent. We cannot be surprised if our feeble attempts at public and civic architecture should excite some amount of derision among our brethren over the water. At the same time we have our excuses; and the "Times," in an able leader on Mr. Swales' paper, draws attention to one of them. "The ugliness of many of our modern buildings," says the writer, "is the result not of any want of talent in the architects, but of parcimony in the employer, and when the employer demands a great show at a little expense, the result is a vulgarity for which he alone is responsible." It is a difficulty with even the educated layman (and, too often, alas! with many architects), that they cannot appreciate any spiritual side to the art. "Architecture," says Mr. Swales, "has been defined as the mirror of a people's needs, aspirations and enlightenment." And the "Times" adds:—"We are content for the most part if our buildings express our needs. We will not spend enough money on them to make them expressive of our aspirations. This may seem to be a poor way of putting the matter. But it is certain that no architect, whatever his genius, can produce a fine building if he is only allowed just so much labour and material as will enable him to solve his material problem, if he is forced to use the cheapest of everything." It is the unhappy fate of architecture that it can advance no faster than the intellectual and artistic intelligence of the people. Of all arts, it, most of all, depends upon public encouragement and favour. The great task before architects is to educate the public and themselves, but first of all they must obtain public respect for themselves, and their art. One could wish that Mr. Swales' paper, and others we have heard, could be read to lay audiences, in place of the dry descriptions of mediæval buildings which the University Extension lectures afford. Mr. Swales rapped home the truth again and again as some of America's fine new buildings were shown upon the screen. "Here is a building just about the size of the new London County Hall; it has cost about £4,000,000." The architects present could add the unspoken sting when they remembered the beggarly £800,000 allowed for the future seat of London Government. And Americans spend these vast sums upon their buildings because IT PAYS them to do it. We wonder when that profound truth will sink sufficiently into the public mind for English public architecture to get its chance. But the keen American business man wants the best architecture he can get for his money, and usually he does get it. He trusts his architect, and is slow to interfere with him. He employs a good man, and believes that is the best way to achieve his end. And his faith is justified by the results.

Copyright in Architecture. A deputation that waited on Mr. Asquith the other day with the object of urging the advisability of legislative action that would secure to architects protection against the copying of the buildings they design, did not receive very much encouragement. At the first glance, their position seems to be theoretically sound enough. Why should not an architect, equally with an author and a picture-maker, be safeguarded against the piracy of his work? Why should he, or any man, be robbed of the fruits of his ingenuity and industry? The question seems to be perfectly legitimate, and the attitude perfectly equitable; and the demand has been conceded in other countries. But nevertheless Mr. Asquith could hold out no prospect of redress. This result is not at all surprising to those who have disinterestedly weighed the pros and cons. The matter is not nearly so simple as on the surface it seems; nor is the hardship to architects as a body so great as some of them doubtless have special reasons for feeling it to be. Broadly speaking, it is no greater, perhaps, than that of any other author or artist who has the good fortune to set a fashion which contemporary workers greatly admire and strenuously endeavour to imitate. Of course, the cases are not exactly on all fours. A writer of fiction, for instance, may imitate a style and method that have proved successful, and may even follow pretty closely the plot and the characterisation that he admires, or that have won the approval of the critics or of the public. But the imitator does not copy his model, or any portion of it, word for word and line for line; whereas in the practice of architecture it may admittedly sometimes happen that an admired feature is copied almost "line for line." In the case of large and important buildings, this does not matter to the originator of the detail. He is not one penny the worse for the plagiarism, and may even feel flattered by it. It is in the case of the smaller buildings that the real grievance arises. If ingenious A excogitates a beautiful villa, and thickheaded B, about whom (as the American poet has it) "there is nothing original, except original sin," runs up fifty or a hundred exact copies of it, perhaps in shoddy and disgraceful material, A is entitled to consider himself robbed and outraged; and, alas! he has no remedy. The speculative building owner is too often guilty of this form of piracy, the architect's share of the profits on scores of houses being the price of one set of designs. This is a kind of traffic that one would like to see stopped promptly and finally; but unfortunately it seems to be beyond the wit of man to devise a remedy that would not be worse than the disease. The case against architectural copyright has been well stated by a decidedly sympathetic but far-seeing writer in the "Yorkshire Daily Observer," who says: "The argument that the matter is practicable rests on a case in which in Copenhagen a judge denied copyright to a building held to have no artistic merit or original character. A legal phrase like that in an English law might be made by an acute judge to mean much more than even the architectural fraternity have foreseen, and their last state might be worse than their first. Parliament, when it commenced to legislate on copyright, granted the privilege only to works having permanent literary value. The judges themselves, and not Parliament, stretched it to cover all literary productions, good, bad, and indifferent. A similar judgment on architectural copyright might stifle advance equally in the higher artistic work and in the not less necessary work of improving the homes of the poor." That, we think, is a very fair statement of the difficulties in the path. The request for protection is always met with the objection that it would be against the public interest. Nevertheless, if architects as a body really feel and can prove that they are labouring under a really scandalous injustice, they must make a united and a determined effort to get it removed; and they must not shrink from publicity as they seemed to do with respect to the deputation to Mr. Asquith, about which very few people seem to have heard anything.

ROYAL ACADEMY EXHIBITION, 1909.

The day for sending in architectural drawings to Burlington House is Friday, March 26th, from 7 a.m. to 10 p.m. As in past years we shall be happy to act as agents for delivering drawings to the Academy on the condition that we are allowed to reproduce any of the designs passing through our hands prior to their being sent in. We should appreciate the kindness of architects in forwarding their drawings as early as possible, and would mention that we can obtain more satisfactory results in the reproduction when we have plenty of time at our disposal.

Drawings for exhibition in the architectural room should be glazed and should have gold frames. Each frame must have a ticket pasted on the back, giving the number, title of the work, and the architect's name and address, to correspond with the particulars given on the printed forms, which must be obtained from the secretary at the Royal Academy, Burlington House, Piccadilly, W., and there should be attached to each frame, by string, a printed label (also supplied by the Academy) so arranged that it may hang over the front of the drawing. The printed form of advice should in all cases be forwarded to us to hand to the Secretary on delivery of the drawings. No exhibitor may send more than three works, and we should recommend intending exhibitors to avoid wide margins or mounts to the drawings, as space is a considerable factor in the arranging of the architectural exhibits.

THE GRAND MANNER IN ARCHITECTURE.

By Professor C. H. Reilly, M.A., A.R.I.B.A.

Architects who still read Sir Joshua Reynolds's discourses must often be struck by the fact that the generalisations and principles of art expounded by that versatile artist apply at the present time with much greater pungency and force to their own art than to the art he himself practised. From these generalisations, architecture, unlike poetry and music, is somewhat conspicuously and intentionally excluded, and it is clear from the one direct reference to it (in mentioning the work of Vanbrugh) that Reynolds largely misunderstood both its motives and its possibilities. From the few remarks he there makes, we may gather that he looked upon it as a sort of permanent scene-painting, a useful background for historical pictures, something to be seen and admired from one standpoint only.

Reynolds and the Great Style.

In spite of this, it is yet conceivable that the man who could draw so clear a distinction, as he does in his fourth discourse, between what he calls the great style and those he designates as the merely ornamental styles, who in short set so great a store upon abstract qualities, would have found in monumental buildings, had architecture been his life's work, just those qualities to which he pays such eloquent homage, but which are noticeably absent from his own canvases. In stone, in the 18th century, to be merely pretty would have been a more difficult task than it is to-day, with the widespread use of such materials as terra cotta, and, what I may call, whether it is executed in that material or not, terra-cotta detail. The temptation to Reynolds, therefore, to forsake the great style he advocated, might have been less in architecture than it proved to be in pictures primarily designed for the saloon or the boudoir.

The Grand Masters.

Before going on to consider how Sir Joshua defined this "great style," which he separated as something apart from and above all other styles, let me explain briefly why I venture, in applying his definition to architecture, to translate his term, "the great style," into "the grand manner," a translation for which I feel some apology is needed. It is, as may be guessed, because architects and archæologists in the past have so often mistaken the mere accidents of style for style itself, and have thereby degraded the term from that of an abstract quality to a name for a catalogue of the minutiæ, by which they would distinguish the building technique of one period from that of another. Style is in itself a quality in the appeal an object makes to the imagination, and by the somewhat grandiloquent term "the grand manner," I desire to draw attention to a distinction which, till the present day, has in various degrees been common to almost all the so-called architectural styles—a quality well defined, I think, by Reynolds in his fourth discourse.

The Great Aim in Art.

In this lecture, given, like the others, to a mixed audience of architects, sculptors, and painters, at the annual prize giving at the Royal Academy, Reynolds, before describing those qualities of mind and method which go to the production of painting in the great style, lays down the axiom, clear enough when stated, but apt in practice to be lost sight of among the multifarious buildings a modern architect is called upon to design, that the great end of every work of art is to make a direct appeal to the imagination; and he goes on to say that there must be no ostentation in the means by which this is done; the spectator is only to feel the result in his bosom. "An inferior artist is unwilling that any part of his industry should be lost upon the spectator. He takes as great pains to discover, as the greater artist does to conceal, the marks of his subordinate assiduity. In works of the lower kind everything appears studied and encumbered; it is all boastful art and open affectation." The ignorant often part from such pictures "with wonder in their mouths," and, Reynolds adds, though I doubt it, "indifference in their hearts." Frith's "Derby Day" would still draw a crowd if exhibited anywhere but in the National Gallery, and the vulgar stop and gape at, and may not always forget, the multi-coloured absurdities of certain recent buildings that it might be thought invidious to name.

Attributes of the Great Style.

Reynolds then goes on to point out the more abstract qualities attaching to "the great style," such as breadth of treatment, generalisation of detail, both in figure and landscape, the suppression of anything that may conflict with the main conception. "To give a general air of grandeur at first view, all trifling or artful play of little lights or attention to a variety of tints is to be avoided, and quietness and simplicity are to reign over the whole work." How admirably these words would apply to a building like Somerset House, and how well we know the way in which this repose is nowadays broken into by some piquant detail, fresh from Scotland or Vienna, inimical alike to any real quietness or simplicity.

But it is

In the Matter of Drapery

that Reynolds's description of the "grand manner," as the exposition of a single big idea, is most clearly seen. The exponent of such "does not debase his conceptions with minute attentions to discriminations of drapery. It is the inferior style which marks the variety of stuffs. With him [the painter in the great style], the clothing is neither woollen nor linen, nor silk nor satin, nor velvet; it is drapery; it is nothing more."

Insignificant Detail.

I think we see at once that this has a very direct analogue in architecture of the nobler sort. Just as we do not stop to inquire the material with which a Sibyl of Michel Angelo's is robed, neither do we make haste to recognise the honeysuckle in the necking of the Erechtheion capital, or the acanthus leaf as the root form of early English carving. But, more than this, in neither of these cases is it the carved ornament that first catches our eye. "The sublime," as Reynolds further says, "impresses the mind at once with one great idea; it is a single blow; the elegant indeed may be produced by repetition; by an accumulation of many minute circumstances." And, finally, after condemning the Venetians, who nevertheless were to a great extent his masters, as

MODEL OF THE MONUMENT TYPIFYING THE INDEPENDENCE OF THE ARGENTINE REPUBLIC, TO BE ERECTED AT BUENOS AYRES IN 1910. MM. CHEDANNE AND GASQ, OF PARIS, ARCHITECT AND SCULPTOR, RESPECTIVELY.

Note.—The scale of the finished work is shown by the figure in the foreground.

mere ornamentalists, he ends his discourse with this fine passage, which, if we understand his phrase "general nature" aright—that is, as a generalisation or abstraction from nature—a convention based on natural objects such as Claude used in his landscapes—we may apply with hearty goodwill and almost entire condemnation to a very large amount of modern building.

A Fundamental Principle.

"On the whole, it seems to me that there is but one presiding principle which gives stability to any art. The works, whether of poets, painters, moralists, or historians [or, we add, of architects], which are built upon general [that is, generalised] nature, live for ever; while those which depend for their existence on particular customs and habits, a partial view of nature, or the fluctuation of fashion, can only be coeval with that which has raised them from obscurity. Present time and future time may be considered as rivals, and he who solicits to one must expect to be discountenanced by the other."

Painting Parts Company with Architecture.

It may be admitted at once that the great style in painting as Reynolds conceived it, after a last flickering of life with Watts, has died, assisted to its death, perhaps, by the meagre opportunities and support given to it by modern architects. Painting, though, as painting, has had since then new fields opened to it; it has been born again into a new world with Manet, into a new atmosphere with Whistler. New vistas of life have been opened before it, new revelations of beauty have been disclosed by it, but it has parted company with architecture, and pictures have become like other precious objects—books and furniture—so much bric-à-brac, to be moved with impunity from room to room, or from building to building.

Reynolds's Principles Applied.

Returning however to architecture, we may, I think, safely lay down Reynolds's principle of unity as the first essential of the grand manner. A building must present to the imagination a complete and finished idea, however numerous its parts, however complex its purposes. A test of perfection is the impossibility of altering even to minor masses or detail. To take a very simple illustration of what is meant by unity, a good building viewed as a whole cannot be separated into two ideas, one of plan and the other of elevation; they must each be the natural outcome of the other. A plan is an architectural conception as much as a facade; no beauty of detail can compensate for badly shaped or badly arranged spaces, for these lead to badly shaped and badly arranged masses. We hear too much nowadays of the architect who can plan and the architect who can design. No architect can design who cannot plan architecturally, and no architect can really plan—that is, plan to make architecture—who cannot design too.

Unity of Conception.

I am not now speaking of the minor conveniences of planning, those matters of detail and common sense into which some men can put so much more energy and interest than others, and by which, unfortunately for architecture, competitions are so often decided. I am speaking rather of a plan as the root form of a building, the shape or series of shapes from which all the main masses are derived and obtain their meaning. The plan in this sense is far more essential to the completed conception than either exterior or interior elevation. By unity of conception, then, is meant that, however many parts a building may have, they must all be organised members or limbs of one body. There is no doubt that in laying down this principle for painting, Reynolds has stated the first essential of all great building likewise. The second essential to this supreme distinction corresponds to Reynolds's limitation of the great style to paintings of historical or mythological subjects, a distinction that in painting, however, no one would maintain to-day. We can, nevertheless, see the real point Reynolds had in his mind, and this can be applied to architecture, if it no longer holds good in painting. It is that those pictures belong to the great style in which the majesty of the human figure is insisted upon; or, if we may transfer a term from architecture, those in which there is a large and an ample scale.

(*See Centre Plate.*)

Importance of Scale.

In architecture, therefore, the corresponding limitation is not in the subject, that is, the kind of building as might at first sight be supposed, or in the absolute size, but rather in the scale. We would all admit at once that we could not call a building small in scale and full of minute detail in the grand manner. The building to be so distinguished must rather be built in that large and spacious way we designate by the term "in a large scale." For the repose and dignity, the remoteness from fussy human occupations, which are essential to monumental building, this is indeed a first requisite. It is far more important than absolute size, though it insists on a minimum of that.

The question how "scale" in buildings can best be obtained is, I think, rather a complex one. It seems to be possible to achieve bigness of scale by so many different and opposite methods. It can be obtained by few and large parts, as in the Parthenon, or it can be lost at first sight by them, as in St. Peter's. It may be enhanced, on the one hand, by the foil of small parts seen against larger ones, as in the colonnades between the main piers in the new cathedral at Westminster, or it may be defeated as in the river front of the Savoy Hotel, by a mere multiplicity of detail.

If one may generalise at all on so subtle a part of our art, it is that the effect we aim at under the term "largeness of scale" is best described by saying that we try to give to our buildings an appearance that they are inhabited by not quite ordinary mortals, but by a more leisured race of slightly bigger bodies and more refined perceptions than we ourselves possess. For this illusion there must be simplicity and spaciousness in our vestibules and staircases; a dignified approach from one part of the building to another, as well as a corresponding simplification and enlargement of the main details.

Height of Columns.

Columns, for instance, by a long usage have received a certain limiting size bearing a certain ratio to the human body. The order at Greenwich is 36ft. high, and gives a sense of grandeur to the whole group of palaces. The order at St. Peter's is nearly 100ft. high, and it takes many visits before its size can be appreciated. Perhaps Michel Angelo peopled his building with the Colossi from the Medici tombs or the Titans from the Sistine roof. Such conceptions of architecture are beyond the ordinary mortal; they burst too suddenly on the world to be assimilated. If they had been, and Michel Angelo's scale had been copied rather than his eccentricities by succeeding architects, we might to-day have been able to think in orders of 100ft. or more, and the world would have been a finer place to live in. For it is quite clear that custom has a great deal to do with the matter. A very large order, or its equivalent, looks better in Paris, and better still in New York or Chicago, than it does in London, where the general scale of the town, in spite of its size, is less. The effect, then, of largeness of scale is to be obtained at any given time by such increase over the general scale as can be appreciated, and is in proportion to the environment. Cockerell's Bank of England in Castle Street, Liverpool, succeeds in being impressive in its scale, where a much bigger building opposite in a still larger scale degenerates in comparison into clumsiness.

The sense that a great building gives, that it belongs to a finer race of men, is sometimes given to much smaller buildings by the use of simple masses of one material, such as large blocks of stone. In nearly all primitive buildings, from Stonehenge to the Parthenon this method of impressing the beholder has been adopted. The feeling that giant labour must have been used for the work is perhaps at the bottom of it, though that is not a quite sufficient explanation. We see something of the same effect in the most homely cottage when it is built of big stones. North Wales, which is poor enough architecturally, has yet here and there these simple massive cottages, which in their immutability never fail to impress one with the sense that they are akin to the mountains and the larger works of nature which surround them. The impressiveness of Piranesi's prison dreams, apart from their power as pictorial compositions, is largely due to the massiveness of the masonry he has introduced. We feel how hopelessly lost are the pigmy human beings among such titanic structures.

Greek Love of Monolithic Effect.

The Greeks were particularly anxious to give this monolithic character to their temples; when building in marble they rubbed the beds to make the joints as thin as to be invisible, and when building in stone they covered the whole with a fine marble stucco to obtain the same appearance. The majesty and remoteness of the Parthenon, which is not a big building as modern buildings go, the sense that it is a building for the use of gods rather than men is entirely due to the largeness of its scale. The three steps on which it stands, out of all proportion to the human figure, help the illusion, while the smaller detail of the cornice and frieze acts as a foil to the simple mass of the roof and the gigantic sturdiness of the columns. It is a commonplace that no building in the world combines such delicacy and refinement with such a sense of restrained power.

Restraint and Refinement.

This brings us to the third constituent of the grand manner—restraint, with its attendant and complementary quality of refinement. By this I do not mean any emasculated elegance, but rather that repose of manner and delicacy of outline which is a sure sign of strength—the strength of the steam-hammer which can forge an armour plate or crack an egg. This is the refinement which would avoid any crude naturalism or over-emphasis in ornament; which would give it a conventional and abstract rather than a natural form, corresponding very closely to Sir Joshua's definition of drapery. Such refinement should prevent any sudden contrasts or efforts after piquancy so frequent in modern building. It should not, for instance, be satisfied with a large mass of rich ornament planted on a plain, unmodulated field. Instead of over-simplification and concentration of effects, we should find a suave, grave manner, infusing itself over the whole design. Columns should be fluted, suitable mouldings carved with their proper enrichments, and all those small indications of good taste, which we know so well how to look for in dress, should be apparent in our façades to those who can see them. These, then I take it, are the three chief attributes of the grand manner as we have learnt them from Reynolds—unity, scale, refinement. Let us now look into the matter historically and see where some or all of these qualities are to be found.

Egyptian Unity of Conception.

Without considering any architecture which is not in the direct line of our descent, and must therefore speak to us in an alien tongue, we may begin with Egypt, where we find our first characteristic—unity of conception—carried out with singular completeness in certain definite directions.

In the architecture of the ancient temples of the Middle Empire, the great period of Egyptian building, we find everything arranged to impress the beholder, as he advances along the central axis, with the sense of the impenetrable mystery and power of religion. The long approach through avenues of sphinxes, through one massive gateway after another, across court after court, each more confined than the last, until that forest of huge columns, the hypostyle hall, is reached, through which is dimly seen, still on the line of the central avenue, the shrine and sanctuary, lit only through the entrance door, and again beyond that the rooms of the mysterious attendants of the god. All these things add increasing intensity to the conception of mystery combined with secret power, which is the *motif* of these temples.

The sense of scale is there, too, to an extent which is almost overpowering, and if refinement of form is not at its highest pitch, at any rate the whole scheme of decoration obeys a very distinct law of its own. The building then is of the grand manner if approached along the right axis and with the right point of view. In any other direction it presents blank walls and, apparently, unrelated rooms.

Hellenistic Temples.

Passing on to Greek Hellenistic architecture, as seen in the temples—the only buildings we know much about—we find exactly the reverse is the case. The buildings are as complete, from every external point of view, as a porcelain vase or an isolated bronze figure. The unity of idea is almost bald in its simplicity—a hall surrounded by columns under a single roof, the whole executed with every care and solicitude to give the appearance of being sculptured out of a single mass of marble. I have dwelt already on the largeness of scale in which this is done, while the many and subtle refinements introduced to overcome optical illusions, which might detract from the completed, perfected whole, are commonplaces of the textbooks. The result, therefore, within its limited range, may be said to be as perfect and unified a conception as the human mind is ever likely to achieve. And yet we must admit, if we are sincere, that the Greek, in seeking perfection as he did, limited the scope of his art. His temple, seen from the outside, presupposes a single hall in the interior. As a matter of fact, it generally con-

sisted of two or more apartments, no suggestion of which is given by the exterior. The point of view of the designer seems to have been that of a sculptor modelling a single figure for an isolated pedestalled position. Accepting this, everything was done to impress the beholders, to give that single blow upon the mind which a work in the great style should always produce. The most delicate refinements, the severest repression of any detail which might compete with the unity of the whole, were always employed. So far as it went then, and for the exterior only, Greek temple architecture was of the very essence of the grand manner; but what we must admit, if we are not carried away with the narrow enthusiasm of the archæologists, is that the problem attempted was extremely simple. To achieve anything like the same results, to give the same sense of unity, scale and refinement to a complex modern building, is an infinitely more difficult problem, and one that gives far greater scope to the genius of the individual. For, as with the churches of the Middle Ages, so with the Greek temples, with a few exceptions, there always existed a traditional shape for the general mass, as well as a traditional way of articulating the detail. Each temple, as each church, was a refinement or otherwise on its predecessor. No choice of method, no planning, no composition of major or minor masses in any modern sense was open to the designer, whereas the architect to-day must bring his art to bear upon, and translate into monuments worthy of his country, a vast variety of human institutions.

The All-conquering Romans.

Leaving, then, the Greeks, who no doubt consciously renounced variety in their building, just as they refused to individualise their sculpture, in order to obtain perfection within certain definite types, we pass to the Romans of the Empire, to whom all things were possible if all things did not turn out to be expedient. To the conquerors of the world, architecture knew no self-imposed limits; and if we cannot always admire their taste and choice in the materials and detail in their buildings, we, who live in an engineering age, must pay homage to those who attacked all problems with equal daring, if not with equal success. There was nothing dilettante in the spirit of the Roman, who reared, higher than many a mediæval cathedral, the solid vaults of the Baths or sprang the Pont du Gard from hill to hill. A sense of unity which would remove one of the seven hills of Rome itself in order to lay out the vast hemicycles of the forum of Trajan without loss of symmetry, which converted a square mile of Rome into colonnades and porticoes of surpassing magnificence, which evolved the orderly procession of stately shapes in the plan of the Baths of Caracalla, or conceived the mighty sweep of the Colosseum Wall, this was a sense of unity—the first element of the grand manner—exhibited in a way the world had not yet seen. If we examine in detail the plan of the central block of one of the vast clubs or universities which we know by the name of baths, such as that of Titus or Caracalla, we find every element of the plan arranged to give on either axis the utmost grandeur of internal vista and effect. Here is a complex modern plan, such as the Greeks never attempted, of which each part is well shaped, well combined, and well contrasted with every other; and focussing the whole is a hall of surpassing proportions and magnificence. In

The Baths of Caracalla,

the main vista is 250 yards long, and the central block itself is greater than the Houses of Parliament, the Law Courts, or the British Museum. But the main point for us is that here is an organised series of halls of varying heights and sizes combined into one homogeneous structure—the problem of modern building. The second element of the grand manner, a large scale, is equally apparent. It was chiefly obtained by means of colonnades of smaller columns contrasting with the main piers, and enhancing the vista in every direction. That these buildings, as far as we know, lacked the third element, refinement and restraint in detail, may at once be admitted. What, however, is more important from our particular point of view is, as far as we can gather from the plans and the remains that are left to us, that the exteriors of these complex buildings were in no sense worthy of the interiors. The outside of the Pantheon, whether clothed in marble or not, makes this abundantly clear. The buildings seem either to have been screened by some kind of colonnade, or left as blank walls. The sense of architectural composition which the interiors show does not seem to have been applied equally to the exterior, so that that complete sense of unity of which we are in search, which failed us with the interiors of the typical Greek building, now fails us with the exteriors of these typical Roman buildings. Except the Colosseum, which is really a single chamber, I do not know that we could say of any Roman building that it had a completely harmonious and satisfactory internal and external composition.

This, then, was the problem which was left unsolved at the collapse of the Augustan period. In the East, in Byzantium, where the Greek mind reacted on the Roman methods, a solution was arrived at, and more or less complete harmony between exterior and interior work was brought about. I do not feel, however, in spite of modern revivals and archæological interest, that that solution directly concerns us. It is, as I have already said of other architecture, outside our direct line of descent.

The Kernel of the Renaissance.

The solution which does concern us, with which the majority of us are engaged each day, is the one the Renaissance architect gradually achieved. The conscious attempt to solve the problem of complete unity was no doubt due to the intervening period of Gothic architecture in the North of Europe. It was there for the first time that a building equally expressive and harmonious from within and from without was evolved. It does not matter for the purpose in hand that this was done unconsciously by letting the construction speak for itself and determine the forms used, for Gothic architecture had thereby set a standard of truth which it was impossible for the Renaissance architects, even in Italy, to ignore. The result was that while striving to produce buildings which in their ignorance they considered to be in "the antique manner," they were really doing work as different from Roman work as that was from Greek.

The Great New Fact

which emerged with the Renaissance was the recognition of the personality of the artist. In every art the same thing occurred: the personal attitude to art was part of the intellectual upheaval of the times. The weakening of tradition brought about by the rival forms in vogue gave opportunity to individual expression. The result was that Renaissance architecture, and all the Renaissance arts, became in a sense self-conscious, and the forms of expression used were the objects of deliberate choice. We may, therefore, say that the Renaissance solution to the problem of unity consisted in applying the personality of the artist to the work in hand: the architect for the first time moulds his building and composes his masses, the sculptor chooses his subject and arranges his groups, the painter designs his composition—each on the free lines of his individual choice.

A Bold Departure from Tradition.

The Pazzi Chapel, it has been well said, presents as bold a departure from tradition as Columbus's voyage into the unknown. Such vigour in the nature of things could not last indefinitely, but for a couple of centuries architecture in Italy was saved by the powerful personalities of its practitioners from anything like the mere reproduction of the works of antiquity, or of any deliberate intention thereto. It was not till the affectation which followed the discovery of the writings of Vitruvius that anything so disastrous to art came about. It was then time for other countries, for France and England, to take up the running.

Strength and Delicacy.

But before this had happened, Peruzzi had built his Albergati and Massimi Palaces, combining delicacy almost Greek in its refinement with strength and austerity unknown to the Romans, while San Michele, at Verona, in his gateways through the city walls and in his Palazzo Gran Guardia, Vecchia, as well as in the lower storey of the Grimani, had shown how to use the orders as their master rather than their slave. None of the great Italians compare with him in the breadth and bigness of his work, in suppression of all subordinate features, to obtain one great effect; that is to say, none compare to him in the grand manner. The only possible exception is Michel Angelo himself, and that only because of the enormous scale he habitually used. If we may take the Palazzo Conservatori as his own in any sense, this is the one element in this group of buildings I would claim for him—the element which, in spite of its debased detail, gives it its undeniable effect of grandeur.

The Classic Eighteenth Century.

Leaving early and tentative work in France and England, and coming to our own fully-developed Classic architecture of the 18th century, it is easy to find examples, which if they lack in conception the highest flights of imagination and daring, exhibit not only unity of idea, but the elegance and repose we instinctively associate with the men and manners of the 18th Century. The Customs House, Dublin, by Gandon, is a good example. It is not only big in scale, but powerful in composition. It has the same sort of simplification of detail that San Michele used, witness the reduction of the main frieze and architrave into one powerful member. Somerset House, particularly in the river front, has something of the same feeling; the masonry of the basement storey being almost Piranesi-like in its strength.

Quiet Grandeur.

That it was possible to give the same air of quiet grandeur to a small building is shown by Hawksmoor's Clarendon Press, at Oxford. This building is quite a small two-storey structure, but with great skill the architect has given it a portico with columns 3 ft. 10 in. in diameter and 40 ft. high, without either dwarfing the building or making it appear a mere adjunct to the entrance. He has instead, by a careful suppression of competing detail, welded the whole into one sculpturesque mass, in which the great scale of the columns is admirably maintained.

While largeness of scale may be said to have been the chief characteristic of our late 18th Century architecture, it was accompanied, when in the hands even of provincial practitioners, with a refinement of detail which we have long since lost. Let me instance the older rooms at the top of the main staircase in the Town Hall at Liverpool. I know no more elegant apartments either in shape or in refinement and delicacy of enrichment. Yet these were the work of two architects, father and son, who practised in Bath—the Woods—showing that at that time, when there was behind the architect a convinced body of opinion, it was possible to obtain scholarly work far beyond the metropolis. Indeed, Manchester and Liverpool are full of such work. It does not matter how small or poor the house may be, there is always

A Sense of Scale

in the simple plainness of the exterior, and a sense of refinement in the finish of fan-light, doorway, fireplace or reeded cornice. The same spirit spread to the furniture-makers, the china-makers, the plate-makers. Do we not all collect late 18th Century bric-à-brac when we can, and are we not happy with our Heppelwhite and Sheraton chairs, whether they have any claim to those august names or not? We see the same spirit in the arrangement of the rooms. Nothing is haphazard, unbalanced, or meaningless. Consider that example of Robert Adam's planning, a house in Grosvenor Square, for Lord Derby. It is for the ordinary awkward slip of a site in a town, and yet what an elegant suite of rooms we can see these forms will make. Notice the splendid vista on the first floor, and the general sense of ease and unity which pervades the plan.

Reactionary Revivals.

But this consensus of opinion, which made it possible for every detail of a building and its furniture to be harmonious, refined and elegant, has long given way before the series of revivals from which we are still suffering. But while we in England have been following the will or the wish of one architectural fashion after another, with no real faith or knowledge to guide us, France and, more lately, America has been content to develop the old large-scaled 18th and early 19th Century architecture from where we left it, and to add to it new detail and new interest, until

The Ritz Hotel,

in Piccadilly, suddenly appears as a veritable portent among us to show how far we have been left behind. The Ritz is typical French work; shall we say that the Midland Hotel, Manchester, is typical English! Is it not time we began more seriously to study the work of our great neighbours? Painters and sculptors have long ago found this out to their advantage. In every Prix de Rome drawing there is an amplitude of planning, a spaciousness of effects entirely absent from English work.

The Americans, too, in their banks and public offices and some of their larger residences have attained a consistency and dignity of idea, as well as a breadth of treatment which vies with the best modern French work, and often surpasses it in what we might in the eighteenth century have called an English characteristic—soberness. The success of both these countries (France and America), I am convinced, lies in the sound initial training that the best architects get in what we call classic or academic work. They learn in their schools to draw carefully and to shade carefully their orders, and then to apply them in simple composition. I am quite sure that the painstaking, shaded drawings alone have a great deal to do with refinement and delicacy of detail. How could Cockerell have rendered the beauty of his mouldings with a line on the drawing as thick as the fillets are in real life?

I am convinced that the day of the coarse swag and the heavily-blocked column is over. Students with the keen eye that the best always have for what is in the air, are already beginning to turn their attention to the greater delicacies of the early Greek work in England, and to measure the buildings of such men as Smirke, Soane, Elmes and Cockerell. This brings us one step nearer, I hope, to a

Great Cosmopolitan Art of Architecture

in which we shall compete as equals, not with each other only, but with the world at large. When that time comes I think we shall find that that combination of unity, scale and refinement I have ventured to term the grand manner will be the first essential to success.

Mr. George Frederick Bowman has been appointed architect for the Leeds workhouse extensions.

* * *

Our contemporary "The Cambrian" takes as an example to manufacturing firms and builders, the arrangements of Messrs. Johnson Brothers, dyers and dry cleaners, of Bootle. The firm has recently acquired four acres of land for possible extensions to their works, and have, for the present, laid it out as a recreation ground for their employees. Shrubs and trees have been planted, a bowling green laid down, also tennis courts, croquet lawns, and pitches for quoits. Cricket, football, and hockey grounds are also being prepared. Two pavilions have also been built for use as club rooms, for the use of the male and female employees, fitted up for winter games, as billiards, etc., with provision for cooking meals and supplying light refreshments. This is certainly a public-spirited policy, upon which we make our compliments to the firm in question.

* * *

In the notes on "Our Plate" of March 10th the name of Francis Reade of Co., electrical engineers, 2, The Broadway, Church End, Finchley, was given as Francis Vere and Co. The name was given as received by us, and the mistake is probably easily explained by the fact that Mr. C. M. Vere is manager of the firm.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
Mar. 31	MIDDLESBROUGH. New Library in Dunning Road and Grange Road, East Middlesbrough. Premiums, £50, £30 and £20. Particulars and conditions on application to Alfred Sockett, Town Clerk, Municipal Buildings, Middlesbrough. Deposit £2 2s., which will be refunded if the conditions are returned within ten days
April 10.	BOLTON BRANCH PUBLIC LIBRARIES. The Libraries Committee of the Corporation invite competitive plans from architects who have been principals in the County Borough of Bolton six months prior to the present date for Branch Public Libraries to be erected in the districts of Astley Bridge, Halliwell, and Gt. Lever. The plans and particulars may be obtained from Samuel Parker, Town Clerk, Town Hall, Bolton. Deposit, two guineas.
April 12.	ELLAND NEW SECONDARY SCHOOL. Architects having offices and practising in the West Riding of Yorkshire are invited to compete for the work in connection with the new Secondary School at Elland, and should apply for particulars to Mr. Leonard Clegg, Holiwell Green, near Halifax.
July 31.	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	BOURNEMOUTH BRANCH PUBLIC LIBRARY. Architects practising in the County Borough of Bournemouth are invited to submit designs for a new Branch Library at Boscombe. Particulars from Charles Riddle, Borough Librarian, Central Library, Bournemouth.
No date.	WALLASEY U. D. COUNCIL CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

Pretoria (S.A.) Post Office.

The assessors, Messrs. A. Baker, W. F. Stucke, and W. Reid, all of Johannesburg, have made their award in the above competition. Mr. A. J. Stewart, of Messrs. Howard and Stewart, Johannesburg, is awarded the first place; the second goes to Messrs. Kraan and Wyers, of Pretoria, and the third to Mr. J. E. McKenzie, of Boksburg.

Our Plate.

The drawings on our centre plate and on the early pages of this issue represent four designs for a Campo Santo, to contain monuments to Vitruvius, Sanmichele, and Peruzzi. They are the work of students at the School of Architecture, Liverpool University (under Professor C. H. Reilly), whose ages average from 18 to 20 years; they have had two years' study in the day school, coming straight from public schools, and having had no previous special instruction in drawing, except Mr. Lemon, who had had some previous training in an office. The subject was set as an ordinary design subject of the academic type, which, at the Liverpool School, is alternated with designs of a more constructional character. Since completing these drawings, the same students have designed an inn for a country town, and are now at work on an art gallery. The constructional designs are worked out in detail, the academic type being left in the stage here shown. All designs are worked out in the school, and the subjects increase in complexity and difficulty during the progress of the course.

TESTS OF ROLLING SHUTTER DOORS.

Messrs. Arthur L. Gibson and Co. draw our attention to an inaccuracy in the report on page 243 of our last issue under the above heading, in stating that this double door test (No. 135) *may be deemed a record*, in respect that the doors not only withstood the four hours' test, followed by the application of water, but that one of the doors could be worked after the test. Messrs. Gibson refer us to test No. 111, where, it is pointed out, the test was much more severe, seeing that the gas producing plant broke down after three hours and ten minutes. Water was immediately applied at a pressure of 60lbs. The test was renewed three days later, and water again applied at its conclusion. In spite of this double test, both shutters were workable at the conclusion of the test, as is evidenced by the report and the photographs accompanying it. The fire at no time passed round the shutters. So little did the shutters in test No. 111 suffer that they were on exhibition during the whole of the Builders' Exhibition at Olympia in 1907, and thereafter one of them was sold, erected on a building, and has been in regular use ever since.

Proposed New Buildings.

ACCRINGTON.—The Town Council has decided to build new baths, including swimming and slipper baths, at a cost of £10,450. The L.G. Board has sanctioned the scheme.

BIRMINGHAM.—The L.G. Board has held an inquiry into the application of the City Council to borrow £11,170 for the provision of a new fire station at the corner of Albion Street and Legge Lane.

BRAMHALL.—A new church is to be erected here at a total cost of £7,500. The scheme will be divided into two parts, the first to cost about £4,000.

CARDIFF.—The watch committee are considering the provision of a new fire station. Plans are to be prepared for alternative sites at (1) on the present site and land adjoining in Westgate Street, (2) in Womanby Street, and (3) in the Fish Market.

CORK.—The Corporation are proposing to raise the sum of £16,000, to erect a new technical institute in Fitton Street.

DUMFRIES.—The Town Council are considering the erection of a new town hall and municipal offices. The probable cost is stated at £17,500.

GLASGOW.—The City Engineer has been instructed to prepare working drawings and specification, quantities, etc., for an extension of the public slaughterhouses. The cost is estimated at £65,000.

HUDDERSFIELD.—The Town Council are applying to the L.G.B. for a loan of £12,000 to erect a new elementary school for 600 children at Birkby.

KENDAL.—The Westmorland County Council is proposing to erect new technical schools here at a cost of £10,000.

KIRKBURTON.—A new Council school is to be erected here to accommodate 250 children.

MIDDLETON ST. GEORGE.—The Darlington Sub-education Committee of the Durham County Council are proposing to build a new school here to accommodate 200 children.

PAISLEY.—An extension of the Renfrew County Buildings is contemplated to provide extra accommodation for the Police and Public Health Departments. A sub-committee appointed to consider the question has delivered a report to the Council.

WEST HARTLEPOOL.—A new theatre is to be erected at the corner of Lynn and Freeman Streets. The plans presented by Mr. R. Thornton have been passed by the Town Council.

FEDERATED EMPLOYERS.

The Federated Employers' Insurance Association, Ltd., notify that on and after March 29th instant, the address of the Association will be 8, King Street, Manchester, more extensive premises having become necessary.

INSTITUTE MEMBERS' CLUB.

A meeting of the above will be held in the smoking-room of the R.I.B.A., 9, Conduit Street, to-morrow, Thursday, March 25, 1909, at 6 p.m.

Coming Events.

Wednesday, March 24.

Northern Architectural Association (Newcastle).—Annual Meeting, Exhibition of Students' Work, and Presentation of Prizes, 7.30 p.m.

Edinburgh Architectural Association (117, George Street).—The meeting arranged for this date has been postponed.

Glasgow Institute of Architects (187, Pitt Street).—Symposium on Competitions.

Saturday, March 27.

Northern Polytechnic Architectural and Building Students' Association.—Visit to Messrs. Kirkaldy and Sons' Testing Works, 99, Southwark Street, S.E., 2.30 p.m.

Monday, March 29.

Royal Institute of British Architects.—Sir Aston Webb, R.A., F.R.I.B.A., on "Buildings for Higher Technical Education," 8 p.m.

University of London (South Kensington).—Mr. Banister Fletcher, F.R.I.B.A., on "Georgian Architecture," 8 p.m.

Tuesday, March 30.

Bristol Master Builders' Association.—Annual Dinner, Royal Hotel, Bristol.

Builders' Clerks' Benevolent Institution.—Annual Dinner, Holborn Restaurant.

Wednesday, March 31.

Edinburgh Architectural Association (117, George Street).—Mr. James Ballantine on "Stained Glass," 8 p.m.

Thursday, April 1.

Leicester and Leicestershire Society of Architects.—Mr. W. K. Bedingfield on "The Architectural Possibilities of Reinforced Concrete."

Monday, April 5.

Society of Engineers (17, Victoria Street, Westminster).—Ordinary Meeting, 7.30 p.m.

Liverpool Architectural Society (13, Harrington Street).—Annual General Meeting.

Wednesday, April 7.

Northern Polytechnic Architectural and Building Students' Association.—Lecture on "The Hennebique System of Reinforced Concrete," 8 p.m.

Edinburgh Architectural Association (117, George Street).—Associates' Business Meeting, 8 p.m.

At the annual general meeting of the Society of British Sculptors, Mr. Thomas Brock, R.A., in accordance with his intention announced some time since, retired from the presidential chair, and Sir Charles Lawes-Wittewronge was elected president. Mr. Brock was elected treasurer and Mr. E. G. Gillick, Mr. Basil Gotto, Mr. Havard Thomas, and Mr. A. G. Walker were elected to serve on the council.

GEORGE DEVEY AND HIS WORK.*

A Grateful Client.

George Devey was born in Dorset Place, Kentish Town, London, in the year 1820. His father was a solicitor practising in Ely Place, Holborn, where for some years he lived with his family. It was through some extraordinary services, rendered to a needy client, that in the end secured for our friend an introduction to a distinguished man, resulting in the foundation of the young architect's practice. A gentleman, the reverse of rich, had been recommended to consult Mr. Frederick Devey, the solicitor (and father of our friend), with reference to the recovery of some property which had almost been given up as lost—partly on account of the lapse of time and the difficult tangle into which things had got, and partly because the client was poor. However, after endless investigation, with little chance of payment, the faithful solicitor succeeded in recovering a large estate, which put the needy client into very comfortable circumstances. The client's gratitude was great, and he took every opportunity of recommending and introducing George Devey, wherever there was any chance for the young architect. As a result, Lord Hardinge became one of his first clients. This was the commencement of his professional work, and it was with natural pride that Mr. Devey would narrate the interesting and romantic story redounding so much to the honour and credit of his father.

In course of time the

Conscientiousness and Painstaking Work

of the young architect over little things, together with his natural ability, refinement, and attention to all the wishes of his client, so impressed the noble lord, that he soon gave him more important commissions, and went out of his way to find work for him. And he took a pride in showing his friends the drawings and sketches, which he had asked the young architect to send him for that purpose. This circumstance, as well as the natural conviction, which Mr. Devey always held, led him to impress upon young men the importance of doing justice to and taking pains over, the smallest commissions.

Painter or Architect?

From Kentish Town, when the children grew up, the family removed to Ely Place, Holborn, in order that the boys might go to King's College School. He was well grounded in Latin and French, and the latter he could speak with fluency. After he left school we hear of serious discussions as to whether he should follow the artist's or the architect's profession. He preferred the former, and from childhood had shown distinct ability in that direction. There is an impression that for a time he worked under J. S. Cotman and J. D. Harding, for whom he had a great regard, being influenced chiefly by Cotman. The earliest sketches about this period show great care in details, though they are somewhat formal according to the manner of that time. But his father and all his friends were against George's being an artist, for in the early part of the last century the calling was hardly thought of as respectable enough to be classed with the professions. Eventually it was decided to article him to a Mr. Little, an architect and surveyor—at that time there were few men practising only as architects. Mr. Little appears to have had a small practice of a classic character, and the young man must have had rather a dull time. We hear of surveyors' dilapidations, and of the monotonous calculations involved in quantities.

A Gothic Church.

The most important thing he did in conjunction with his master were the designs for a new church—St. Mark's, Primrose Hill. Of these there were a number of drawings showing marked ability, especially when we think to what a low level architecture had sunk at that time, and it is the more remarkable when we remember that this work of his was almost before the Gothic revival had made any headway. In such an office and in such an age, how he acquired the true character, feeling, and details of Gothic work is difficult to say, except by the unerring intuition of the artist; and the revival then just starting, in which he must have been one of the first to participate.

After leaving Mr. Little he went on a Continental tour with his friend and fellow pupil, Mr. Coutts Stone, going through France and Italy to Athens. In those days, when railways were few, it was a considerable undertaking, but it naturally allowed more time and convenience for observation and sketching. This our friends enjoyed to the full. There are not many drawings left of this tour, but what remain are exceptionally good, especially those made in Venice and Athens. They show, as do all his sketches, in choice of subject, in composition and in refinement of execution, all the best characteristics of the true artist.

It was

In the Penshurst Country,

where his first business engagements commenced, about 1850, and he continued going to and fro to the year of his death, as friend and architect. Lord De L'Isle was one of his first clients, and remained all through to his decease. The restoration and repairs at Penshurst Castle were begun about 1850; the place had been very much neglected, and the work was many years in hand, together with lodges and new cottages about the estate. The greater part of the work was done by an interesting and independent old character, an excellent type of the yeoman-farmer and builder combined, who used to talk to his lordship and Mr. Devey just as he talked to his men. He was well versed in the old methods, and did good work. Here, too, were a house and various buildings done for James Nasmyth, of steam-hammer fame, who was a personal friend and always proud to show his visitors the boots he had kept when, as a workman, he tramped the country. Not far off is Hall Place, a large mansion and stables, built for Mr. Samuel Morley. Perhaps the most numerous examples of Mr. Devey's work are in this county and the Aylesbury district, where a great variety of work was done on the Rothschilds' estates.

He had

A Keen Sense of Humour,

and the sparkling sallies of wit, cheery banter and quiet sarcasm often turned business into pleasure. He had a commanding and distinguished presence, with a generous and kindly manner, shown to workman and client alike, as befitted the gentleman he was. In going over buildings, when things had gone wrong through carelessness, he would try gentle, and sometimes severe, sarcasm, as the case required, but when deception was met with, although he never lost his temper, his indignation made itself felt, with all the more force. To a foreman making the lame excuse for indifferent work, that it could never be seen, he said, "What, not seen? I should be ashamed for the birds to see it." He never would hurry over inspections and instructions to foremen, and there were times when clerks of works and foremen wished that he had not been so devoted to his work. He always liked to call himself a working man, and often regretted that there was no badge for us to wear in common with all workmen, showing the sympathy he had with all honest work. He hated the dress coat and Sabbatarian black, and liked home-spuns and quiet coloured shirts, not white linen.. He was

Full of Resource,

ingenuity and invention. An old foreman, who for years followed him about on works, used to say with pride that you could never get him into a corner, he always fought his way out, and many were the difficult problems that he would save for solution.

It is interesting to note, now that

Garden Craft

has become such an important adjunct to the complete design for a country house, that Mr. Devey was certainly one of the first in our time to take any practical part in its development. The immediate approaches and surroundings, the entrance courtyard, the enclosing walls and archways, the terraces, the disposition of steps, and the arrangement of gardens, connected with every well-appointed house, he always held came properly within the province and should be the work of every competent architect. And he attached great importance to the comprehensive treatment of all this, as a vital and necessary part of the whole design. An excellent example may be found in Coombe Warren, where the best characteristics are all brought in.

Hated the Contract System.

The commissions chiefly consisted in country houses, although there were a number of new schools and churches, repaired or restored. At the busiest time there were about ten men in the office, one modeller in constant work, and six clerks of works. For some years George Myers, the builder, carried out the largest works, and in this there was the great advantage of dealing with one set of men, who knew your ways. (He was the same Myers who in former years had done so much of the great Pugin's work.) But, satisfactory as this was, Mr. Devey hated the contract system, with all the endless bickering and compromises, so often involved, and with the difficulty there always was in carrying out a new idea or a second thought. So having had experience of how successfully some things had been done by estate works (I think it was at Lord Vernon's, Sudbury Hall), arrangements were made and a system adopted whereby the client built on his own account. This worked well for years, and was carried out concurrently with contract works, in other cases and in the usual way, where the client wished it. Of course, this new departure entailed more work, for which an additional 2 per cent. was charged. In large and important works it was a great relief not to feel bound within the limits of a contract, although in all these cases a careful approximate estimate was given, but the chief advantage was to the client, where the work was better done and at less cost than by contract.

Distinguished Clients.

Although Mr. Devey was not a well-known man, it is interesting to remember what a number of distinguished people he had as clients. Here are some of them: Her Majesty the late Queen Victoria, the late Duke and Duchess of Sutherland, the late and the present Duke of Argyll, Lords Granville, Spencer, Lytton, Kenmare, Lucan, Revelstoke, De L'Isle, Dunraven, Strathnairn, Northbourne, Vernon, Cranbourne, Stratford, Tankerville, Cranbrook, Carlingford, Rothschild, the Countess of Waldegrave, and a number of others. He was a welcome visitor whenever he went, and an ornament to any society. Children were always fond of him.

The late Earl Granville, a most genial and charming man, who, as Ambassador, had been to all the great Courts of Europe, was a very good friend and client. He would call at the office and walk off arm-in-arm with Devey, consulting him frequently on various matters of taste. He had great faith in Mr. Devey's judgment and advice. When the Earl was Foreign Minister, Devey would often dine with him at Carlton House Terrace (where he had made considerable alterations and improvements), and afterwards attend the receptions at the Foreign Office.

Mr. Devey held that it was

The Duty of the Architect

to carry out the wishes and ideas of his client—after submitting his own—and he would never try to force his ideas on any one. In making additions to a house, he would generally carry them out in harmony with existing work, however simple that might be. He altogether objected to the display of new architectural patches, of an entirely different character, so often seen, and so much like the self-assertion of the superior person.

Most of you are no doubt aware of the excellent biographical essay on Mr. Devey by my friend Mr. W. H. Godfrey, which gained the silver medal of the Royal Institute of British Architects two years ago, and of his later essay on Mr. Devey and his work—republished from "The Architectural Review" by Batsford. And for those who do not know it, I may mention that there are three volumes of Mr. Devey's small sketches in the library of the Royal Institute of British Architects.

---

*Abstract of a paper read by Mr. James Williams before the Architectural Association on March 5th, 1909.

The Last Journey

Mr. Devey made was to the Earl of Kenmare's, at Killarney, one of his largest works, and then on to Lord Dunraven's, at Adare, about some proposed additions, during which time he contracted a serious cold, resulting in pneumonia, from which he died at Hastings in 1886, in his sixty-seventh year. Feeling the need of more rest, as years increased, he had bought a charming old house at the east end of Hastings—a house, it is said, once occupied by three Duchesses of Sussex and at the same time—with good panelled rooms of the early Georgian time, facing the sea and sun, with a paved terrace and a summer house at each end. The house had been put in order with the assistance of his old friend the foreman before mentioned—who was devoted to him—when the end came after a few weeks' illness.

In conclusion, it is now more than twenty years since Mr. Devey died, but anyone who knew him intimately could never forget the impression he made on them. No words can express his natural charm of manner and refinement. Quiet, modest, somewhat reserved at first, at times vivacious, alert, full of humour, of deep feeling and genuine sympathy, considerate, thoughtful, kind and generous—showing great indignation against all injustice, and the warmest approval of everything noble and good. To all about him, in whatever position, he was ever the true gentleman, and, in every sense, a worthy member of your noble profession.

Mr. Arthur Keen proposed a vote of thanks to Mr. James Williams, who, he said, had, like Mr. Needham Wilson, a fortnight before, produced a paper of high literary merit. It should be remembered, he said, that Devey was most prolific in his designs when architecture was at a very low ebb. Glancing through volumes of the professional papers of half-a-century ago, he had been surprised at the very poor examples of domestic work they contained. Coming almost immediately after this period of mediocre art, the work of Devey, naturally, was a revelation. He regretted that no plans of Devey's houses had been given, for they manifested a remarkable facility of treatment. Regarding the gardens, it struck him that the very formal style usually observable in modern work was entirely absent from Devey's designs. Some fine examples of his work were given in the "Architectural Review" (volume 21, 1907), in an article by Mr. Walter H. Godfrey.

Mr. Needham Wilson, in seconding the vote of thanks, said his earliest impressions were gained from the work of George Devey, of whom he always had been a sincere admirer. He thought it was a pity that Devey should have been of such a retiring disposition. His work had practically no educational influence on his compeers. He never published his work in the papers, and until recent years had been almost unknown.

Mr. W. J. H. Leverton remarked that the delightful paper to which they had been listening recalled pleasing reminiscences of the visits of the Association to various notable houses. Coombe Warren was particularly convenient to any of the students who might be desirous of seeing some of Devey's achievements. It stood near Wimbledon Common, amid beautifully wooded scenery, and a good view of the house could be obtained from the road.

Mr. Henry Tanner, jun. (vice-president) observed that the paper was rather an unusual one, dealing as it did more with the home life than the architectural life of the architect. He agreed with Mr. Keen that some plans of George Devey's houses would have been valuable assets to the paper. He believed that in this respect Devey deviated greatly from the right angle and the straight line.

Mr. James Williams briefly replied.

INCORPORATED CLERKS OF WORKS ASSOCIATION.

Annual Dinner.

The 26th annual dinner of the Incorporated Clerks of Works Association was held on Saturday, March 6th, in the King's Hall of the Holborn Restaurant, Sir A. Brumwell Thomas, F.R.I.B.A., presiding.

The usual loyal toasts having been honoured, Mr. H. J. Mills submitted the toast of "The Architects and Surveyors." Great architects, he said, had left us legacies of which as Englishmen we were proud; the surveyors were a necessity of the time, and their value to them was untold.

Responding for the architects, Mr. Paul Waterhouse, M.A., F.R.I.B.A., said: I am under a great obligation to you this evening, for you have given me for the first time in my life the opportunity of responding to the toast of architecture: that is, of representing for the moment the great art which I serve. Of my unworthiness so to do I am fully aware; but the unworthiness, though it increases my embarrassment, does not decrease the pleasure of the honour. I notice that at dinners such as yours the gentleman who responds for architecture is generally reported as delivering a speech full of important information. You must forgive me if I refrain from talking business to-night. I spend, as do my brother architects, a good deal of time in talking business with clerks of works, and should enjoy a change, so please do not expect from me any weighty utterance. I am reminded of the story of that Duke of Burgundy who, wandering at night through his city, found a labouring rustic in heavy sleep. I compare myself for a moment with that slumberer—not too literally, for the man, I fear, was drunk, and I happen to be a water-drinker—but because of what followed. The Duke and his courtiers took the man to the palace, laid him in the Duke's bed; when he woke mystified in the morning, dressed him in ducal clothes, and paid him for a day the homage and honours due to an exalted personage. In being al-

THE NEW PALACE OF JUSTICE, ROME.

This building, which has cost 40,000,000 francs, is practically complete. It faces the River Tiber on the Place Cavour. The statue of Cavour has, however, been misplaced by the erection of the new building, and will probably have to be turned round.

lowed for a few minutes to stand before you as the representative of architecture, I accept and enjoy the unmerited honour much as that rustic may have done. I have been thinking of the many and various duties that fall to a man on the ground that he is an architect. [The speaker here produced a fragment of a list which he suggested might have been drawn up in his office, representing the incongruous knowledge that an architect is sometimes supposed to possess, and ranging from the theory of acoustics and the law of light and air to the extermination of blackbeetles!] To this (he continued) we must apparently add as an architectural accomplishment the spoiling of good dinners with bad speeches. But I forgive you for thinking, as others do, that an architect must necessarily be a speaker, because I value the opportunity of representing my art, and acknowledging most cordially its indebtedness to your craft. . . I acknowledge that if our duties are multifarious, yours are multifarious too. I am not, it is true, one of those who think it the duty of the clerk of works to make the full-size details and design the back elevation; but I do know, and very gratefully acknowledge, that there are in every building of importance hundreds of questions of technical significance in which the clerks of works renders his colleague the architect infinite help. . . It is only by your help that the architect is enabled to be what his name implies—a master workman—for you are the essential medium, on any large building, between him and his craftsmen.

Mr. H. J. Leaning, F.S.I., replied for the surveyors, and said that among the different types of clerks of works was the despotic clerk, usually appointed by a municipal body, and whose name was mentioned with a hush. The difficulty arose from the fact that he was appointed directly by the employer instead of by the architect, as all clerks of works ought to be. He (the speaker) looked forward to the time when there would be a qualification for membership of this Association, which ought to be a guarantee to architects of the efficiency of the men who were members of that body. He also hoped that before long there would be an increase in the salaries of clerks of works.

The toast of "The Builders" was submitted by Mr. R. H. Kellond, P.P.I.C.W., and in responding, Mr. J. Carmichael, president of Institute of Builders, said he was there first of all to do honour to their president, Mr. Fincham, as to whose great ability he was glad to testify. He was also delighted to be present to meet the members of the Association, one and all. Builders came in contact with these gentlemen every day, and he considered this Association to represent the cream of the clerks of works in London.

The toast of "The Worshipful Company of Carpenters" was submitted by Mr. J. G. Peacock, P.P.I.C.W., who said the Carpenters' Company were among the best friends of this Association, and were doing splendid work in the matter of technical education.

Mr. Maurice Hy. Pocock, the master of the Carpenters' Company, in responding, said he felt himself almost an anachronism in being present, because the Carpenters' Company was one of the most ancient of the City companies connected with building. The Company encouraged young men from all over the country to come and listen to their numerous lectures. He thought the one drawback to building in this country was by-laws, and he rather wished the old days of the Carpenters' Company "viewers" were back again.

The toast of the evening, "The Incorporated Clerks of Works Association," was proposed by the Chairman. They were, he said, all agreed that in the practice of architecture, in the carrying on of all that was best in the traditions of good building, there was no more pleasurable occupation in the whole field of the world's work. They all knew that beyond the pleasure in accomplishing something, which could be shown as a result, there lay, deeply implanted in mankind, what was called the instinct of workmanship, an instinct of keen pleasure in doing a thing, quite apart from the result obtained, and among the influences that had raised this simple instinct of doing a thing into the region of the ideal must be counted all those guilds and associations of men who had in all ages banded themselves together for the promotion and advancement of the art or craft to which they were specially devoted. Such an association was founded some twenty-seven years ago in the office of Sir Geo. Gilbert Scott, and it was his pleasure that evening to give to them the toast of the Association. The Association was formed for the promotion of good work and uniformity of practice in securing good work, but the constitution went still further and provided for intimate association among them in assisting one another with the difficulties that occurred in their work. They all knew these difficulties, and both they and he could look back upon work that they had carried out with pleasure, because tucked away in these buildings were the solutions of many practical difficulties with which they had had to cope. As they had before them that evening the first Benevolent balance sheet, showing a balance on the right side, he thought they might congratulate the Association on the position that it had achieved, and the only thing to wish was that the position might be maintained, and that the usefulness of the Association might be more widely promoted. The one matter uppermost in their minds was the question of succession, and those who were to follow after, the younger men who were to carry on the work that they were now doing. They had only to open their doors sufficiently wide to admit these younger men, and he believed they would have all the zeal and enthusiasm for their work and their Association that they required. The principles of construction and design saw many changes in these days, but he trusted that posterity would find in what they were doing to-day something that was a worthy link in the chain of the tradition of architecture. They did what was in them to do, and trusted that it would be accounted good. Might the next year bring better trade, good times for them all, and above all, prosperity to the Clerks of Works Association and its Benevolent Fund.

The toast was heartily responded to, and the President of the Association, Mr. A. Fincham, in acknowledgment, said he wished to express his personal gratitude to Sir A. Brumwell Thomas for his kindness. The question of the age of membership of the Association had always been a disturbing element, but his own observation of life's activities showed him that man's achievement was not always regulated by man's years. Unfortunately, the clerk of works was almost an exception to the rule. In their Association a few years ago, a man was considered too young at the age of 35, and had to be between 40 and 60 for some people's taste. He did not believe that himself. In most of the activities of life there was room for the old and the young. They had for years tried to get the best men in their ranks, and had sometimes lost sight of the fact that good men were to be found amongst the young ones. Well, they were going to try to get the younger men in now. He looked upon the Carpenters' Company as a sort of generating station, generating enthusiasm amongst young men and teaching them to become good craftsmen; and he liked to look upon their own Association as a sort of main distribution board, distributing the potent current that flowed from the architect's mind to the craftman's tool, and from the craftsman's tool to the acquired object; and he believed, with the Chairman, that if they tried to get the younger men amongst them they would find the enthusiasm at once. If any of those present wished to contribute to the pension fund, he hoped they would not do it because the members were old and incapable; it was to assist those men who had done good work and deserved some reward. The members of the Association, he thought, looked upon the love of their work as some sort of reward, and they sometimes thought too much of their work and too little of their pockets. Personally, he hoped it would continue to be so, because he wanted their young men to be imbued with the spirit of British craftsmanship which existed in their Association.

Other toasts were "The Visitors," proposed by Mr. J. Williams, vice-president of the Association, and replied to by Mr. Walter Cave, F.R.I.B.A., and Mr. Wm. Woodward, F.R.I.B.A.; "The Press," proposed by Mr. J. Brady, who paid a tribute to "The Builders' Journal," which, he said, "does good work in that wretched concrete business; it gives splendid information in connection with the work;" and "The Chairman."

Lecturing on farm-building construction before the New Deer (Scotland) Literary Association, Mr. James Cobban, architect, went back to Jabal's tent, the cave dwelling, and the crannog, and traced the gradual development of the buildings of the present day.

* * *

At a recent meeting of the London County Council, Mr. Greenwood, in answer to a question, said that the Royal Albert Hall had not been inspected by the Council as to its safety in case of fire. The Council had no jurisdiction to make such an inspection. He thought it would be well if such a large public building was, in the public interest, put under the same regulations as buildings under the licence of the Council.

* * *

The Council of the Surveyors' Institution have decided that after the election of members to be held in October, 1913, no examination candidate shall be eligible for election as a professional associate unless he has passed both the intermediate and final examinations of the Institution. As a consequence of this change, after the present year candidates for the intermediate examination will be allowed to sit at the age of nineteen, and for the final examination on completing their twenty-first year.

* * *

Stirred by the accounts of the ravages of tuberculosis, Mrs. W. K. Vanderbilt has given sufficient money to build four six-storey tenement buildings, to house 350 families, on the East Side of New York. These tenements are to be built on the latest design to procure light and air, and medical direction will be at hand to design accommodation specially fitted for the treatment of consumption. There will be extensive balconies, gardens, and ample air shafts to the interior of the buildings. It is the wish of Mrs. Vanderbilt that the rents shall be low enough to be within reach of the poorest, though it is hoped that the tenements will be self-supporting.

* * *

At the fourth ordinary meeting of the session of the Aberdeen Association of Civil Engineers, a paper, entitled "Notes on Cement Concrete," was read by Mr. J. W. F. Gardner, M.Inst.C.E., Caledonian Railway, Glasgow. Mr. Gardner referred to the importance of thoroughly testing the materials employed for making concrete. The cement should conform to the requirements of the British Standard Specification, and the author emphasised the importance of fine grinding the cement and of insisting upon the mortar tests in preference to the neat cement tests. The aggregate, consisting of sand and broken stone, should be as dense as possible, and the influence of the size of the grains of sand upon the voids in the mortar, and consequently upon the amount of cement required was shown by several tables. The author compared the strength of whinstone, granite, gravel, bricks, and other materials, and referred to the advantage of using machine-broken stone over hand-broken stone, on account of its lowest cost. The advantages of wet and dry mixtures for concrete were then referred to, and the necessity of thorough ramming and of careful inspection was insisted on.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Proposed Roof Truss.

YORKSHIRE.—A YOUNG ARCHITECT writes: —I enclose a tracing (not reproduced) for a roof which is proposed to be used over a recreation room in a club. Will you tell me whether the same is weak, either in the scantlings or constructionally. If so, will you be kind enough to say where, and suggest a size or sizes to be strong enough for the purpose? As to the pier, would it weaken it much to have a recess about 1¼ in. deep to take window frame.

The proposed roof is altogether too light in construction, and not well arranged, and the piers are insufficient to withstand the thrust of the roof. This is proved by working out the stresses as follows: Fig. 1 shows proposed trusses 26 ft. span, 8 ft. centre to centre; Fig. 2 the frame diagram with the addition of a king bolt, the external loads and the stresses being marked on. Fig. 3 polar diagram to give funicular polygon on Fig. 2, and obtain reactions. Fig. 4 the reciprocal stress diagram, allowing for a structural load of 28 lbs. per square foot and normal wind pressure of 21 lbs. per square foot. Fig. 5 shows the side elevation of pier with thrusts and loads. From calculations it appears that the maximum stress on the principal rafter would be nearly 70 cwt. per square inch, whereas the working stress should not exceed 6 cwt., and with regard to the piers, the maximum stress would be nearly 25 tons per square foot compression and 20 tons per square foot tension, whereas the working stress in tension should not exceed 3 tons per square foot. The calculations are as follows:—

For the principal rafter with a maximum compression of 85 cwt. and maximum bending moment of 199 cwt.—ft. = 2388 cwt.—in.

$$\frac{W}{A}+\frac{M}{Z}=\frac{85}{36}+\frac{2388}{\frac{1}{6}(6\times6^2)}=2{\cdot}31\pm66{\cdot}33=68{\cdot}64$$

cwt. per sq. in. compression. For the pier

$$\frac{W}{A}\pm\frac{M}{Z}=\frac{63}{1{\cdot}45}\pm\frac{63\times2\frac{1}{4}}{\frac{1}{6}(1{\cdot}12\times1{\cdot}3^2)}=43{\cdot}4\pm447{\cdot}4$$

= 490·8 cwt. or 24·54 tons per sq. ft. compression and 404 cwt. or 20·2 tons per sq. ft. tension. The whole scheme must be revised throughout.

HENRY ADAMS.

Designing a Sunday School.

To a question received from H. E. W. (Tottenham, N.) Professor Adams replies as follows:—

A proper plan, drawn to scale, should have been submitted. The sketches are so rough that it is impossible to make out what is required or where it is to be placed, and from the notes on the section it is more than doubtful whether it would be right to assist the correspondent. The only leading dimension given on the sketches is the span of the school roof, which is marked "about 60 ft.," and it is shown as a king post truss with two extra braces abutting on an unsupported part of the tie beams. Almost any book on building construction would give the elevation and scantlings for a satisfactory roof of this span. The girders cannot be calculated without knowing the extra distances of the piers between the windows, which are required to strengthen the walls. The paper by Mr. H. T. Buckland, on "Planning of Schools," given in this journal on the 10th and 17th February may be found useful.

Construction of Cesspool.

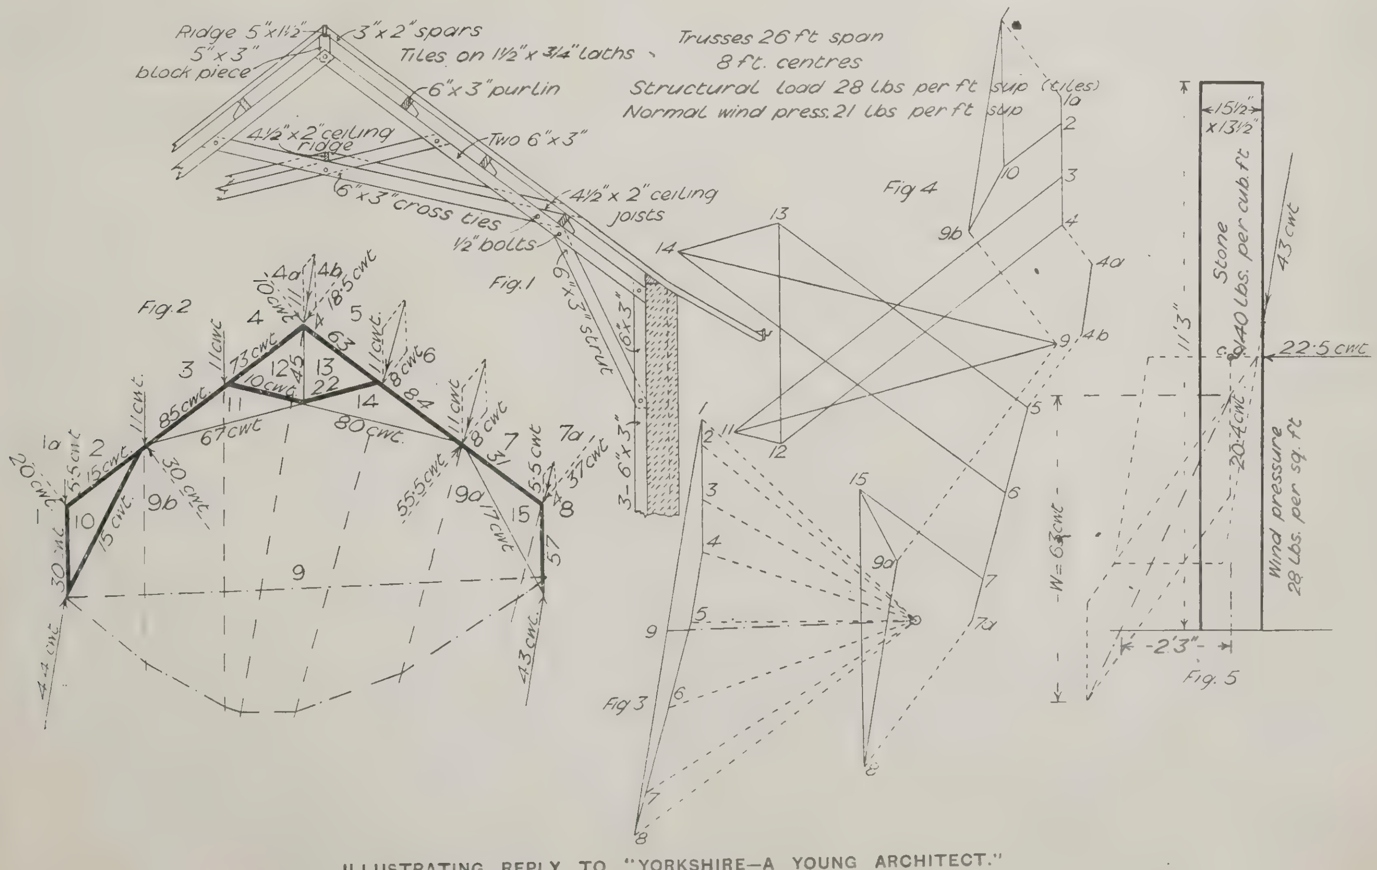
MORPETH.—W. H. writes: "Would you give me your idea of the best cesspool most suitable for the drainage of a country house?"

A cesspool for a country house should be on low ground, at least 50 feet, and preferably 100 feet, from the nearest point of the house, and from any water storage tank, deep well or stream. It should be steined with brick in cement 9in. thick, rendered inside with Portland cement (1 cement 1 sand) 1in. thick, or have 9in. thickness of puddled clay outside. It should be about 6ft. internal diameter and 10ft. deep, the top courses gathering over towards the centre so as to finish with an air-tight manhole ring and cover about 2ft. diameter. The bottom should be brick paved and rendered in cement. Near the top a 2in. vent pipe should be put in, to avoid the possibility of internal pressure, and carried up a height of not less than 10ft. plus an additional height equal to any horizontal length that may occur before it rises up. This pipe may be secured to a wall, or any old tree, except an elm, poplar, or fruit tree. An intercepting trap should be placed in the line of pipes near the cesspool, but it is not necessary to provide a fresh air inlet so as to have a constant current of air passing over the cesspool. If constructed as described above, anaërobic bacterial action will go on and liquefy the contents better than if thorough ventilation takes place. A pump should be fixed in a convenient position for pumping out the liquid contents and distributing them over the land, a float with iron rod being arranged to indicate the level. In all probability the cesspool would not require opening for seven years if the bath waste were excluded. This may be discharged into a dry steined well, and allowed to soak away.

HENRY ADAMS.

Foundation to Walls.

WOODBRIDGE.—TOBURG writes: "In your issue of February 10th, Mr. Adams suggests



ILLUSTRATING REPLY TO "YORKSHIRE—A YOUNG ARCHITECT."

a general rule for the thickness of concrete to foundations. There are several rules of thumb for obtaining this, but I should be obliged if you would give me a sound reasoning by both formula and graphics, such as would be accepted by a Court of Law as a just reasoning for obtaining this depth and also footings; in walls having footings both sides, and also all footings one side, as in the case of a wall next an adjoining property."

The concrete in foundations has two elements for calculation, horizontal area and depth. The area is so proportioned that the pressure on the soil below shall be within the limit of its supporting power, and the depth is made sufficient to prevent the edges from being broken off by a cantilever action. In general this is obtained by making the concrete 12 inches wider than the lowest course of brickwork (6 inches on each side), and not less than 9 inches thick. It will only be required thicker than this when it projects more than 6 inches or it is necessary to sink lower to reach a firm substratum. In the North of England brick walls are often built upon concrete "founds" without footings, but never in the south. The London Building Act is taken as a guide, the number of courses is equal to the number of half-bricks in the thickness of the wall, each projecting 2¼ inches on both sides, so that the bottom course become twice the width of base of wall. When the footings are on one side only of the wall the pressure is not uniformly distributed, and it may be necessary to make special calculations.

HENRY ADAMS.

Strength of Church Roof.

PRITTLEWELL.—A. B. writes: "Please state whether the roof shown in the accompanying sketch would be sufficiently strong."

The elevation of the proposed roof, with corrected details of joints, is shown in Fig. 1. The frame diagram will then be as in Fig. 2; and taking the structural load at 28lbs. per foot super, and the horizontal wind pressure at 42lbs. per foot super, the loading will be as shown and the reactions found as in Fig. 3. Owing to the form of truss, the dotted virtual forces must be introduced, the stress diagram Fig. 4 drawn out, and the stresses scaled off. For the principal rafter, with a stress of 125cwt. and a maximum bending moment of 84 by 5 by 12 = 5,040cwt.—in., try the 5in. by 20in. combined section given by querist.

$$\frac{W}{M} \pm \frac{M}{Z} = \frac{125}{100} + \frac{5040}{\frac{1}{6}(5 \times 20^2)} = 1.25 \pm 15.12 = 16.37$$

cwt. per sq. in. compression and 13.87 cwt. per sq. in. tension. For the 5 in. by 10 in. curved tie

$$\frac{W}{A} \pm \frac{M}{Z} = \frac{104}{50} + \frac{104 \times 19}{\frac{1}{6}(5 \times 10^2)} = 2.08 + 12.48 = 14.56$$

cwt. per sq. in. compression and 10.4 cwt. per sq. in. tension.

If the truss is made of solid oak, the maximum allowable stresses with a factor of safety of 4 are 14cwt. per square inch compression and 13cwt. per square inch tension taking net section. The scantlings may, therefore, be considered as just sufficient for a slated roof in a sheltered position; but if the position is exposed or the roof covered with tiles, the scantlings must be increased 1 inch in thickness, making them all 10in. by 6in. The curved timbers will require to be bent, or cut out of compass timber. Laminated members are not suitable for the stresses.

HENRY ADAMS.

Property in Old Material.

HEREFORD.—H. S. writes: "I thank you for the answer you have given to my query on page 184 of your issue of March 3rd, but the answer still leaves grave doubt in the matter, and as the question of "old material" is of special importance in many contracts, would it be too much to ask you to ventilate the subject? No doubt many architects and builders have had experience with old materials which would prove helpful in settling the question. "F. S. I." says that no doubt the contract must have been loosely drawn, but this was not so. The old material was of such a trivial nature that it did not seem worth drawing up any special clauses for. Still, the same difficulty arises as to the ownership of old material, whether in large or small quantities, when not specially mentioned in the contract, and the rightful ownership of same leaves great doubt, which it would be well to have thrashed out."

I fear I can add little or nothing to what I said previously upon this subject. I certainly think that if the building owner wished to reserve the old materials, or any part of them, his architect should have inserted a clause to that effect in the specification, or contract. To tell a contractor to clear the old materials away presumably means that he is to find a place to take them to, and that they are of no value to the owner any longer.

F. S. I.

Fungus Growth on Floor.

NOTTS.—SUBSCRIBER writes: "Having had considerable trouble with a boarded floor, owing to a fungus growing underneath, we cleared it all out of the joists, bonds and floor-boarding, and concreted the whole area 4in. to 5in. thick, laid wood joists in concrete, brought all up level, and laid the new floor-boarding on these joists. After two years the fungus is now showing again. Please advise."

The growth of this fungus is purely due to the absence of ventilation under the floor; though, perhaps, the boards have been also covered on top with some more or less air-tight covering—such as oil-cloth or linoleum. I fear I can suggest no remedy for the present state of affairs—the only thing that appears to have been possible to do (beyond what actually was done) when laying the floor, was to place the boards on tar, the joists being placed completely in the concrete were bound to rot, it was only a question of time.

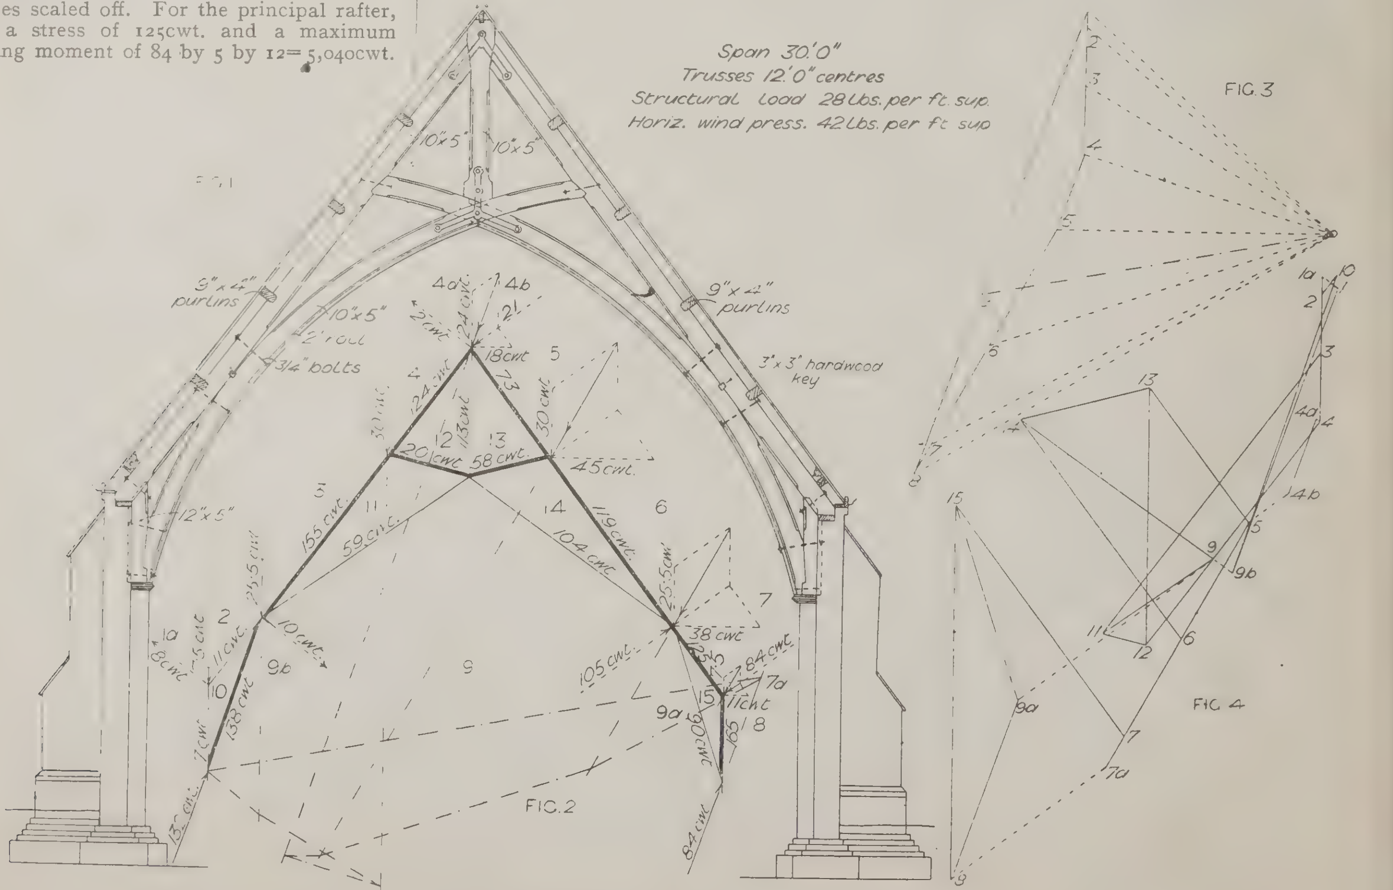
F. S. I.

Bankrupt Members of Local Authorities.

PROVINCIAL.—X. Y. Z. writes: "What is the position of an undischarged bankrupt (adjudication in 1899) elected a member of an urban district council last year? Is he eligible to sit on the council? If not, is he liable to penalties? Are the motions on which he has voted rendered null and void by reason of his being ineligible?"

I think the disqualification ceased five years after adjudication (Local Government Act, 1894, S. 46 (1) c.). The councillor was therefore eligible last year, and is not liable to any penalties.

B.



ILLUSTRATING REPLY TO "PRITTLEWELL.—A.B."

Architectural Societies.

Liverpool Architectural Society.

At the sixth ordinary meeting of the Liverpool Architectural Society, held on Monday, March 1st, in the rooms of the Society, 13, Harrington Street, Mr. H. Inigo Triggs delivered a lecture on "The Planning of Squares and Open Spaces."

The presence of an unusually large audience testied to the interest recently aroused in the subject by Mr. Lever's munificent donation to the School of Architecture of the Liverpool University, for the purpose of studying city planning.

The minutes of the previous meeting having been read, the President, Mr. F. G. Eccles, F.R.I.B.A., called upon Mr. Triggs to deliver his lecture.

After a consideration of the Greek and Roman methods of designs in fora and market-places, and the traditional survival of the system in some of the modern towns in Southern Europe, where there is a tendency to concentrate distinctly the important public edifices and to ornament the centres of common civic life with monuments and sculpture, the lecturer proceeded to contrast the salient characteristics of the Mediæval and Renaissance places—the general haphazard composition of the former, and the studied regularity and balance of the latter.

It was not till the beginning of the 17th century that the classic idea of symmetry was revived, one of the earliest instances of its practical application being the Place des Vosges, in Paris, laid out under Henry IV., when the form of a square was adopted. But, once initiated, the practice of designing regular open spaces, surrounded by uniform architecture, rapidly spread, and was soon imitated in England, where, in 1618, Inigo Jones was commissioned to lay out Lincoln's Inn Fields. In Italy itself, almost the first example was the colonnaded approach to St. Peter's, at Rome, between 1655 and 1667. Its elliptical form, essentially a classic conception, descended in direct line from the circuses and ancient amphitheatres, was copied in many Italian towns: the Piazza del Plebiscite at Naples, and the Piazza S. Nicolo at Catania, are perhaps the best known instances.

Mr. Triggs next dealt with the planning of modern "Traffic Places"—*i.e.*, places which are designed to deal with streams of traffic at points where several streets converge. The first essential of such places, whether of the simplest type, consisting of only two intersecting thoroughfares, or the most complex, including islands, is that they should absorb and distribute the various lines of traffic readily, and should properly provide for the safety of pedestrians.

From diagrams by Eugene Hénard, it was demonstrated that, in order to obviate the risk of collision at a traffic place, the gyratory system of circulation was the most satisfactory, though no attempt has been made to test it in this country.

A century ago the invention of the rond point (which seems to have owed its origin to French garden planning of the 17th century) appeared to be the great solution of the traffic-place problem, but the idea, though architecturally, and on paper, a fine one, is unsatisfactory in actual action. Even the largest example, the Place de l'Etoile, though relieved by a subsidiary outer traffic circle, is frequently impassable.

A discussion of the comparative values of circular, oval, square and other forms in place design, brought Mr. Triggs to the concluding portion of his lecture—the treatment of garden-places, the class of open space laid out solely for the purpose of a garden, and called in London, squares. For such a city garden the formal treatment is, of course, the only one to be considered seriously: it must be designed in direct relation to the surrounding architecture, and any embellishments, such as stone steps or terraces, fountains or statuary, must be parts of the scheme, making it a complete whole. There should be a fixed number of sites for future use, the utilisation of which completes the original design and excludes the possibility of future introductions. Usually the placing of statuary is quite a farce, and appears an obvious afterthought.

The lecture terminated with the suggestion for the formation of a Civic Improvement Committee, the architectural members of which could use their influence to further the beautifying of Liverpool.

Prof. Reilly, in proposing the vote of thanks, said that improvements might be expected in the character of the future development of the city: the establishment of a Chair of Town Planning at the University would arouse public interest in the subject, and the publication, from time to time, of ideal drawings for Liverpool and other towns made by the professor to be appointed, could not fail to result in an improvement of the existing state of affairs.

Mr. Rathbone, in supporting the vote of thanks accorded to Mr. Triggs, expressed his opinion that the present Liverpool Corporation were not utterly impossible of access on the question, though he confessed they were a little difficult; as, for example, when a deputation approached the city engineer with regard to the unworthy appearance of the Landing Stage entrance, the latter replied that it was built of the best bricks. Still, Mr. Rathbone thought that if sufficient social pressure were brought to bear, some improvement might be effected.

Gloucestershire Architectural Association.

The February meeting of this association was held at Gloucester, the president (Mr. H. W. Chatters) in the chair, when Mr. M. H. Medland read a paper entitled "An Account of the Roman and Later Buildings Found on the Site of the Wilts and Dorset Bank, Gloucester," which was illustrated by lantern slides. Commencing with the remains of the Roman basilica, Mr. Medland described as far as possible the successive buildings that have stood on this historic site, the Saxon and Early English churches replaced by that of All Saints' of the 14th and 15th centuries, and succeeding these the later civic buildings of the 16th, 17th and 18th centuries. Numerous slides of the architectural and other remains of all the buildings were shown, amongst which may be mentioned as especially interesting those of the Roman figures, the early mediæval ornaments, and the 17th and 18th centurty Tolseys. The lecturer also gave much historical information as to the history of the city connected with these buildings, and mentioned that the copper Sanctus bell of one of the churches is now in Exeter Museum. Discussion followed, after which, on the proposition of Mr. F. H. Bretherton, seconded by Mr. T. Malvern, a hearty vote of thanks to the lecturer was passed.

Obituary.

The death is announced of M. Alfred Normand, the *doyen* of the Académie des Beaux-Arts. Born in Paris on June 1st, 1822, M. Normand was entered in 1839 at the Ecole des Beaux-Arts as a pupil of his father, M. Henri-Marie Normand, the architect and engraver, and was awarded in 1846 the *grand prix* in architecture for designs for a natural history museum; and his "Study and Restoration of the Roman Forum," made in 1850, was admitted to the Universal Exhibition of 1855, and awarded a medal of honour. Appointed sub-inspector of public buildings, he completed, between 1855 and 1857, the Pompeian house, constructed for Prince Jérôme Napoléon in the Avenue Montaigne, and in 1873 he re-erected the Vendôme Column, which had been destroyed by the Communists. Later, he built the hospital of Saint-Germain-en-Laye. He was an officer of the Legion of Honour, and it was in 1890 that M. Alfred Normand was elected member of the Académie des Beaux-Arts.

Views and Reviews.

The Art of the Plasterer.

The Art of the Plasterer. An account of the Decorative Development of the Craft, chiefly in England, from the XVIth to the XVIIIth Century. By George P. Bankart, Architect and Craftsman. London: B. T. Batsford, 94, High Holborn. Price 25s. net.

Mr. Bankart will, it is hoped, forgive the gracelessness which finds itself unable to share his regret "that an art so extremely interesting and unique as that of the plasterer should have escaped record and consideration in any collected form at the present day"; for one feels it was worth while waiting till he should, in good time, take his task in hand himself, and give us his special knowledge of the art.

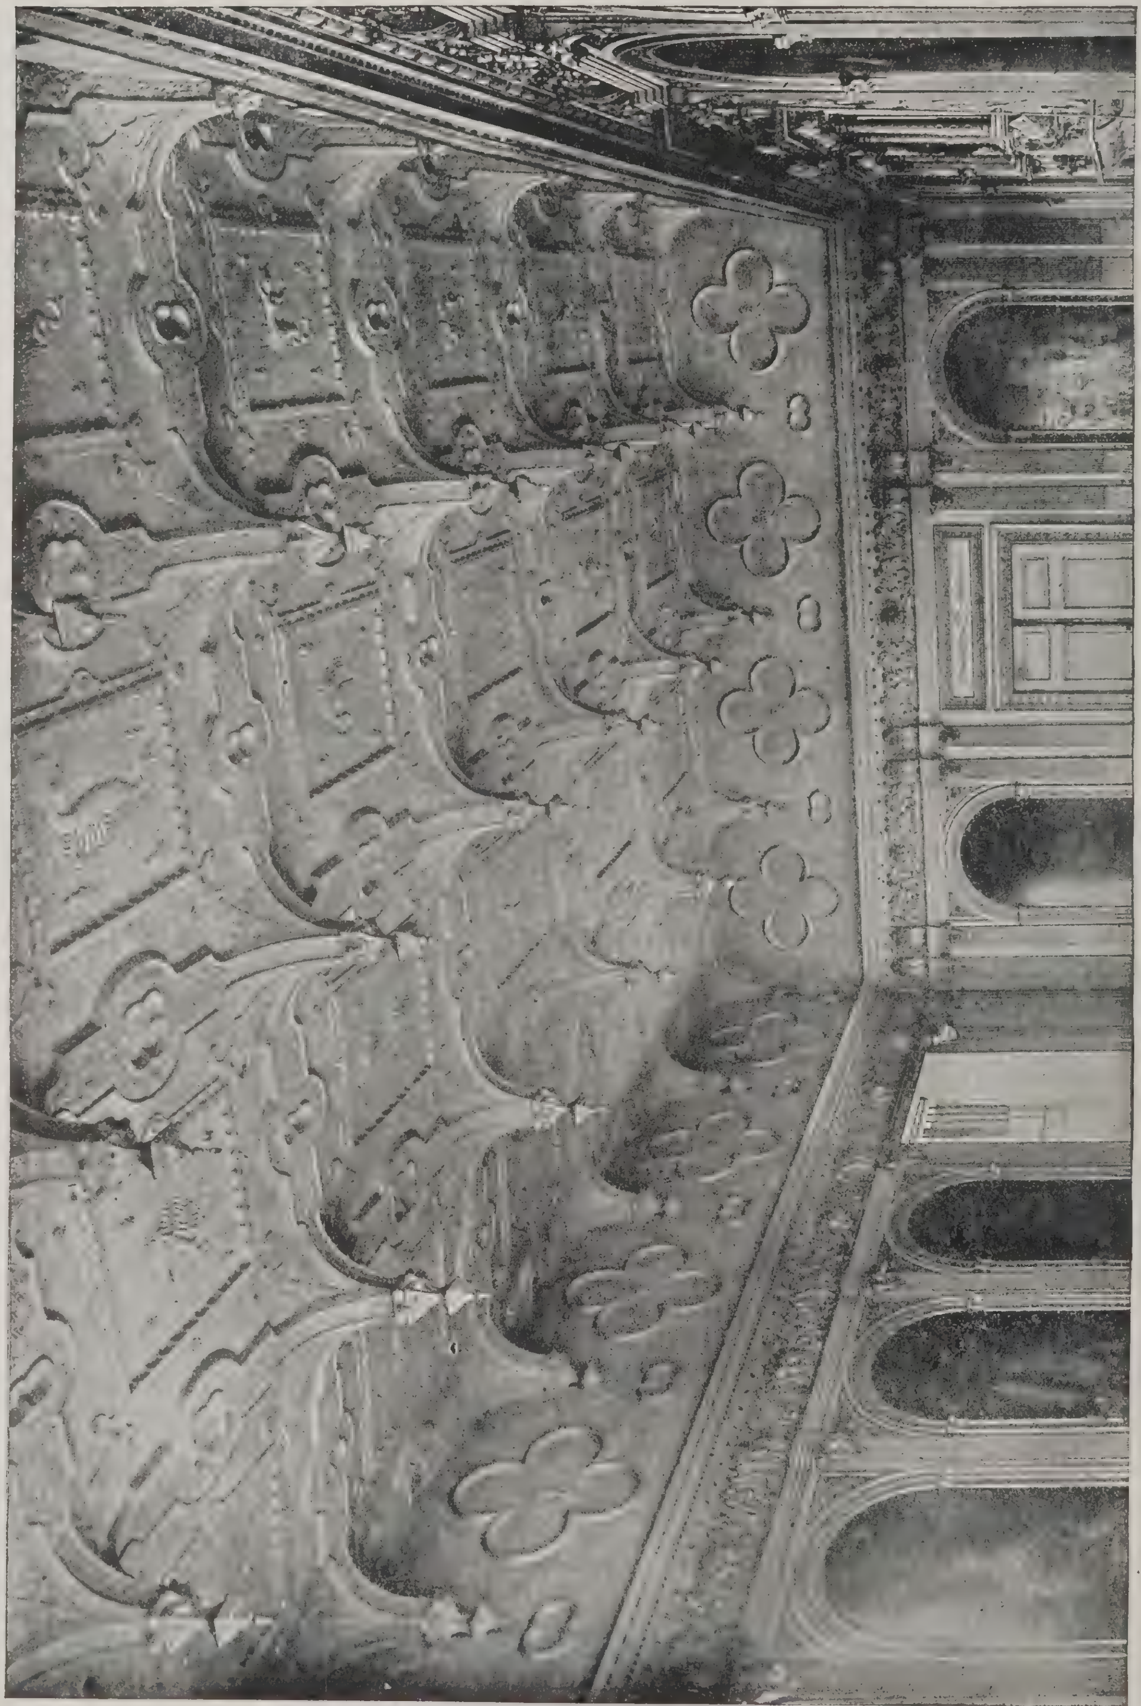
In the preface the author pays a fitting tribute to Mr. Millar's book, "Plastering, Plain and Decorative," and in his entirely needless apology for writing the work now under review, he draws attention to the fact that the former deals more particularly with the technical side of the art. In the recently published volume, Mr. Bankart has given us a most interesting historical survey of the subject.

The introduction (Chapter I.) reflects the author's hope and belief that the present reawakening of the handicrafts connected with the great art of building will give an impetus to "Plaster," as a medium of decorative expression. This is a wholesome start, and is a point of view seldom taken by writers on ancient crafts, who, by sounding the note of despair, do a great deal of mischief in the direction of making people believe that nothing modern can ever be good. But Mr. Bankart is careful to stipulate that a full knowledge of the capabilities of the material on the part of men with refined ideas, is a necessary condition to a revival of the plasterer's art.

A material which, in the author's words, "is intensely susceptible to every touch received from the hand of the worker" and "can be modelled, cast, incised, coloured, stencilled, or stamped with equal freedom, from the size of a cameo to the vastness of a dome," is one which surely provides a generous scope in its application. Instances of its use in ancient times for mirrors are also on record, and the inevitable Pliny mentions its employment by goldsmiths of early times for the sinking of "dies," in preference to wax. So delicately can it be manipulated, that at Pompeii are to be seen numerous examples of modelled stucco in such low relief that it is hardly greater than in the lacquer-work of the Chinese. Vitruvius, who was nothing if not thorough, has a good deal to say about its preparation, and the recipe in use in his day includes such ingredients as juice of figs, rye-dough, hogs' lard, curdled milk, blood, etc. These and many other most interesting facts concerning the "stucco-duro" of ancient times may be read in greater detail in the chapter devoted to this period of its history.

Chapter III. describes how the Italians of the fifteenth century, in seeking for sculpture of classic times, discovered, as a result of excavations amongst the ruins of the Baths of Titus, that the walls were covered with fine paintings and stucco work, of which nothing was hitherto known. This led to a revival of the art, to which the experiments of Giovanni da Udine owed almost everything, for it was he who produced a material similar in nature to the old, and left for posterity a proof—in his decorative work at the Vatican—of his mastery over it.

"Stucco-duro in England" is the title of the next chapter, which gives a short account of the work of the foreigners invited over to this country by Henry VIII. Their influence soon made itself felt, the result being that though the native craftsman showed ignorance in handling the human figure, he developed an extraordinary versatility in ornament, and in course of time the way was paved for the evolution of a national style suited in every way to our environment and habits of life.



THE "FISH" ROOM—CEILING, AUDLEY END, ESSEX. *From* "The Art of the Plasterer.")

Subsequent chapters lead up to a description of the English School of Plasterwork (Chapter VII.). By this time the material (stucco-duro), owing to various difficulties in obtaining and working it, was superseded by ordinary plaster or mortar. As a consequence, the native plasterer soon responded to the new conditions, and in the remotest villages very creditable attempts were made to decorate the ordinary homes of the people. The foreign expert had disappeared, and the art he left behind became, in the hands of humbler workmen, more closely identified with the national life. In the earlier years of this school, little more was attempted in the way of ceiling decoration than easily repeated patterns of panelling formed by moulded ribs of plaster. The mouldings were of simple section, as will be seen by reference to Fig. 127 in the volume. With experience grew ambition, and our old mansions illustrate the degree of perfection and exuberance the art of plastering at length achieved. Ceiling ribs were now double-moulded, and contained within the intervening spaces, running enrichments; pendants also made their appearance, and added much grace and richness. A very beautiful ceiling (formerly in the Old Palace, Bromley-by-Bow) may be seen at the Victoria and Albert Museum, in which these features are conspicuous.

Chapters on Scottish and Irish Plasterwork—both exceedingly good—precede a very exhaustive account of the plasterwork of the Later Renaissance. This was frankly Classic in feeling, and seems to have been introduced (to a large extent) by Inigo Jones, who derived it from Italy. He made use of moulded ribs of much greater size than had formerly been the custom in Elizabeth's time, and the panels were necessarily of simpler form and larger dimensions. Italian workmen were employed—as well as English—and the name of Nicholas Stone (among the latter) is mentioned. Typical London examples of this period are those at Ashburnham House, Westminster; and several of the City churches, notably St. Stephen's, Walbrook, and St. Swithin's, London Stone. Provincial examples are very numerous—among the best being the very rich work at Belton House (Grantham, Lincolnshire).

Mr. Bankart includes a chapter on "The Eighteenth Century Degeneration," and points out the inferiority of plasterwork generally from the death of Wren onwards. The variety and vigour of the work done under him were almost entirely wanting in that executed under his successors. Following in the wake of this degeneracy came yet another invasion of Italians, and the style of the French Court (Louis XIV. and XV.) became the fashion of the day. The author quotes a passage from a vigorous protest written in 1756 by the architect Ware, who considered this particular class of design "little less barbarous than Gothic." This was the age of the treatise on building—illustrated with copper-plate engravings—showing the manner in which every conceivable ornamental form was to be set out, in rigid, unvarying proportions, based on that most unaccommodating and inspiration-sapping invention—the module. The plasterers, like every one else, slavishly following these instructions, helped to lower the general standard, and their work was meaningless and mechanical in consequence.

The brothers Adam have a chapter to themselves. The outcome of close study in Italy, their work was largely borrowed from Rome, and, although it lacked inventiveness, we can agree that it was unquestionably "graceful and refined in design, delicate and subtle in modelling, though somewhat feeble in its relief." It is unpleasant to have to note that these gentlemen were financially interested in a special compound which they used in their work in such vast quantities.

Coming to our own times, we have in Chapter XIII. a description of modern plasterwork, in which are included illustrations of some very charming work executed by the author. It is interesting to observe, however, that though Mr. Bankart prefers broken-backed circles and distorted ceiling ribs to the more accurate work of the present time, his own work is quite normal in both respects, and where flowing ribs occur they do not appear to be other than perfectly graceful. It is very difficult to believe that the old-time craftsman was other than an indifferent workman, doing his very best under the circumstances.

The author illustrates (in colour) a portion of a modelled and coloured frieze executed by himself, and describes the method he employed. To those engaged in practical work as plasterers this should prove of value and interest. Judging from the illustration, the original must be exceedingly pleasant as a colour scheme.

A chapter of "Notes addressed to Students and Apprentices" concludes the book, which is one that can be described as essential to architects and plasterers. Its most conspicuous feature is the profusion of illustrations (many of them being from scale drawings), all of which are good, and of sufficient size to be of real use. The author and publisher are to be congratulated on the production of a most important work.

Popular Electricity.

Popular Electricity. By Walter Hibbert, F.I.C., F.C.S., A.M.I.E.E., Lecturer on Physics and Electro-Technology at the Regent Street Polytechnic. With about 200 illustrations. 3s. 6d. Cassell and Company, Ltd., London, New York, Toronto and Melbourne.

If the architect does not, like Bacon, take all science for his province, he must at least know something about electricity. This book offers "a bird's-eye view of the many applications of electric energy," and the intrusion into its title of the suspicious word "Popular" must not be taken to imply, as, in too many instances it does, purely superficial treatment. This is, indeed, a book from which all but the professional expert may learn a great deal that is useful and interesting with respect to the electrical methods by which, as the author remarks, "so many industrial occupations are now invaded." The book is fully illustrated with useful diagrams, which really elucidate the principles involved; and altogether it can be recommended as providing the means of an intelligent general understanding of the subject.

The Use of the Slide Rule.

Handbook for the use of the Slide-Rule. With special instructions for the "Reitz" Pattern. By A. H. Angus, B.S., Head Master George Dixon Secondary School, Birmingham. Published (price 6d.) by B. J. Hall and Co., Ltd., Drawing Office Stationers, 39, Victoria Street, London, S.W., and 32, Paradise Street, Birmingham.

In the hands of a careful man, having some proficiency in "the mathematics," the slide-rule is an instrument of wide utility. This concise manual exhausts the calculations that it is usual to perform on the slide-rule, and puts the mathematician in a fair way to devise further applications for himself. The general principles are tersely and lucidly explained, the various ways in which the slide-rule can be advantageously employed are enumerated, and rules for finding squares and square roots, cubes and cube roots, mantissæ of logarithms, and sines, cosines, tangents, etc., are expounded, as well as the more elementary calculations to which the slide-rule can be adjusted. So simple, concise, and eminently practical a manual is sure to be widely appreciated.

A dividend at the rate of 5 per cent. per annum, free of income-tax, was declared at the 21st ordinary general meeting of the Patent Victoria Stone Company, Ltd. Mr. W. T. Douglass, M.Inst.C.E., who presided, stated that the company had naturally suffered from the prevailing depression in the building trade, but mentioned that the past two months had shown an improvement, and that the company had received very fair and substantial orders.

Notes and News.

The Society of Architects will pay an official visit to the Building Exhibition at Olympia on Friday, April 23rd, by invitation of the Executive.

* * *

A sanatorium for women is proposed by the health committee of Bradford City Council, and it is suggested that, as a preliminary measure, certain sanatoria that are of approved construction shall be visited with a view to obtaining information and guidance. The proposed sanatorium is for fifty beds.

* * *

The new elementary schools at Failsworth, which are being built under the supervision of Mr. Henry Littler, the Lancashire county architect, are now approaching completion. The concrete floors, constructional steelwork, and fireproof floors were constructed by Messrs. Homan and Rodgers, Manchester, the concrete being finished ready to receive boards nailed direct.

* * *

At a meeting of the Glasgow University Geological Society, a paper on "Building Stones, with Special Reference to their Behaviour in the Glasgow Atmosphere," was read by Mr. R. Boyle, B.Sc., who remarked that the primary test of a building stone consisted in the microscopic examination of a thin slice, and chemical analysis should only be used to elucidate the petrographical structure. A cementing material of silica is the best for the Glasgow atmosphere, and one of carbonates the worst. The presence of alumina up to about 1½ per cent. is only deleterious when in the form of ordinary clay. The Permian red sandstones of the South of Scotland withstand the Glasgow atmosphere best. In them the cementing medium is mostly iron peroxide, to which the red colour is due. Actual crushing tests collected and plotted by the writer show that the strength of a sandstone as determined from cubical specimens should be reduced about 10 per cent. Standard test specimens should have a height equal to 1½ times the least width. Flat surfaces should be avoided in buildings as far as possible. Projecting ledges, cornices, and string courses, should be given a top slope, and in the case of some stones should be initially coated with concrete, oil paint, or other preservative.

* * *

Sheffield, where the prevailing conditions are most provocative to a study of the pollution of the atmosphere by smoke, has been selected as the first provincial city in which to hold a smoke-abatement exhibition and conference, and the exhibition, which remained open for three weeks, brought together a very interesting collection of appliances for preventing smoke and of fuel guaranteed not to smoke. Sir Oliver Lodge, in opening the exhibition, said that for house heating the ideal method was a combination of open fire and pipes, open fires in the rooms and pipes in the passages. He deprecated, however, our present open coal fires. He was convinced that before long we should have gas laid on in large quantities for heating and cooking purposes, and should depend much more in the future on electricity for lighting and gas for heating and cooking. He only hoped that at an early day some town in England would try the experiment of having the gas made at the coal pit, where coal was cheap, bringing the gas to the consumer in pipes, as water and electricity were now brought, and forbidding the importation of crude coal into the town. They might supply great quantities of gas at a very cheap rate and get it used for all purposes. If one town would try the experiment and it succeeded, other towns would imitate it. He hoped to live to see that accomplished. One or two towns, he believed, were already thinking about this. The purification of the air was one of the most important factors in the improvement of the conditions of life.

Federation News.

THE NORTHERN CENTRE OF THE NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS.

Secretary: James Denver.

There is nothing to report from the Northern Centre, no meetings of the council having been held.

Arrangements have been made for the next meeting of the Council to be held in London, on Wednesday morning, April 21st, at 10.30 o'clock, and it is hoped that members of the council will avail themselves of the invitation to visit the International Building Trades Exhibition the day previous.

The Northern Centre Board of Conciliation for the Building Trade.

A special meeting of the Northern Centre Conciliation Board was held at the Liverpool Association Board-room, 24, Sir Thomas Street, Liverpool, on Wednesday afternoon, February 17th, at 2.30 o'clock.

Two appeals were before the Board:—(1) From the Birkenhead local board, with reference to a firm of Liverpool contractors working in their district and observing the Liverpool working rules; and (2) from the Liverpool Operative Masons' Society, claiming a firm of masons at Rainhill to be Liverpool employers.

The appeal from Birkenhead was taken first, and Mr. H. W. Wellings, the operatives' secretary to the local Board, stated, on behalf of the operatives, that the firm referred to had secured a contract in their district, and, although they had been approached on several occasions, they refused to adhere to the Birkenhead rules, owing to the Liverpool radius being ten miles from the landing stage, which radius covered the whole of Birkenhead and many miles beyond.

Other members spoke on behalf of the operatives, and claimed that the Liverpool boundary was never intended to extend to the Cheshire side of the Mersey. Mr. G. P. Snape, chairman of the local board, stated, on behalf of the employers, that, although he consented to a meeting of his Board being held, he felt they had no jurisdiction in the case, as he was sure the employer was quite within his rights in working to Liverpool rules, although the work was in their district. He also informed the meeting that they had observed the difficulty and trouble of the two districts overlapping, and both the Birkenhead and the Liverpool employers had given notice, prior to this dispute arising, to have the same altered.

Mr. B. B. Moss also spoke on behalf of the Liverpool employers.

After hearing the evidence of the witnesses and giving the points full consideration, the following resolution was unanimously agreed to:—"That this Board, having heard the evidence respecting the dispute in Birkenhead between a firm of Liverpool contractors and the Operative Bricklayers' Society, find they have no jurisdiction in the matter, but desire to point out to the employers and operatives, both at Birkenhead and Liverpool, the desirability of altering their rules so that there shall be no overlapping in the boundaries."

The appeal from the Liverpool operative masons was then considered, and Mr. Moss stated that the firm complained of were members at St. Helens; and though the appeal had been lodged in the first place with the Liverpool association, they felt they had no claim over the firm owing to their not being Liverpool members, and therefore the appeal had been forwarded direct to this Board. Mr. Rice, on behalf of the operatives, claimed the firm to be Liverpool employers, owing to their work being on the Liverpool side of the boundary arranged by this Board some short time ago; but the firm claimed that, as they were members at St. Helens, they were bound by the rules of that town. After hearing the evidence of the witnesses, a resolution was passed appointing two members to visit the district, and ascertain on which side of the boundary the works were situate, their decision to be the decision of the Board.—JAMES DENVER, Secretary.

LANCASHIRE, CHESHIRE, AND NORTH WALES FEDERATION OF BUILDING TRADES EMPLOYERS.

The administrative committee of the Lancashire, Cheshire, and North Wales Federation of Building Trades Employers held their monthly meeting at the Board-room, Manchester, on Friday, February 12th, at 2.30 o'clock, when the president (Mr. William Bullen) presided over a good attendance of members.

A letter was read from the president of the reorganised Accrington Association, thanking the committee for the steps they had taken in bringing the employers in that town again into line, and expressing the hope that application for affiliation to the Federation would be sent on shortly, which was considered very satisfactory.

Correspondence was read from the Heywood Association with reference to the Heywood Post Office contract, and after hearing explanations on the subject, the secretary was instructed to write to the Heywood Association thereon.

The draft of a proposed fair wages clause, as sent down by the National secretary, was carefully considered, and approved.

The rules of the Lancaster Association were recommended for adoption, subject to one or two slight amendments.

A circular letter from the National Federation *re* the National form of contract was considered, and it was decided to forward a copy of the same to the local associations, and invite their views thereon.

A recommendation from the Conference of Secretaries, held on January 22nd, was before the meeting, requesting that they be allowed to hold half-yearly conferences in future, which was unanimously agreed to.

A case was reported from the Bolton Association, where one of their members had signed a form of contract agreeing to the architect being the sole arbitrator, with the result that the architect had refused to allow for extras to a considerable amount. After considering the case at some length, it was agreed to assist the Bolton Association in the matter by appointing a sub-committee to investigate the case if required to do so.

The quarterly meeting of the Plasterers' Trade Committee of this Federation was held at the New Boar's Head Hotel, Bury, on Wednesday, February 24th, when Mr. J. B. Johnson, Liverpool, presided over an attendance of 17 representatives from the various federated towns.

Several matters of trade interest were considered, including the fixing and finishing of plaster partitions, the election as a chairman of a member of the Administrative Committee, the use of patent materials, the N.A.O.P. agreement, etc., etc.

A case was reported from Manchester, where the Operative Plasterers' Society had laid against an employer certain charges, which, on investigation, were considered to be unfounded The case was dealt with at considerable length, and ultimately it was agreed that, as the matter was of such importance to the trade, the Manchester Association be requested to furnish this committee with a full report of the case at a later date.

A well-written paper was read by Mr. James Cadman, of Swinton, Manchester, entitled "Our Federation: Its Aims and Ideals." Mr. Cadman dealt principally with the present state of the trade—unremunerative prices, unfair competition, and the benefits to be derived from membership of the Federation. A vote of thanks was afterwards passed to Mr. Cadman for the trouble he had taken in preparing and reading his paper.

It was decided to hold the next quarterly meeting at Southport.

The representatives were afterwards entertained to tea by Mr. John Hamer, master plasterer, of Bury, to whom a hearty vote of thanks was accorded for his hospitality.

Messrs. Hall and Pickles, iron and steel merchants, 64, Port Street, Manchester, with branches in Birmingham, Newcastle, and Swansea, have issued an elegant leather-bound pocket list of metal joists, beams, channels, girders, plates, etc., giving particulars that will be of great assistance to builders and architects in measuring up quantities.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must contorm to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

March 25. HOMERTON, E.—Erection of two house coal stores at the Eastern Fever Hospital, Homerton Grove, Homerton, E., for the Metropolitan Asylums Board. Particulars at the office of the board, Embankment, E.C., upon deposit of £1. Tenders by 10 a.m. on March 25, at the office of the Board.

March 31. BURSLEM.—Making-up Parker Street, for the corporation. Plan and specification, etc., on deposit of £2 2s., with F. Bettany, borough engineer and surveyor. Tenders, to A. Ellis, town clerk, town hall, Burslem, by 5 p.m. on March 31.

March 31. NORMANTON.—Supplying stone and concrete flags, kerbs, channels, setts, granite, limestone, whinstone, and tar macadam, for the U.D.C., for 12 months commencing April 1. Tenders by 5 p.m., on March 31, to John W. Martin, clerk, council offices, Normanton, of whom particulars are to be obtained.

March 31. HUNTINGDON.—Supplying broken granite and iron slag, for the year ending March 31, 1910. Particulars on application to Herbert Leete, county surveyor, High Street, Huntingdon, to whom tenders are to be sent by 10 a.m. on March 31.

April 1. LONDON.—Supplying the following road materials, for the commissioners of H.M. Works and Public Buildings:—Guernsey or Alderney granite, flints, red pit sand, gravel, cockle shells, screened Thames sand, and ¼in. pea gravel. Forms of tenders at H.M. Office of Works, Storey's Gate, S.W. Tenders before noon on April 1, to the secretary.

April 3. STRETFORD.—Paving with setts granited rock, asphalt, etc., six streets and passages, for the U.D.C. Particulars of Ernest Worrall, the council's surveyor, on deposit of £2 2s. (cheque). Tenders to the chairman of highways, council offices, Old Trafford, by April 3.

April 3. WATH-UPON-DEARNE.—Supplying and delivering during year ending March 31, 1910, for the U.D.C.:—1, granite and Whinstone macadam; 2, machine-broken furnace slag; 3, tarred slag; 4, limestone screenings; 5, slag screenings. Particulars of H. C. Poole, surveyor, town hall, Wath-on-Dearne, to whom tenders are to be sent by April 3.

April 3. DUNMOW.—Supplying 1,025 tons broken granite, 1½in. gauge, to be delivered free, during May, June, and July, for the R.D.C. 670 tons at Dunmow and Takeley railway stations, 300 tons at Felstead railway station, 50 tons at Elsenham railway station. Tenders, with samples, by March 3, to Alfred E. Floyd, clerk, Dunmow, Essex.

April 3. MIDDLETON.—Supplying setts, flags, sanitary tubes, granite, macadam, cast-iron manholes and street grids, waste water closets, and lime, during the year ending March 31, 1910, for the Corporation. Particulars of W. Welburn, borough surveyor, town hall, Middleton. Tenders, addressed to the chairman of the surveyor's committee, by April 3, to Frederick Entwistle, town clerk, town hall, Middleton.

April 6. MALDON.—Supply and delivery of:— 1, granite; 2, slag; 3, Kentish flints; 4, picked stones; 5, gravel; for the R.D.C. Particulars of E. J. Ennals, surveyor, 6, Market Hill, Maldon, Essex, where tenders must be delivered by April 6.

April 6. CROWMARSH.—Supply of broken granite, flints, and gravel, for repair of highways for year ending March 31, 1910; also cartage and hire of steam roller, with plant, at per day, for the R.D.C. Particulars from Jos. Preston, surveyor to the council, Benson, Wallingford. Tenders by April 6, to G. F. Slade (solicitor), clerk, 7, St. Martin's Street, Wallingford, Berks.

April 10. BURY ST. EDMUNDS.—Supplying granite during year ending March 31, 1910, for the West Suffolk C.C. Tenders by April 10, to A. Ainsworth Hunt, county surveyor, Shire Hall, Bury St. Edmund's.

MISCELLANEOUS.

March 27. LANCASTER.—Replanking and providing iron standards, etc., at Keer Bridge, in Warton and Carnforth, for the R.D.C. Particulars on application to W. Dixon, surveyor, 5, Dalton Square, Lancaster. Tenders by 10 a.m. on March 27, to William D. Ball, clerk to the council, 5, Dalton Square, Lancaster.

March 29. PORTSMOUTH.—Altering doors and frames in the town hall and supplying and fixing panic bolts, for the Corporation. Particulars at the borough engineer's office at the town hall. Tenders by 10 a.m. on March 29 to Alexander Hellard, town clerk, town hall, Portsmouth; fair wages clause.

March 29. EDINBURGH.—Supplying the following material for the electricity supply department for the year from May 16:—Bitumen, lead-covered paper insulated copper cables, arc lamp carbons, arc lamp globes, house service fuse boxes, electricity meters, cast-iron pipes and pavement boxes. Particulars at the engineer's office, Dewar Place, Edinburgh, on deposit of 10s. Tenders by March 29, to the town clerk, City Chambers, Edinburgh.

THE

Federated Employers' Insurance Association, Ltd.

HEAD OFFICES:
8, King Street, MANCHESTER.

Non-Tariff—Founded by Builders.

THIS ASSOCIATION GUARANTEES THE DUE PERFORMANCE OF CONTRACTS and invites enquiries from Contractors in matters incident thereto. Negotiations tend to prompt and effective arrangements.

BUILDERS' RISKS so far as WORKMEN'S COMPENSATION AND PUBLIC LIABILITY are concerned form special features in connection with the Association's operations. Moderate Rates and equitable conditions apply.

FIRE, PERSONAL ACCIDENT AND ILLNESS, and miscellaneous Insurances are transacted.

Submit enquiries.

Federation Secretaries are invited to apply for an Agency.

GEO. L. DREW,
General Manager and Secretary.

Telephone: 5948 Manchester
Telegraph: "Federated, Manche

Appointments Wanted.

The charge for Advertisements under this heading 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ABLE architect prepares designs, perspectives, working drawings, etc., on moderate terms.—W., 6, King's Road, Kingston-on-Thames. 4918

ADVERTISER (28), seeks re-engagement, ten years' thorough practical knowledge of building, estate management, and repairs, etc.; experienced in preparing plans and estimates, including quantities, for new works; highest refs. — Y., 86, Coniston Road, Muswell Hill, N. 4805

APPOINTMENT as Improver (19), prob. R.I.B.A., just completing three years' articles with an architect and surveyor; small salary to commence; highly recommended.—H. Cullerne, "Bridge House," Lugwardine, Hereford. 4911

ARCHITECT and Surveyor's Assistant, P.A.S.I. (22), working drawings, surveying and levelling, taking off, abstracting and billing quantities, drainage and sanitation; general office routine.—George A. Taylor, Aston Road, Wem, Salop. 4892

ARCHITECT'S Assistant desires engagement, finalist R.I.B.A.; design, details, specifications, 1st class honours, quantity surveying, honours (Part 1), building construction, artistic and practical; moderate salary.—Address Architect, 24, Brunswick Street, C.-on-M., Manchester. 4871

ARCHITECTURAL Draughtsman, thoroughly experienced in designing steel and ferro-concrete work, factory chimneys, retaining walls, foundations, overhead gantries, and all constructional work is open to assist or consult architects by correspondence.—Box 4827, Builders' Journal Office

ARCHITECT and Surveyor's Assistant (25), 9 years' experience; excellent draughtsman, working drawings, details, specifications, perspectives, surveying, French, typewriting; moderate salary.—Arthur Bailey, 26, North Street, Hailsham, Sussex. 4819

ARCHITECTS, Builders, etc., draughtsman (19), used to general work, fill up time in office; good references.—F. J. Williams, c/o F. Cundall, Architect and Surveyor, 34, Parade, Leamington Spa. 4878

ARCHITECT'S Assistant (22), six years' experience; student R.I.B.A., good draughtsman, contract drawings, details, surveying, etc.; assist with quantities; salary moderate.—J. J. S., 1, Silver Street, Stockton-on-Tees. 4888

ARCHITECT'S Assistant (27), excellent draughtsman and colourist; contract drawings, specifications, details, design, perspective, surveys, etc.; travelling studentship winner; highest refs.—Box 4902, Builders' Journal Office.

ARCHITECT'S Assistant (23) desires engagement, town or country; excellent draughtsman; good general experience; first-class references.—Box 4937, Builders' Journal Office.

ARCHITECT and Surveyor's Assistant (21), seeks re-engagement; 5 years' experience in church and domestic work in larger provincial office; good draughtsman and colourist.—Box 4823, Builders' Journal Office.

ARCHITECT and Surveyor's junior assistant (19), desires engagement; surveying, levelling, etc.; office routine; salary 15s.—Box 4930, Builders' Journal Office.

ARCHITECT'S Assistant (25), R.I.B.A. exam., nine years' thorough practical experience, design, working drawings, details, specifications, estimating, quantities, levelling, perspectives, etc.; sal. moderate.—Apply, Box 4900, Builders' Journal Office.

ARCHITECT'S fully qualified Assistant and Quantity Surveyor, energetic and experienced, desires immediate engagement, temporary or otherwise; competition expert; highest references; salary moderate.—W. B., 156, Warwick Road, Birmingham. 4935

ARCHITECT'S Junior Assistant disengaged, 4½ years' articles, wishes to meet with architect in Lancashire office; specimen drawings, certificates for construction; sitting for Inter. R.I.B.A., June.—Apply, J. S. H., Wittington Lane, New Springs, Wigan. 4815

ASSISTANT A.R.I.B.A. (29), 14 years' London and Provincial experience; working drawings, details, specifications, supervision, perspectives, assist quantities, well up in management; testimonials; references; salary, 2 guineas.—Apply A, 31, Cotswold Road, Westcliff-on-Sea, Essex. 4775

ARCHITECT'S Junior Assistant, 5½ years' experience; disengaged; working and detail drawings, typewriting, knowledge of perspective; moderate salary.—W. L. Francis, 11, Middleton Road, Ilkley, Yorks. 4891

ARCHITECTS, and builders, experienced surveyor open to prepare quantities and estimates, check accounts and measuring; moderate terms.—Apply Box 4817, Builders' Journal Office.

ASSISTANT Surveyor seeks re-engagement; 9 years with City firm; highest testimonials; surveys, levels, estate management, etc.; shorthand if required; moderate salary.—K., 21, First Avenue, Manor Park. 4917

ASSISTANT, provincial experience, good planner and designer, domestic Renaissance, working drawings, details, surveying, competitions; excellent draughtsman, A.R.I.B.A. at one sitting; age 27.—Box No. 4928, Builders' Journal Office.

BUILDERS' Assistant desires situation; thorough knowledge plans, specifications, quantities, measuring; not afraid of work; salary not so much an object as permanent situation; 21; 5 years' experience.—Box 4839, Builders' Journal Office.

BUILDER and contractor's estimating and managing clerk seeks berth, exceptionally good all-round qualifications, acquired by sound London and provincial experience, and a reliable and successful estimator, including sewerage and kindred works; good references.—T. C., 3, Hampton Terrace, Brighton. 4933

BUILDER'S or Architect's Junior Assistant (18), good tracer, well up in prime cost, and general office work; excellent references; three years' experience. — J. W., 164, Wellesley Road, Ilford, Essex. 4833

BUILDER'S Clerk and Assistant (20) requires situation; good draughtsman and colourist, certificates advanced construction, bookkeeping, typewriting and general routine; excellent references. —C. E., 59, Rosebery Gardens, Harringay, N. 4904

BUILDER'S clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 4883

BUILDING Exhibition.—Young architect is prepared to assist exhibitors at the above; can reach same daily; terms low.—Box 4925, Builders' Journal Office.

BUILDING Trades' Exhibition, 1909.—Gentleman, with wide architectural experience, offers services to provincial or other exhibitors as representative at their stand; for terms apply Box 4931, Builders' Journal Office.

CARPENTER and Joiner desires sit.; bench, building or estate, or other suitable capacity; experienced; good refs.; age 30.—R. H. W., 24, Thorncroft Road, Fratton, Portsmouth. 4908

CLERK of Works, desires re-engagement, possessing first-class testimonials for ferro-concrete construction, also from Metropolitan Borough Councils, eminent architects and engineers; age 45.—Box 4922, Builders' Journal Office.

DRAUGHTSMAN (junior), 5 years' experience in structural engineers, good knowledge of constructional and ornamental work, details, quantities and estimating; shop experience.—M.D., 74, Bartholomew Road, London, N.W. 4884

DRAUGHTSMAN, neat, quick tracer, working drawings from rough sketches, good colourist; shorthand, typing, etc.; about 12 years' varied experience; terms moderate.—Box No. 4889, Builders' Journal Office.

ESTATE Owners.—Bricklayer, all-round, stonewaller, and general repairs; abstainer; good references; moderate wage for permanency.—Quinton, 12, Holland Road, Aston, Birmingham. 4802

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, Builders' Journal Office.

FIRST Class Architectural Designer and Draughtsman, artistic and practical, experienced in planning; elevations and details, office and competition work; moderate salary.—Apply Box 4792, Builders' Journal Office.

FOREMAN Painter (working) seeks re-engagement); experienced in all class work in building trade, as for general alterations, etc.; good supervisor, and reliable; either town or country; abstainer.—X. Y. Z., 8, Barton Street, Westminster. 4807

GENTLEMAN, with office in Glasgow, splendid connection among architects, builders, etc., is open to represent one or two good firms; first-class references given.—Box 4893, Builders' Journal Office.

GENERAL Foreman seeks re-engagement; alterations or new, practical experience in all branches; carpenter and joiner; good references; age 36; moderate wages.—Caplen, 3, Victoria Mansion, Edgware Road, Paddington, W. 4779

GENERAL Foreman seeks re-engagement, thoroughly practical and reliable; new or alterations; carpenter and joiner; life abstainer; first-class references.—Foreman, 3, Hawbridge Road, Leytonstone. 4787

GENERAL or builder's foreman, energetic, reliable, good timekeeper, trade bricklayer; age 32. Good refs.—G. C., 44, Richmond Park Road, Kingston-on-Thames. 4863

JUNIOR Assistant desires situation, home or abroad; good practical knowledge of construction and details; competent draughtsman and colourist, working drawings, measuring and supervising, surveying and levelling; moderate salary.—Box 4613, Builders' Journal Office.

MACHINIST seeks situation; spindle fourcutter, etc.; married, age 32; total abstainer and good timekeeper.—Machinist, 46, Priory Street, Tonbridge, Kent. 4874

PAINTING, paperhanging, distempering, graining wanted, piecework, new work at greatly reduced prices; specimen showing architects' and surveyors' testimonials for quality and cheapness.—Galton, 6, Parolles Road, Upper Holloway, N. 4861

PLASTERER, good jobbing bricklayer, roofs, fire work, stoves, tiling, etc., etc., generally useful, good reference, moderate wages, non-union.—A. Trigg, 117, St. John's Hill, Clapham Junction, S.W. 4856

REINFORCED CONCRETE.—Details, drawings, calculations, and assistance generally, rendered to architects, builders, etc., by a specialist of large experience; terms moderate.—Box 4887, Builders' Journal Office.

SURVEYOR'S Assistant seeks re-engagement, 9 years with City firm; highest references; surveys; levels, estate management, etc.; shorthand and typewriting, if necessary. — J. P. K., 21, First Avenue, Manor Park, Essex. 4873

TO Estate Owners, builder, experience, in all trades, desires position as manager (working or otherwise); plans prepared, quantities, setting out, accounts and supervision; abstainer; country preferred.—Box 4806, Builders' Journal Office.

WORKING shop foreman seeks re-engagement, thoroughly practical and reliable carpenter and joiner; abstainer; 7 years' ref.; age 38; wages moderate.—C. M., 16, Margett's Road, Kempston, Bedford. 4932

WORKING Foreman wants job, capable, energetic, thoroughly understands plans and setting out of buildings, etc., and taking full control of all branches; twenty years' experience; age 35; just finished job; trade, carpenter and joiner; not afraid of work; wages required, £3 per week. —Apply Box 4906, Builders' Journal Office.

YOUNG Architect is prepared to assist others, at his own office or otherwise; mod. terms.—Box 4926, Builders' Journal Office.

Appointments Vacant.

ARCHITECTURAL Editor, with wide experience in general building construction and literary style, required to take up editing of architectural textbooks before same are sent to press.—Apply by letter, giving full particulars of qualifications and salary required, to "R." c/o Paul E. Derrick, 34, Norfolk Street, Strand. 4929

ARTICLED Pupil—Reinforced Concrete. Required a young gentleman as articled pupil in reinforced concrete specialist's office, one with a knowledge of elementary applied mechanics, and mathematics and a taste for theory of construction and design preferred; an excellent opportunity for one willing to learn and understudy chief engineer.—Write, R. C., c/o Hastings Bros., Ltd., King's Chambers, Portugal Street, Kingsway, W.C. 4907

ARTICLED PUPIL.—Vacancy for same in old established West End firm of architects and surveyors; moderate premium; small progressive salary to suitable youth.—Box No. 4890, Builders' Journal Office.

ESTATE clerk of works wanted, used to building and general estate work; highest references required; state wages.—Apply, Clare, Estate Office, Rothley, Leicestershire. 4924

MESSRS. Oliver and Dodgshun beg to thank the various applicants in response to their advertisement of 10th inst., and to say that the vacancy has been filled.

WANTED, Joiners' Foreman, for London shop of 20 men; able to estimate and work accurately to cost; used to machinery.—Box 4936, Builders' Journal Office.

March 31, 1909. Volume 29. No. 738.

The Beauties of Bath. Mr. Ernest George, Mr. T. G. Jackson, and Mr. Mervyn Macartney, have joined in the protest against the proposal to demolish a portion of Bath Street, Bath, in order to make room for a modern hotel. These gentlemen are anxious to preserve a spot which, as Mr. George says, "has historic associations and is pleasant of aspect. . . Bath Street is part of a scheme laid out with design and dignity in Georgian days, including the Baths and the Pump-room, with their colonnaded spaces and approaches. We have few such examples of studied architectural treatment in our cities." He adds that, "It is sad if, in this twentieth century, our ideals do not lead us to anything higher than the destruction of that which was thoughtfully and admirably done by our forefathers." Prebendary Boyd, the Rector of Bath, is energetically opposing the scheme, as he too is anxious to prevent the unnecessary destruction of a characteristic example of the Georgian architecture of Bath; and he supports his case with the very just claim that, besides Bath, there are but few places that can show one prevailing architecture of merit, and that therefore "it would be a thousand pities for a portion of it to be destroyed." On the other hand, a local architect protests against the protesters, and deprecates their efforts to "preserve in its present dilapidated and jerry-built entirety the so-called antiquarian, historical, and architectural gem." One of the curiosities of the controversy is a letter from a correspondent who opposes the demolition on purely utilitarian grounds. "Scientists have proved beyond a doubt," he writes, "that the bacilli of virulent diseases remain practically for ever in the masonry of buildings, and that it is very injurious to the community at large to disturb such. It is with no alarmist motives that I urge the advisability of letting sleeping dogs lie, especially when they are bacilli, but—." This gentleman's argument need not be pressed to its remorseless conclusion. A general recognition of "the advisability of letting sleeping dogs lie, especially when they are bacilli," would rob the Society for the Preservation of Ancient Buildings of its right of being, and the "housebreaker" of his devastating occupation. But, seriously, much as we are inclined to distrust the outcry of "Vandalism" that is certain to arise upon the slightest pretext, we are in this instance disposed to sympathise — not with the canine bacilli non-alarmist, nor with the sentimentalists who attach great weight to the detail that Jane Austen made one of her characters buy ribbons in Bath Street, but—with the architectonic point of view adopted by the President of the R.I.B.A. The work destined to destruction may possibly in itself be invested with but little of interest or of beauty; but it happens to form an integral part of a general scheme, which, we gather, would be rendered lamentably imperfect by the obliteration of one of its characteristic features. This seems to us to be a reasonable ground for protest.

An English Chair of Civic Design. Town-planning may very conceivably become the most important movement in the history of architecture, and Liverpool is to be congratulated on its good fortune in being placed in a pioneer position. As we stated in our issue of December 9th, 1908, Mr. W. H. Lever, M.P., made to the University of Liverpool a characteristically generous offer. He undertook to provide annually, for three years, a sum of not less than £500, and, subject to the needs of the case, of not more than £1,000, to be expended on instruction and research as to methods in town planning and architectural landscape, as well as a capital sum of £500 to be devoted to research. The offer was, of course, gladly accepted. The administration of this trust will be watched with keen interest. It was suggested that, at the outset, a large proportion of the available income might be judiciously spent in organising a commission of investigation, which would visit and examine those places at home and abroad whose essays in town-planning are worth studying, and would afterwards issue reports embodying the experience thus obtained. This part of the scheme is yet to mature. In the meantime, the University of Liverpool, thanks to Mr. Lever's beneficence and enthusiasm, has established the first English Chair of Civic Design and Landscape Architecture, and it is announced that the Council of the University, at a meeting held on March 23rd, appointed Mr. Stanley Davenport Adshead, F.R.I.B.A., as Associate Professor of Civic Design. The School of Architecture was founded in 1881 by the citizens of Liverpool to commemorate the name of William Roscoe, and the Roscoe Professor of Architecture, Mr. Charles H. Reilly, M.A., A.R.I.B.A., will have in Mr. Adshead a coadjutor who, besides being a close student of town planning, is an extremely accomplished draughtsman. Altogether, Liverpool may well be envied its extraordinary opportunities of taking and keeping the lead in the orderly and systematic study of the principles and practice relating to what is likely to be the most momentous practical development that the profession has yet seen. This is a tangible beginning to great issues; and like the immortal dreamer of Elstow, we "wonder whereto this thing may grow."

Lovely in Their Lives. By a rather remarkable coincidence, three recent lectures before architectural societies have been mainly biographical. Mr. James Williams, in his lecture to the Architectural Association—an abstract was printed in last week's issue—gave a sympathetic account of the life and work of George Devey, whose sterling character and rare personal charm were perhaps of more striking interest than his work executed at a time that was unpropitious for the artistic side of architecture, but nevertheless better than that of the average "Early Victorian." Mr. A. Herbert has offered to the Leicester and Leicestershire Society of Architects an appreciation of the drawings and executed works of F. W. Ordish (born 1821, died 1885), who was president of that Society from 1876 to 1878, was associated with Pugin, had an unusual diversity of gifts, and was a particularly brilliant draughtsman. Then, thirdly, Mr. Butler Wilson described to students of the Leeds School of Art the career of Cuthbert Brodrick, the architect of the Leeds Town Hall, which he designed at the age of twenty-nine, and which was destined to be his most notable achievement. Mr. Butler Wilson claims that this building—Roman Renaissance of the Corinthian Order—remains almost unsurpassed, both in size and treatment, as a provincial hall; it has an area of 869,000 cubic feet, as compared with the 504,000 cubic feet in the Guildhall of London. Brodrick's fame spread to London, and he was one of the six British architects selected by the Government to submit designs in competition for the enlargement or entire re-building of the National Gallery. He designed also several public buildings in Leeds, including the Corn Exchange. Another of his works is the Hull Town Hall. He was commissioned to design a new Custom-house for Bombay, which was to cost £270,000, but the project was abandoned, Brodrick receiving, however, £3,000 for his drawings. Brodrick lived and practised for a time in Paris, and was within the French lines during the stirring times of the siege and Commune. He died at St. Martin's, Jersey, on March 2nd, 1905 —not in poverty, as was declared in a mendacious rumour, which saw his grey hairs brought down in sorrow to the position of a shoeblack!—but in such comfort as a balance of £11,000 at one's bankers may be held to imply. We must confess to a liking for these occasional excursions into the delightful domain of biography; for, while they must necessarily be "mainly about people," they imply a good deal of professional interest, conveyed in a particularly agreeable manner; and matter in this palatable form is perhaps more certain of assimilation than that which is administered with more didactic method and intention.

The Brutal Truth about Art.

The painter of pictures must reconsider his position. It is some considerable time since he made the painful discovery of a growing indisposition to purchase his products. He is now being told that if he had been less unworldly he would have discovered for himself the reasons for the decline. He has been informed, in the leading columns of the "Times," that the facile representation of the beauties of Nature which can be more satisfactorily realised "by looking out of windows" has become superfluous in consequence of the growth of modern taste, and that the easel picture is at best but dubiously decorative. The painter was therefore advised to adapt his skill to the changed conditions—to become a decorator. "Truth" states the case still more bluntly: "The painter of to-day must come off his perch. It is mere folly to sit in a corner sulking or bewailing his fate because people no longer live in rooms with hideous wallpapers which require covering with worse paintings. Let him fall into the general scheme of things and regard himself humbly as a house decorator." It is doubtless the fact that, as our contemporary contends, "The revival of domestic architecture, which includes interior decoration after the fashion of the seventeenth or eighteenth centuries, when no one dreamed of using pictures as the sole means of adorning the walls of a room," is responsible for the change. Architecture, having resumed her position as "the Mistress Art," is re-asserting herself, and is becoming as imperative as she was wont to be in the days when the decoration of churches, palaces, and public buildings produced some of the finest paintings that the world has seen. Nor is there any lack of modern examples. The decorations at the Royal Exchange, and still more strikingly, Mr. Abbey's panels for the Boston (U.S.A.) Public Library, show how the painter may dignify rather than degrade his art by making it decorative and subordinate.

THE A.A. PLAY.

The A.A. play on "The Rise and Fall of Architecture" was presented, with all possible success, on Wednesday (ladies' night), and Friday (smoker) of last week, at The King's Theatre, Covent Garden. In our next issue we hope to give further particulars and some sketches. Meanwhile, we desire to congratulate all concerned upon their excellent work. The A.A. Musical Society provided the orchestra, under the bâton of the composer, Mr. C. A. Kelly.

A LESSON FROM THE PAST.

Abstract of part of a paper read by Mr. J. A. Marshall before the Architectural Association on March 19th.

The first part of Mr. Marshall's paper consisted of a somewhat satirical retrospective review, after the method of "Looking Backward," of the architectural (and engineering) practice of the period described as "The beginning of the Twentieth Century of our era," when "Science, that most progressive department of man's activity, was in direct conflict with art, as that term had long been understood; like the canker in the rose, its insidious encroachments could not be suppressed; new systems of construction—not amenable to any style of the past—had arisen almost without warning, and the older methods were becoming as obsolete as the sedan chair of Queen Anne or the 'Fighting Téméraire' of Trafalgar." In the second part of his paper, Mr. Marshall said:—

Phases of Historical Architecture.

It is well stated in your curriculum that "the growth and development of the various phases of historical architecture have arisen mainly through constructional and actual necessities, modified by varying social conditions and the material available."

In following this development you will find that, though historical architecture has its phases of incipiency, maturity, and decadence, yet throughout the ages there was a distinct and uninterrupted advance in the science of building, an advance that was as little affected or impeded by ornamental art as is the tidal ocean by the undulations on its surface; and your attention cannot fail to be arrested by those brilliant achievements in constructive skill that stand conspicuous and unapproachable amid the ever-widening stream of architectural activity.

A Sudden Expansion.

Thus, in the fifth century, when the religious zeal of the Emperor Justinian urged him to build the finest church in the world, the result was a sudden expansion—almost to the bursting point—of the crude principles of pendentive vaulting. In the twelfth century the constructive expedients resorted to by our own Wren were dimly yet surely foreshadowed in the Baptistry at Pisa. In the fifteenth century the citizens of Florence, in their religious pride, surmounted their cathedral and the whole city with the largest dome in the world, built on a principle for which there was absolutely no precedent beyond the obscure crudity of the Roman Pantheon. A century later the Roman pontiffs aimed at something still more daring, and at St. Peter's the massiveness of the Florentime dome is sustained by the buoyancy of the Byzantine. And finally, in the seventeenth century, Sir Christopher Wren, for the citizens of London, produced the greatest artistic effects by a novel and skilful disposition of the slenderest materials.

If you turn to

The Gothic Period

you will find the continuity of the advance perhaps still more marked. During the early stages the statical conditions are abundantly maintained in the sturdy proportions of the design. Later, this timidity gives place to a more economic adjustment of the various parts on a grander scale, until all redundant material is eliminated, and the structure may be said to present a diagrammatic illustration in stone of the strains and stresses. Finally, this open sincerity is succeeded by an artificial display of the mason's craft, as ingenious as it is splendid.

Instances of these phases are well known to you. The historian and the archæologist have very kindly traced for us their evolution. Due chiefly to varying social conditions, the mutation was generally a matter of slow time, and there was nothing startling about it; but when a great calamity occurred —like the plague of the fourteenth century, which swept away more than one-half of the four millions who then formed the population of England—the thread of tradition was somewhat weakened, and the succeeding outburst of the mason's skill at Gloucester may, we are told, be regarded as something remarkable. The gossamer-like veiling that was then spread over the venerable features of the Norman choir, and projected right through the apse, compels our admiration, and the audacious interference is condoned in view of the independent expression it ultimately assumed in the Lady Chapel beyond, and later in the chapels at Windsor, Cambridge, and Westminster.

The Decline of Organic Architecture.

The decline of what has been termed "organic" architecture was attended by the development of a style of which a great deal is seen and heard at the present time. Precise and scholarly, with a close affinity to the articulation of antique art, it is devoid of virility, and rises superior to "constructional and actual necessities." With such attributes, and with details that can readily be expressed on paper, when they are not tortured into some wild freak, it is well within the capabilities of the modern practitioner and the modern workman; therefore it is not surprising that the beguiling influence of its later phases should now be almost universal.

Between Truth and Falsehood.

The German poet Goethe, whose mind, as you know, was pre-eminently receptive and discriminative, visited Vicenza 120 years ago. He there saw the finest buildings by the last great master of the Italian Renaissance. Of these he says:—"When once one stands in the presence of these works one immediately perceives their great value, for they are calculated to fill the eye with their actual greatness and massiveness, and to satisfy the mind by the beautiful harmony of their dimensions. Therefore I say of Palladio, he was a man really and intrinsically great, whose greatness was outwardly manifested. The chief difficulty with which this man—like all modern architects—had to struggle was the suitable application of the orders of columns to buildings for domestic or public use, for there is always a contradiction in the combination of columns and walls." (An old-fashioned objection that we hear nothing of nowadays.) "But with what success," Goethe proceeds, "has he not worked them up together! What an imposing effect has the aspect of his edifices; at the sight of them one almost forgets that he is attempting to reconcile us to a violation of the rules of his art. There is, indeed, something divine about his designs, which may be exactly compared to the creations of the great poet, who, out of truth and falsehood, elaborates something between both, and charms us with its borrowed existence." Again he says:—"The noble buildings which Palladio has erected are disfigured by the mean necessities of the people. The plans of most of them exceeded the means of those who undertook them, and these precious monuments of one lofty mind are but little adapted to all else around." At once a eulogy and condemnation.

The architect, you see, has now become a great personality. He builds for fame. The structure is his monument, the necessities of the people are ignored, and the Gothic town hall at Vicenza is henceforth buried in Palladio's "imposing" arcades.

"A Mathematician Named Wren."

About 100 years later a mathematician and astronomer named Christopher Wren was entrusted with the important task of rebuilding a great part of the City of London, after the fire that succeeded a calamity like that I have referred to of the fourteenth century.

It is not my purpose this evening to enlarge on the career of this great man, whose works are so well known to you, but merely to remind you of the fact that throughout his extensive practice he accepted the prevailing fashion of his day, and by a scientific adjustment of slender materials produced artistic

THE ARCHITECTURAL ASSOCIATION AT WORK. SKETCHES BY OUR SPECIAL ARTIST AT THE READING OF MR. JOHN A. MARSHALL'S PAPER.

effects, stamped with individuality, yet charmingly varied to suit the exigencies of the site and the purposes of the building.

Wren's work presents a happy combination of that "truth and falsehood" so much appreciated by the German poet; but, partly owing to the fact that the English architect had seldom the leisure or the means to elaborate his designs beyond their natural development, it is the "truth" that is predominant. The germs of decadence—inseparable from a renascent style—are present, but the high-water mark of constructive skill had been reached, in combination with a definite and artistic expression.

Karnak to Westminster.

Thus, throughout the ages, say from the hall at Karnak to that at Westminster, and onwards to the eighteenth century, capacity to produce really interesting work, and an absence of that aptitude—so prevalent in the present day—to produce anything uninteresting seem to have been universal.

In this connexion it should be remembered that not only were the social conditions simpler than they are to-day, but the amount of architectural building was comparatively small; the materials used were the natural products of the country; the style of building was universal, and so was the system of workmanship.

The world has turned round many times since then, and to-day constructive skill has o'erreached the legitimate capabilities of honest material. We are invited to leave the path of architectural rectitude for the labyrinthic deceits of the persuasive engineer, and the intimacy between the two professions is now so cordial that one is apt to identify the Royal Institute of British Architects in Conduit Street with the Institute of Civil Engineers in Great George Street; indeed, the amalgamation is becoming more firmly consolidated, or cemented, every day, and we must, I suppose, regard it as the inevitable sequence to that steady advance in scientific construction that I have ventured to draw your attention to this evening. Is it not, I would ask, the result of those "actual necessities" that have arisen from ultra-commercialism and over-crowding? And so long as these remain the dominant features of our social conditions, the investigation of the engineer's anatomy will be retained as a subject on the pages of your curriculum.

No doubt this is very

Flattering to the Engineer.

He has nothing to lose by the interest you take in his work. His susceptibilities and instincts of form and beauty are not likely to be weakened or destroyed by the coalition. But what of yours? A gasometer may be more expansive, but is it more impressive than the Roman Pantheon? The Tower Bridge may be "a joy for ever," but is it really more beautiful than Waterloo Bridge?

Can any combination of engineering and pseudo-architecture rival the transparent candour of the Crystal Palace?

The works of Palladio and his compeers are indeed "divine," when compared with those parodic efforts, exalted to the skies, at the corners of our streets.

Utilitarian Rome.

You have been reminded of the utilitarian principles adopted by the builders of ancient Rome; how they threw aside the stone lintel and the wooden beam, to make use of their natural cement for concrete vaults, that covered the space, without thrust, like a metallic lid. Well, we have improved on the Romans in the manufacture of metallic lids and iron grids, but whether these are destined to survive the decay of our civilisation is a question that need not concern us; it is of greater importance to know that utilitarian architecture is not necessarily opposed to art.

The evidence of Roman greatness, as reflected in its architecture, is not to be sought for in the borrowed styles of Etruria or Greece, but in the native style of Imperial days, "when beauty was in a great measure incidental, and not specially aimed at by the designer." This spirit led naturally and easily to the development of a style which, at least, had that beauty which fitness is supposed to bring with it. The motto of the Roman architect was merely, "Build in truth."

No question arose in his mind as to whether "agreement in the principles of architectural design was possible," or whether "the system of architectural education was ideal." These were settled for him by the principles of authority and continuity. By the principle of authority we mean that recognised standard which enabled the profession as a whole to agree about the truth; and by the principle of continuity we mean the tradition by which this standard was carried on, and modified or expanded to suit the wants of the time.

Modern Complexity.

It is evident, after the lapse of hundreds of years, and after many attempts, we cannot successfully resume the thread of tradition; and even the principle of authority—according to our definition—seems beyond reach, in view of the complexities of modern requirements, and the duplicity that permeates our methods. What the future has in store it is impossible to say, and it is well we do not know. But if growth is the law of art, as of every kind of life, then undoubtedly there will come a time when architecture will be entirely free from those archæological entanglements that now retard its progress. As the Romans threw aside the lintel, so are we throwing aside the arch and time alone can show whether, like our great progenitors, we shall be able to evolve an unaffected yet expressive style of architecture. But if ever again there is to be a prevailing style—assuming this to be desirable—there must, of course, be a general compliance to established methods and rules. In the meantime the efforts of those whose ideal is a universal system of training for the architect in this country should be acknowledged with gratitude by all who desire the advancement of architecture. What that system should include and what it should reject are questions that could not have arisen a century or two ago; now they are both wide and deep, and cannot properly be discussed here. May I, therefore, hasten to remind you that your first duty as students of this association is unquestionable submission to the course of study laid down for you by your advisers?

You need not fear that

Obedience to Rules

and methods will check the artistic impulse or the latent genius, any more than it did in the past. Salutary restraint in art is not opposed to originality. As Ruskin has said, "A man who has the gift will take up any style going, that is the style of his day, and will work in that, and be great in that, and make everything that he does in it look as fresh as if every thought of it had just come down from heaven." When Ruskin wrote modern architecture was—to him—in a hopeless condition, and he was oppressed by the futility of preaching a doctrine of celestial excellence, in view of the want of that obedience, unity, and order without which the architecture of the past would have been impossible.

Your hope to-day, then, should be that these conditions will be re-established in your profession, on a basis favourable to that art with which sublimity and beauty are peculiarly associated. These it was that ensured the transcendency of Hellenic art, the majesty of Imperial Rome, the glowing wonders of Byzantium.

Discussion.

Mr. H. Home, in proposing a vote of thanks to Mr. Marshall, observed that, as a constructional engineer and an associate member of the Institution of Great George Street, he felt like Daniel stepping into the lions' den. He had had the opportunity of examining many of the world's most famous buildings, and it had struck him that the designers of early times had seized upon almost any material from which to construct their buildings. It was worth noting that at San Vitale, at Ravenna, the upper arches were constructed entirely of wine jars; and he believed all would admit that this was a most admirable building. If the builders of bygone times had known of reinforced concrete, they would have used it for dome construction, for which purpose it was well suited. In judging works of an engineering character, it should be borne in mind that they were constructed to last probably for centuries. In defence of the engineer, he felt it was only fair to say that he (the engineer) was not intended to construct palaces. Judge the engineer by his great monolithic works, and then they would be able to gauge his correct value. The paper, to him, was one of great interest, and he had much pleasure in proposing the vote of thanks.

Mr. Gerald C. Horsley seconded the vote of thanks, and, having gracefully alluded to Mr. Marshall's admirable work at Westminster Cathedral, said that in spite of the excellence of the paper, he found himself unable to agree with every opinion it expressed. Consultation with, and assistance from, the engineer should be, he believed, of the utmost value to the architect; and he did not see why the architect should not be able to design a fine building in reinforced concrete. Reinforced concrete, however, was a fearful material if any alterations were required to be made; and he believed that it could never be used in private houses or in buildings where there was any probability of future alteration. Mr. Marshall appeared to think that organic building came to an end about the fourteenth or fifteenth century, and that it was not till the time of Wren that they found a building based on scientific knowledge. They would gain a shrewd opinion of the mediæval constructors if they read the reports on old St. Paul's, Salisbury Cathedral, and Westminster Abbey.

Mr. J. H. Markham observed that it was of questionable profit to the architect to bemoan the fact that present conditions compelled him to design reinforced concrete. He had got to do it. And why the sombre prophesy that these buildings would not be standing fifty years hence? They had no opportunity of seeing how reinforced concrete buildings would stand the test of time. They were told, however, that they would improve with age, but he advised them not to rely greatly upon this statement.

Mr. Edwin Gunn observed that in some respects the functions of the architect and the engineer were almost identical. The aqueducts of Rome testified to this. The architect displayed a great fondness for hanging small pieces of stone on an engineering structure which, perhaps, was a thing of beauty considered by itself.

Mr. J. H. Elder-Duncan observed that the earliest application of the principles of reinforced concrete could be claimed by the Romans, who reinforced some of their vaults with bronze rods. The history of reinforced concrete in the modern sense might be said to date from 1823, when the first actual system was designed. In 1856 Wilkinson designed a floor in this material, and since then many patents had been registered in England and in France, in which latter country reinforced concrete was being widely used. It might be interesting to note that during the term of office of Mr. Somers Clark as supervising architect of St. Paul's Cathedral, it was deemed necessary to ascertain the condition of the chain girding the base of the dome, and that when the concrete was cut away, the chain was found to be as bright as when first put in.

The President having summed up the discussion, Mr. J. A. Marshall briefly replied.

A school for building trade apprentices has been started by the associated employers of the canton of Montmorency, France, at an initial outlay of about 50,000 francs, while the expense of maintenance is expected to reach from 12,000 to 15,000 francs a year.

LONDON COUNTY COUNCIL GENERAL POWERS BILL.

Another debate took place in the House of Commons last Thursday night on the London County Council General Powers Bill, when Sir F. Banbury moved that it be an instruction to the Select Committee on the Bill to omit sub-section 32 of clause 30. The clause contains provisions with respect to buildings of iron and steel skeleton construction. The sub-section which the member for the City of London wished to omit reads: "Any person dissatisfied with any requirement or decision of the district surveyor under this section may appeal to the Council, whose determination shall be final." The arguments covered a good deal of the ground traversed a fortnight ago, when the Bill was read a second time. The mover of the instruction contended that the surveyor was the servant of the County Council, to whom the appeal would be taken. The County Council's requirements with regard to reinforced concrete would be enforced by the surveyor, and the unfortunate builder or owner could only appeal to the surveyor's employer. He condemned artificial restrictions upon the development of reinforced concrete. The Committee could establish an appeal court if it liked upon the lines of the London Building Act of 1894, viz., three members nominated by the Secretary of State, the Royal Institute of British Architects, and the Surveyors' Institute.

Sir Wm. Bull seconded the instruction.

Mr. Walter Guinness said that under this particular section the County Council only proposed that appeals should be taken to them on the interpretation of the Act. They did not wish to have any powers of upsetting the decisions of the district surveyors on the ground of the reasonableness or otherwise of those decisions. If necessary, the Council would put that beyond doubt by altering the drafting. He pointed out that very technical matter arose, for instance, on sub-section 21, dealing with stress on iron pillars, and sub-section 24 relating to the amount of foundation necessary to take the load borne by a column. These matters required technical knowledge. The tribunal of appeal under the 1894 Act was costly, and not suited for matters of petty administration. He thought the Building Act Committee, which had skilled advice, was the best body which could be suggested at the moment. The Committee and its sub-committees dealt with 200 cases a week. Besides, an advantage to the builder lay in the fact that this Committee had certain dispensing powers. He asked the House not to accept the instruction.

Mr. John Burns said he did not feel enamoured of the present position of the district surveyor. He thought the surveyor ought to be an officer of the Council, paid, appointed, and subject to dismissal by that body. He hoped the day would soon come when fees were abolished, and when district surveyors with private practice would be abolished. At present the district surveyor was a law to himself. With regard to the proposal in the Bill, he thought it might be left to the Committee to hear the views of persons affected. He thought the Committee would perhaps modify the Bill to some extent in the direction desired by Sir F. Banbury, and he hoped the instruction would be withdrawn.

This course was agreed to.

Mr. Remnant afterwards moved an instruction to the Committee to leave out sub-section I. of clause 35, which extends the time for the compulsory purchase of lands for the widenings at Southampton Row from 1909 to 1912. He complained that for the last three years no steps had been taken by the County Council towards carrying out the powers granted them, and the reason given by the Council was that if they waited long enough they would be able to acquire the short leaseholders' interest without paying compensation. If such intention had been admitted when the powers were applied for in the first instance, he believed the House would not have given them. He thought this was a new way of carrying out an improvement which was urgently required.

Mr. Walter Guinness remarked that the practice was not new, and that three years was the usual period of extensions, although a longer period might have been originally necessary. By the extensions they were seeking, and would seek, the cost of the improvement would be reduced by one-quarter.

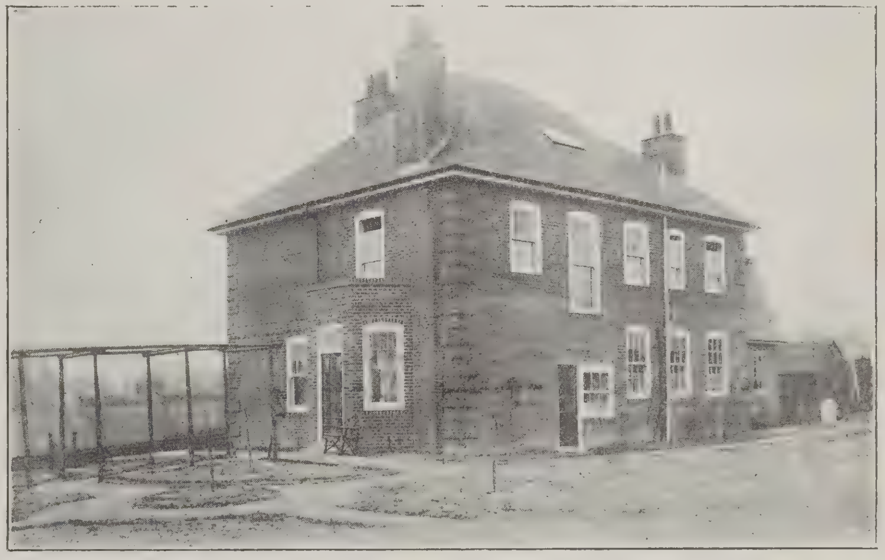
Mr. John Burns appealed to Mr. Remnant not to press his motion. If it were agreed to, the improvement would not be carried out for many years to come. He himself wished to see this improvement expeditiously carried out, as well as the one almost within the precincts of the House of Commons, namely, from Lambeth Bridge to the corner close by.

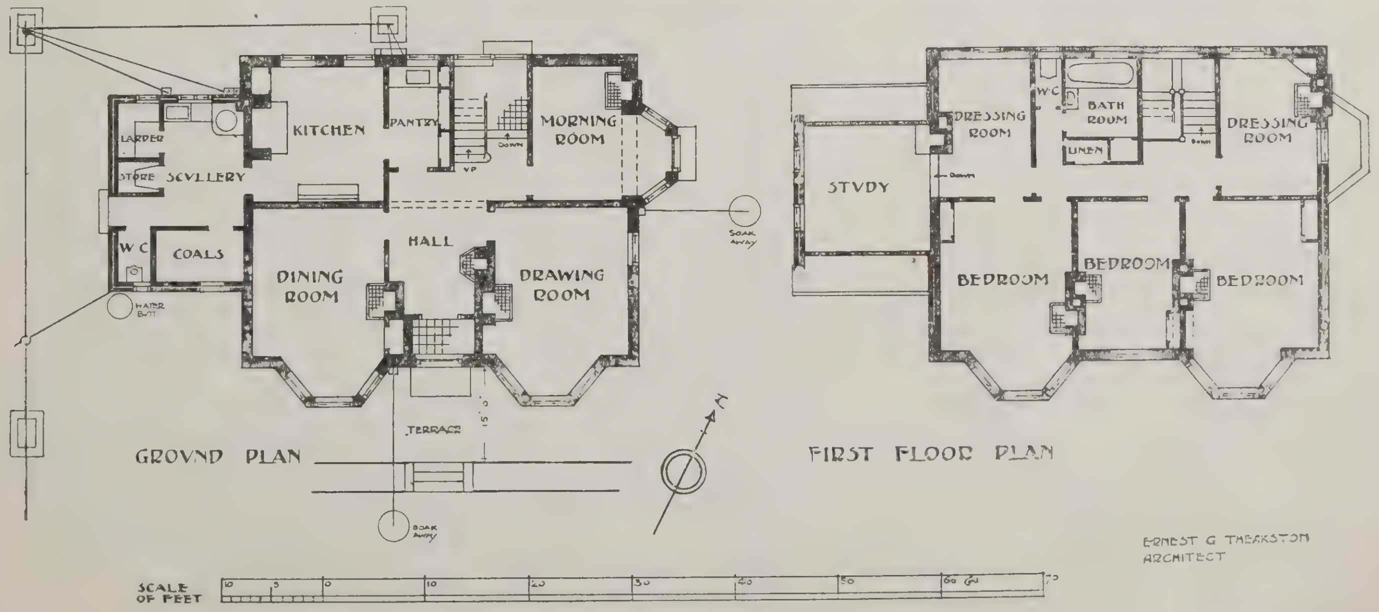
Mr. Remnant, while agreeing to the course suggested by Mr. Burns, declared that the County Council was trifling with the privileges of the House of Commons.

The instruction was then withdrawn.

HOUSE AT BERKHAMSTED.

This house is built on a high open site of about an acre, with local red bricks and tiles. The house is set back from the road some 80ft., in order to obtain uninterrupted views of the surrounding country, and to take advantage of the natural rise in the ground, which forms a terrace. The upper floor shows the study, bedroom, and dressing-room, planned *en suite* in accordance with the client's wishes. The architect was Mr. Ernest G. Theakston, of London, and the builders Messrs. J. Honour and Son, of Tring.





HOUSE AT BERKHAMSTED. ERNEST G. THEAKSTON, ARCHITECT.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
April 10.	BOLTON BRANCH PUBLIC LIBRARIES. The Libraries Committee of the Corporation invite competitive plans from architects who have been principals in the County Borough of Bolton six months prior to the present date for Branch Public Libraries to be erected in the districts of Astley Bridge, Halliwell, and Gt. Lever. The plans and particulars may be obtained from Samuel Parker, Town Clerk, Town Hall, Bolton. Deposit, two guineas.
April 12.	ELLAND NEW SECONDARY SCHOOL. Architects having offices and practising in the West Riding of Yorkshire are invited to compete for the work in connection with the new Secondary School at Elland, and should apply for particulars to Mr. Leonard Clegg, Holiwell Green, near Halifax.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading, Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second and third respectively. Assessor: Mervyn E. Macartney, F.R.I.B.A., F.S.A.
July 31.	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	BOURNEMOUTH BRANCH PUBLIC LIBRARY. Architects practising in the County Borough of Bournemouth are invited to submit designs for a new Branch Library at Boscombe. Particulars from Charles Riddle, Borough Librarian, Central Library, Bournemouth.
No date.	WALLASEY U. D. COUNCIL CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W: H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

Grimsby Town Hall Extension.

The Grimsby Town Council have decided to spend £30,000 on the above work, and are about to invite competitive designs. Premiums of £250, £150, and £75, are to be offered for the designs placed first, second, and third respectively.

Middlesbrough New Library.

The Free Library Committee have decided to ask the Royal Institute of British Architects to nominate an assessor for the above competition.

The proposal of Wimbledon Town Council to erect a new town hall and municipal buildings, at a cost of £30,000, is exciting strong opposition, and public meetings of protest are being arranged.

* * *

An "Everything for the Home" Exhibition is to be held in Bingley Hall, Birmingham, October 6th to 23rd of the present year. The organisers are the International Trade Exhibitions, Ltd., Broad Street House, London, E.C.

IDEALS IN BUILDING—FALSE AND TRUE.

Mr. M. H. Baillie-Scott, lecturing at the Carpenters' Hall on March 10th, explained that by the term "ideal" he meant an aim or aspiration of the mind, a dream which we hope to realise. We do not all, however, understand quite so well what is meant by building. Building nowadays has become a science, not an art, and it is of the art of building that he wished to speak. Art can be roughly defined as an occupation in which man seeks to satisfy, not only the needs of the body, but the aspirations of his heart.

All architecture is building which has flowered into beauty; but before we can obtain the flower, we must grow the tree. We must have an art of building first, and our builders and craftsmen must be artists, as in times past To attain to this, it will first be necessary to set them free from certain malignant ideals now generally followed.

The first of these may be called "the mechanical ideal." One aim only is followed by the modern architect and builder, and that is, to make all surfaces smooth, and all lines mathematically straight. If building is to be considered as a science, we might approve of this mechanical regularity; but art has other aims. Instead of the crude methods of the modern factory, art makes the workshop a school where materials may be educated. As an example, take oak for the material for the floor and doors and panelling of a building. It is obvious that a certain degree of smoothness and straightness is desirable. The finish to be obtained by the old hand tools, the drawknife, adze, etc., will be good enough, while at the same time expressing the toughness and woodenness of the oak, and the work will be full of character and charm. In the treatment of other materials, opportunity will be found for expressing the character of each. In the treatment of wrought iron, for instance, the best forms to be used will be those which suggest that this cold and hard substance was once in the furnace, ductile and soft. With other metals we may find a means of expressing the brassiness of brass, and the leadiness of lead. We shall find again and again, in the work of the past, that a certain degree of mechanical imperfection inevitably produced beauty. Take an old Tudor house for example. If we try to analyse the exterior, we shall find that the charm largely depends on the character of its outlines and surfaces. The ridge line is not straight, the tile courses are uneven, the walls are not vertical, nor the courses of brickwork horizontal, nor are the bricks and tiles equal in colour and shape. Inside we shall find the same absence of regularity. It must not be supposed that the lecturer wishes to advocate crookedness and the tumbledown picturesque. Expression of character must be the ideal, instead of mechanical perfection, and in striving to express character, our work will suggest the infinite rather than the finite, and that is the difference between art and science.

In looking at the creations of nature, one thing is evident, that the forms of things are always the outcome of functions. Our buildings, if they are to be true as the creations of nature, must consist of forms which are the outcome of functions. We must not, in designing a building, take a column and entablature, and then try to work them into the structure. Let us try to remember that forms and features have no reason for their existence apart from their uses, and when they arise naturally from the requirements of the building they assume an almost vital beauty.

The lecturer next dealt briefly with the ideal of novelty. Let us hold fast old things that are good, and not be deterred from accepting new things which are good, while rooting out all things that are bad. Do not accept old things because they are old, or new things because they are new. Although much of the "new art" is sorry stuff, sometimes we find the right note struck.

The commercial ideal in building is the outcome of a mind which thinks in pounds, shillings, and pence. Most of our modern buildings are entirely commercial in their functions. They are places for getting and spending money in. It is necessary that they should reek of wealth. Also they have to impress those droves of people who go about the world gaping at fine buildings.

The utilitarian ideal is the next false ideal to consider, the more insidiously dangerous because it is half true. No one can deny that our houses should be conveniently planned and fitted for our comfort. When a man is most truly himself, he can only be satisfied with Divine things; and it is the mission of man to supply this demand. We must rise above modern materialism, and believe that there are Divine things in nature and in art.

Correspondence.

The Fair Wages Resolution.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Mr. Hodge's resolution having been rejected, it would apparently be waste of time to discuss it, but for the fact that the principle of that resolution is being forced on town and district councils. There is one aspect of the Labour proposition that has been overlooked. It demands that "the contractor shall under penalty pay to all the workmen in his employ," etc. No distinctive reference is made to the apprentice or improver. If the compulsion is to pay to "all" a uniform rate of wage, surely the employer can demand a certificate of competency for "all"; for it would be manifestly unjust to expect the employer to train and educate the apprentice or improver, and at the same time be compelled under penalty to pay him the uniform rate.

Yours truly,
WM. MIDDLETON.

Law Case.

Ferro-Concrete Piles: Patent Rights Appeal.

The action which was commenced by Messrs. Hennebique and Mouchel against Mr. Edmond Coignet, Messrs. William Cowlin and Son, and Mr. G. C. Workman, in 1905, for alleged infringement of a Hennebique's patent, dated 1897, for ferro-concrete piles, was finally disposed of by the House of Lords last month.—Mr. Justice Warrington, who tried the action in June and July, 1906, held that the patent in question was valid, and that one of the defendants, viz., Messrs. Cowlin and Son, had infringed claim 1, by using certain piles at Bristol constructed under the "Coignet" system. On Messrs. Cowlin and Son appealing, however, the Court of Appeal unanimously decided that the patent in question had been anticipated. Mr. Hennebique—one of the respondents—then appealed from this decision, but on February 23rd last the House of Lords dismissed the appeal with costs.—Mr. Coignet (whose English business is managed by Mr. Workman) is thus free to continue the construction of piles under his system, either direct or through licensees.

It is not often that a contractor finds a free coal mine as an additional recompense for a contract job, but such a happy fate has befallen Mr. John Thomson, of Alloa. Mr. Thomson, in excavating the foundations for an extension to the works of Messrs. John Paton, Son and Co., of Alloa, came across what appeared to be a seam of coal, 18 inches thick, and it has been ascertained that this is the extreme westward position of the Whinhall Pit Cherry seam. About 40 tons of household coal has been taken out, and of this Mr. Thomson has generously given away 30 tons to the poor of the district.

THE LIVERPOOL CHAIR OF CIVIC DESIGN.

Mr. S. D. Adshead Appointed.

Mr. Stanley D. Adshead, F.R.I.B.A., who has been appointed to the Associate-Professorship in Civic Design in the University of Liverpool, of whom a portrait is here shown, was born in 1868, and was elected a Fellow of the Royal Institute of British Architects in 1905. Besides being a close student of town planning, he is an exceptionally skilful draughtsman, and his beautiful drawings are familiar to all frequenters of the Royal Academy, where he has exhibited as many as a dozen works at a time.

Mr. Charles H. Reilly, the Roscoe Professor of Architecture in Liverpool University, is doing splendid work in the School of Architecture; and when the University availed itself of the munificent offer of Mr. W. H. Lever, M.P., to contribute about £1,000 a year for three years for the establishment of what is virtually a school of town planning, the council determined to secure the services of the best man obtainable as Associate Professor of Civic Design.

It was considered to be essential that the candidate chosen should be able to furnish satisfactory evidence of his power to conceive original schemes for the grouping of buildings and the fitting disposition of their masses, and that he should possess the ability to express clearly and convincingly his ideas, particularly in such pictorial form as the public could appreciate. To these qualities it was desirable that there should be added the power to apply general ideas to the detailed consideration of practical and immediate problems in town planning. With these considerations before them, the committee, after a survey of the possible field, unanimously decided that Mr. Adshead most completely met the requirements.

In day and evening courses in the University, covering each a period of about six months, and systematically arranged to include lectures and studio work, special attention will be given to the lay-out of areas and the architectural problems connected with them; whilst the engineering and surveying aspects of the question will not be overlooked, but, for the first time, will be approached from the principles which should determine the architectural treatment of sites and areas of various types. In connection with the courses, a diploma and certificate in civic design will be established by the University.

In the proper equipment of the school, thanks again to the generosity of Mr. Lever, provision has been made for the formation of an adequate library and collection of maps, drawings, and designs, and for the appointment of commissioners to obtain information as to the experiments in civic design already made in France, Germany, and in America, for which purpose Professor Reilly, to whose energy the University is much indebted, has already sailed to America.

The duties of the chair (to which is attached a lecturership and a research travelling fellowship) include, beside the provision and supervision of instruction, the conduct and direction of research into the problems connected with the design and development of modern towns, including the production of drawings of schemes for the treatment of specific problems, as well as initial and historical surveys of existing work and the publication of the results of this research.

The school will open in October, 1909, and a complete prospectus of its work will shortly be issued. It will be scanned with eager interest; for the importance of considering separate pieces of architecture in their relationship to each other and to a general scheme is thus for the first time specifically insisted upon. Mr. Adshead will doubtless give special consideration to architectural composition in the fullest sense of the term; and upon the manner in which the whole problem is attacked at Liverpool University it will depend whether or not in the immediate future a special course at a School of Town Planning is to be considered to be a necessary complement to the education of every architect.

MR. STANLEY D. ADSHEAD, F.R.I.B.A.,

who has just been appointed Associate-Professor of Civic Design at the University of Liverpool.

In Parliament.

By our Gallery Representative.

Imported Joinery and Home Employment.

From information supplied by the Board of Trade, it appears that the value of imported manufactured house joinery has rapidly and steadily decreased during the past five years. The figures for the years from 1903 to 1908 were:—1903, £469,227; 1904, £332,627; 1905, £317,288; 1906, £272,949; 1907, £224,596; 1908, £209,632. The mean monthly percentage of carpenters and joiners reported as unemployed in trade unions in each of the last ten years was:—1899, 1.2 per cent.; 1900, 2.6; 1901, 3.9; 1902, 4; 1903, 4.4; 1904, 7.3; 1905, 8; 1906, 6.9; 1907, 7.3; 1908, 11.6.

Queen Victoria Memorial.

Mr. Harcourt has informed Sir Wm. Collins, who addressed to him a question regarding the progress of the Queen Victoria Memorial, that a large portion of the sculpture is completed, and that arrangements have been made to begin fixing it as soon as possible. The fountains and marble work around the base have been finished, and it is intended to remove the hoarding during April, when they will be visible to the public. Mr. Harcourt finds it impossible to name an actual date for completion of the memorial.

More Government Buildings.

Mr. Harcourt, in reply to Mr. Lane-Fox, stated that progress had been made towards a scheme for the better housing of the Board of Agriculture. A scheme was proposed for building on the site, Nos. 9, 10, and 11, Whitehall Place, and a provision of £1,500 was included in the estimates of this year.

New Wing of the British Museum.

Mr. Harcourt stated, in reply to Sir Wm Bull, on Wednesday last, that 35 men were employed at the building of the new wing of the British Museum, and 36 at the stoneyard. He understood that on March 29th an additional 25 would be employed. The contract date for the completion of the work was January 31st, 1911, and no delay was anticipated, except on account of possible bad weather.

Foreign Material in Government Contracts.

The Home Secretary having decided that contractors for his department shall be invited to send in alternative tenders, specifying separately the price for foreign and home manufactured goods in respect of the contracts, Mr. Claude Hay asked the Prime Minister whether the same principle would be applied to all Government Departments. Mr. Hobhouse, Financial Secretary to the Treasury, replied that in view of the great variety of goods which were the subject of Government contracts, the question was one which must be left to the discretion of the departments concerned. He had no objection to calling the attention of the other departments to the action of the Home Secretary.

The Old Arches of Hampton Court.

Dr. Rutherford asked the First Commissioner of Works if he would state whether the excavations now in progress at Hampton Court Palace were being undertaken by his direction; and, if so, whether he was able to give any description of them; and whether it was intended to proceed further with them.

Mr. Harcourt in reply said:—The excavations at Hampton Court Palace have been instituted in consequence of enquiries made by the late Mr. Fitzgerald, Acting Inspector of Ancient Monuments to the Office of Works. They are being carried out with the approval of His Majesty, and by my authority. The work is entirely in the hands of my Department. The remains of the ancient bridge, which is believed to have spanned the moat at the great entrance, have been unearthed. It is hoped that it may be possible to remove the soil from it and to expose the original moat.

NEW MUNICIPAL WORKS.

The Local Government Board has decided to hold, or has recently held, as indicated by the respective dates, inquiries into proposed expenditure by public bodies as follows:—Water Supply Works and Plant: Driffield R.D.C., £3,650 for Nafferton (March 25); Kingsbridge U.D.C., £800 (March 25). Electric Light Power Supply Works and Plant: Lowestoft U.D.C., £2,000 (March 23); Hastings B.C., £5,000 (March 23). Sewerage, drainage, and sewage disposal works and plant: Tewkesbury R.D.C., £20 for Ashchurch (March 23); Wetherby R.D.C., £2,3000 for East Keswick (March 24); Rotherham R.D.C., £9,875 for Laughton-en-le-Morthen (March 24); Hemsworth R.D.C., £937 for South Hiendley (March 23); ditto, £320 for Ashton-cum-Aughton (March 25); Uckfield U.D.C., n.a.s. (March 24); Limehurst R.D.C., £1,480 and £2,890 for Bardsley and Waterloo (March 25); Sheffield C.C., £6,130 (March 25); Hastings B.C., £105 (March 23); Newquay U.D.C., £11,000 (March 24). Street improvements, widenings, new roads, public walks, and pleasure grounds: Hanley B.C., no amount stated (March 18); Padiham U.D.C., £12,064 (March 24); Liversedge U.D.C., £980 and £690 (March 23); Odbury U.D.C., £2,600 (March 26); Lowestoft B.C., £434 (March 23); Willesden U.D.C., £16,708 (March 24); East Ham B.C., £3,515 (March 18); Kingston-upon-Hull C.C., £5,434 (March 26); Sheffield C.C., £2,650 (March 26); Atherton U.D.C., £11,739 (March 25); Hastings B.C., £2,272 (March 23); Newquay U.D.C., £2,000 and £1,860 (March 24). Various: Norwich C.C., £2,300 for underground conveniences (March 22); Atherton U.D.C., £400 for gasworks (March 25); Penistone U.D.C. £1,000 for cattle market (March 23); Uttoxeter, £3,000 for cattle market. Water supply works and plant: Basford R.D.C., £4,000 for Ruddington (March 31); Neath R.D.C., £697 for Michaelstone-super-Afon Lower (March 30); Godalming B.C., £9,535 (April 2); Hexham R.D.C., £400, for wall (March 31); Uttoxeter U.D.C., £5,000 (March 24); Belper R.D.C., £12,000 for Denby, Horseley, Horseley Woodhouse, Kilburn, and Smalley (March 30). Electric light and power supply works and plant: Leyton U.D.C., £1,650 (March 31). Sewerage, drainage, and sewage disposal works and plant: Dunstable B.C., no amount stated (April 2); Weetslade U.D.C., £3,000 (April 1); Aberavon B.C., £114 (March 31). Street improvements, widenings, new roads, public walks, and pleasure grounds: Congleton B.C., £1,200 (April 1); Chester-le-Street R.D.C., £1,174 for Birtley (March 31); Woodford U.D.C., £830 (April 2); Higher Babington, £1,660 (March 30); Merton U.D.C., £1,821 (March 29); Wood Green U.D.C., £3,900 (March 30); Great Crosby U.D.C., £1,200 (March 31); Aberavon B.C., £600 (March 31); Richmond (Surrey) B.C., amount not stated (April 2). Various: West Bromwich B.C., £11,000 and £756 for refuse destructor (March 30); Acton U.D.C., £250 for footbridge (April 1); Dudley B.C., £2,250 for refuse destructor (March 31); Willenhall U.D.C., £107 for urinal (April 1); Newton and Llanllwchairan U.D.C., £600 for refuse destructor (April 1); Neath R.D.C., £203 for gas mains at Michaelstone-super-Afon Lower (March 30); Penarth U.D.C., £300 for fire station (April 1); Aberayron U.D.C., £1,000 for public slaughterhouse (March 29); Morpeth R.D.C., £300 for bridge at Low Angerton (April 2); Aberavon B.C., £7,450 for gas undertaking (March 31).

Our Plate.

The design illustrated in our centre plate is that awarded the first place in an open competition for the new Y.M.C.A. building at Merthyr Tydfil. The structure is planned in three blocks suitable for erection one at a time, and we understand that the front and middle blocks are to be proceeded with at once, at a cost of about £5,000; leaving the rear block, containing the large hall, etc., to be erected later. The site is a very sharply sloping one, there being a difference of no less than 30ft. between the front and back roadways. The front block will contain on the ground floor:—Two shops on one side, and a large café, with kitchen behind; on the other side of main entrance: on the mezzanine floor, a billiard room for two tables, smoke room, and two ladies' rooms: on the first floor, which is level with the back road, a committee room, secretary's room, library, and reading rooms; on the second floor, games rooms, and a committee room; and, in the roof, a rifle range. In the middle block there is (mezzanine floor level) a lecture hall for 105, divisible into two parts; on the first floor, a reception hall and lounge; on the second floor, games rooms, stores, slipper and shower baths; and in the roof, accommodation for the caretaker. The facings are to be of face brick with terra-cotta dressings. The architects are Messrs. Ivor Jones and Percy Thomas, of 18, St. Mary Street, Cardiff, whose design in a competition for a similar building at Pontypridd last year was placed second.

A party of delegates from the Garden City Association will leave London on April 8th for a tour of inspection of the great cities of Belgium and Germany, including Brussels, Cologne, Dusseldorf, and Frankfort.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

THE CONCRETE INSTITUTE.

The monthly meeting of the Concrete Institute was held on Thursday, March 18th, at the Royal United Service Institution, Whitehall, S.W. There was an excellent attendance, over which Mr. A. Ross, M.Inst.C.E., the Chief Engineer of the Great Northern Railway Company, presided. Among those also present were Mr. E. O. Sachs, Mr. E. P. Wells (hon. treasurer), Mr. H. Kempton Dyson (secretary), Mr. Herbert Brooks, Professor Hy. Adams, Mr. Chas. Reid, Mr. Percy Tomey, Mr. Lucien Serraillier, etc.

Mr. Sachs at the outset stated that the membership of the Concrete Institute, at their last meeting, was 551, and now it was 585, which made one new member per day since the last meeting.

Mr. E. P. Wells then read a paper on "Concrete in Arched Bridge Construction," which was illustrated with limelight views and diagrams.

The lecturer explained that he intended to confine himself principally to pivoted arches, which were theoretically and practically the only form of plain concrete arches that ought to be constructed, and he would show how pivoting at both the springings and centres came to be adopted.

Curve of Equilibrium.

Previous to the adoption of the pivot at both the springing and centre of the arch, it was felt by German engineers that some method should be adopted whereby the curve of equilibrium could be absolutely confined with the centre third. It was well known that in a stone arch it was almost impossible to ascertain where the curve of equilibrium would run, as everything depended on perfect construction, especially in the grouting of the joints, etc.; any defects in grouting up would cause an alteration in the curve of equilibrium, and in all probability might endanger the safety of the structure. It was this difficulty in bedding stones of large area that had compelled engineers to put such a large amount of material in stone arches so as to be on the safe side.

Pivoted Bridges.

The first pivoted concrete bridge from the design of the late President von Liebbrand that was constructed in Wuttemburg was a large one, viz., 164ft. span, and was the pattern in respect to facilitating erection, reducing the dimensions in the arch, and the use for the first time of the pivot at the springings and centre, which since then had been invariably adopted for concrete arch construction on the Continent, excepting those cases where the concrete had been reinforced with steel, and the arches made with fixed springings and practically continuous from abutment to abutment.

Constructien of Concrete Bridges.

The lecturer then proceeded to describe the construction of a concrete bridge having a span of 150ft. with a rise of 19ft.; this bridge, the dimensions of which he gave, was strong enough to carry the heaviest possible vehicular traffic, as also the heaviest railway traffic, and to carry a load of over 3cwts. per foot super, on one-half, with the other half unloaded, and all this without the use of steel in its construction; but if steel were used then the loads could be very materially increased.

The principal reason why these concrete bridges were so safe under unequal loading was due almost entirely to the pivots at the springings and centre, which compelled the curve of pressures to pass through the same, the only sensible variation in the curve being at the haunches; even the loading given would not in any case alter the curve so that it passed above or below the middle third. Such being the case, it would be observed that no part of the arch could be in tension; but should such a thing happen theoretically, the spandril walls, by their great rigidity, would prevent any distortion of the arch; and, if the spandril walls and tables were reinforced, it would be possible to put a tension of 10 to 15 tons in either the extrados or intrados without the structure collapsing or changing its form.

Another advantage that a concrete arch possessed over a brick or stone arch was its homogeneity, there being an absolute lack of joints which were an element of weakness, as was the mortar in the joints; *e.g.*, in the case of a granite arch, 1-20 the crushing strength of the stone itself if made of lime and ¼ the strength if cement grout were used—then why use a material that was stronger than the weakest part?

The Arch.

In designing a concrete arch, it would be found necessary to start on the assumption that the thinnest part of the arch, viz., at the centre, is approximately one-fiftieth of the span; this you must increase at the springing by about 7 per cent., and at the haunches by about 27½ per cent., to allow at this point for varying loads tending to make the curve of pressures rise or fall either below or above the neutral axis, and so to always keep the said curves within the middle third.

Having then apportioned the sizes of the spandril walls, or spandril pillars, to the loads that the bridge is intended to carry, also the intermediate tables and tables to carry the vehicular and foot traffic, proceed to ascertain the weight of the structure and find the curve of equilibrium for the dead load only; having ascertained that make it the neutral axis of the arch, and alter the shape of the extrados and intrados by compounding the curves so as to make both equi-distant from the netral axis. The normal condition of a concrete bridge was its dead load, and the greatest stresses were set up by the dead load; so the lecturer considered that, unless extraordinary loads were to be passed over the bridge, it was not necessary to take into account the live load, especially if it were only ordinary or vehicular traffic. If the curves for equally distributed loads and also for one half of the arch loaded were worked out, it would be found that the curve of equilibrium at the haunches did not vary more than 3in. either above or below the neutral axis; in the case of a heavy rolling load, it was only when the load was at the centre of the span, or a few feet on either side of it, that the increased stresses at that point in the arch could be accurately calculated; because nearly the whole width of the arch, from the point under the load to the springing, took up the stresses induced, and the same were reduced to a minimum by the enormous area of arch that they were spread over; the reason why concrete arches were so strong was that the stresses induced by the weights were so well distributed; otherwise there would, no doubt, be distortion of the arch and great deflection at the centre, whereas in no case, where exhaustive tests had been carried out, had this been proved.

Under this circumstances it was perfectly permissible to reduce the thickness of the arch until the stresses amount to 36 tons per sq. ft.; but it would then be required to ascertain the positions of the curves of equilibrium for dead load, equally distributed live load, and also for one-half of the arch loaded, and likewise for the maximum rolling load placed in the centre of the span; the neutral axis could then be made the mean of all the curves.

The effect of this would be that at the haunches, for dead load only, the compression at the intrados would be slightly increased, and correspondingly reduced at the extrados; the curve of the intrados would not require so much compounding, but would be more segmental in form, unless they were placing excessive dead loads on the haunches, when the curves of pressure would rise, and so enable the curves of the intrados to be compounded and the appearance of the arch very materially improved.

If it were possible in concrete arch construction to make the arch so that the dead load were equally distributed, then the curve of equilibrium would be a parabola; but the appearance of the arch would suffer, though theoretically correct.

Spandril Walls.

In all cases the spandril walls, and also the concrete filling over the arch beyond the spandril walls at the centre, should be bonded to the arch by means of stone figs, or old iron rods, in the shape of bolts, etc., etc., as by this means any separation taking place between the extrados of the arch and the spandril walls could be absolutely prevented, and the cementitious nature of the concrete had not to be depended upon, which was not always desirable unless very great care be taken in roughing the concrete and making the same absolutely clean.

Centerings.

The centres needed for the erection of a concrete arch were similar in every way to those required for a stone or brick arch, with this exception, that less strength was wanted, owing to the fact that a concrete arch weighed less. Where it was required to construct the whole arch of concrete, and make imitation stone voussoirs, special shuttering must be made.

Order of Fixing Voussoirs.

It was advisable, when forming the concrete voussoirs, always to place the first voussoir between the points of support of the centres, not over the supports; thus, if any deflection was caused by the weight, it was put into the beam before the remaining voussoirs were made. In closing in with the voussoirs, Nos. 3, 5, 7, 9, and 11, care should be taken that the faces of the existing concrete voussoirs were thoroughly clean and well roughened; and, as the concrete was brought up, neat cement grout or 1 to 1 cement mortar put on the faces of the existing concrete, so that a perfect bond was obtained between the new and the old. When ramming the concrete, care should be taken that the existing faces of the voussoirs were not in any way damaged. To prevent this it was advisable to use special hardwood rammers. Lest, by any chance, the faces of the voussoirs previously put in should be honeycombed, some 1 to 1 mortar should be used to fill up all interstices previous to the concrete being filled in. After the completion of the voussoirs Nos. 2 to 12, it became necessary to adjust the granite blocks.

Pivots.

The pivots should be made of the best annealed cast steel, carefully machined all over to uniform thicknesses; the rolling curves should be machined and finished to a dead smooth surface, the pivots being forced into the bearing plates by hydraulic pressure; if it be found that the faces of the pivots were not parallel with the bedplate, then the back of the same must be re-machined. The granite bearing stones must be recessed for about 1 to 1½in., and the bearing surface bush axed or (which is preferable) sand rubbed, as it was advisable that there should be no inequalities in the stone to prevent a perfect bearing being obtained. The stones should be made in about 2ft. 6in. lengths, and the pivots should be about 1in. less in length. The joints for these stones should be about ¾in., and were not to be made until after the final concrete voussoirs were filled in.

Before fixing the pivots in the stones, sheet lead, about ⅛in. thick, should be put in the recess in the stones, and the pivots laid in and well hammered with a heavy wooden mall; after which the stones should be fixed in position, and very great care exercised in gauging the distances between the rails, so as to ascertain whether the bearing of the two rails is true; any inequality in the position of the stones could be obviated by packings laid on top of the laggings.

Use of Screw Jacks for Fixing Pivots.

After all the stones were in their correct positions, it would be necessary to obtain four screw jacks so as to force the pivots as close together as possible, and at the same time put a certain amount of compression on the lead seatings; when this was done, 2in. square iron or steel bars shall be forced between the back of the stones and the concrete voussoirs Nos. 2 to 12, so as to prevent any movement when the screw jacks are taken away. After all the stones were placed in position the concrete voussoirs Nos. 1 and 13 should be filled in; the voussoirs in the centre ought to be filled in simultaneously.

Roadway.

After the centres were finally struck, the concrete over the arch, forming the roadway and footway, might be filled in, care being taken to make an expansion joint over the pivots in the centre of the span, and also at the swinging pivots. In this country a joint ⅛in. was sufficient at the centre, and the same could be made with soft felt; but at the springings, if the concrete be put in in cold weather, fully ½in. must be allowed. In forming the roadway, whether of wood paving, granite pitching, asphalt, or macadam, the expansion joint might be ignored, though one must be put in on the footways, especially if the same were made of York paving or concrete. In order to allow the arch to expand, the outer spandril faces must not be bonded to the abutments or piers, but be recessed into the same so as to allow perfect freedom of action; this also applied to the parapet and cornice, because, if securely fixed, an accident was bound to happen in winter if the bridge were completed in summer, and vice versa.

The lecturer then described some tests on a model bridge of 150ft. span to a scale of ½in. to the foot, and then described a few of the principal concrete bridges that have been erected abroad, commencing with the Coulouvrenière Bridge across the Rhone at Geneva. These were illustrated by means of lantern slides. Finally, the lecturer made extended remarks on the making of concrete and the proper proportions that ought to be used for different kinds of work. The results of many tests and experiments on concrete carried out by the lecturer formed addenda to the paper.

Discussion.

At the conclusion of the paper, the Chairman said they had had a very excellent paper, full of practical results and practical advice. His only regret was that Mr. Wells had been obliged to pass over a lot of most useful things, including the making of concrete, the proportion of materials, tests of concrete, materials to be weighed and not measured, concrete made of Thames ballast, and mixing by machine and by hand.

PROFESSOR HENRY ADAMS said he thought the Concrete Institute was much indebted to the author for his paper, which he thought might be described as almost of monumental size, representing the cream of a ripened experience. It contained a large amount of practical information, so much, in fact, that it was difficult to grasp all of it in one sitting. The chief value of some papers lay in the discussion upon them, but this paper had great merits of its own. In the commencement of the paper, the author said that engineers in the past had only considered concrete good enough for retaining walls and foundations, and that some engineers did not place much faith in it, even for the latter work. That was rather in the nature of news to him. He had thought that if engineers had any faith in anything at all it was in concrete foundations. Mr. Wells spoke of from 2 to 2½ tons per sq. ft., the concrete being made in the proportion of 4 to 1 for foundations. If that was a fact, he thought it was the exception that proves the rule.

Mr. Wells said that that was the fact with the Prince of Wales Pier at Dover.

Professor Adams, continuing, said that engineers could not, as a rule, afford to put in concrete of such value as 4 to 1, except in certain cases where the foundations were very thin and spread out, and reinforced with metal, and then naturally the stronger concrete was used. With regard to concrete being able to carry with perfect safety 100 tons per sq. ft. two months after being made, although it only had to carry 2 to 2½ tons, it should be remembered that the intensity of the load was on the top, and that the spread must suit the soil below, which must be always very much less. Mr. Wells spoke of pivoted arches as theoretically and practically the only form of concrete arches that ought to be constructed. That applied where rolling loads were carried, which gave a lopsided curve of thrust when the load was over one of the haunches, and pivoting practically eliminated that difficulty. Mr. Wells mentioned the centre third of the arch as the part where the curve of equilibrium should be contained. He did not mention a very common fallacy with regard to the middle third. It was commonly supposed that when any line of thrust passed within the middle third of a bearing surface, the joint was safe. The middle third only gave them this result, that they knew then that there was no tension on either side of the joint, but that might still be so, and yet the construction might fail from intensity of pressure, with which the middle third, of course, had nothing to do. It was almost impossible to ascertain where the curve of equilibrium would run, the author said. That was so, but there was a natural curve of equilibrium without any conditions of loading, and the shape of the arch should, as far as possible, conform to that curve. It was the inability to conform to it with a rolling load that necessitated the pivot arches. With regard to the settlement of arches, it was most important to have rigid abutments and thin joints, otherwise settlement must take place, and alteration in the distribution of pressure would follow. Mr. Wells described a bridge where lead was used in the springing in the centre. It had, he had thought, been practically decided by architects, who had tried it frequently in the case of stone columns made in pieces and heavily loaded, that the lead was subject to a pressure that might be described as like a hydraulic pressure, which caused a spreading or spalling of the stone at the joint. In the case mentioned by the author, the lead was kept well within the outline joint, no doubt for that reason, and with probably no danger to the joint. He thought Mr. Wells was a little out in his figures with regard to the mortar in the joints in the case of a granite arch being one -twentieth of the crushing strength of the stone itself if made of lime, and quarter the strength if cement grout were used. According to his information, the figures for the crushing strength of granite were from 1,500 to 2,00 tons per sq. ft., while grey lime mortar was only from 5 to 15 tons. The greatest stress in an arch often occurred when only half the span was loaded, unless it was pivoted. The author said that if the span were loaded with 2cwt. per sq. ft., the maximum stress would not exceed 24 tons per sq. ft. He seemed to speak of a load over the whole bridge as giving a maximum stress, but probably half the load over half the bridge would give a greater maximum stress, owing to the distortion of the curve of equilibrium when there was no pivoting at the ends. The settlement when the centres were struck was mentioned, and he would like to enquire from the author whether he had found any difficulty from the settlement of the arch breaking the connection with the spandril walls. He thought that would be likely to happen. With regard to the testing of models, that was a very interesting thing to do, but personally he did not put much faith in the testing of models; they were, as a rule, stronger than the structure they represented, for various reasons, the principal of which was that the linear dimensions varied directly as the scale, but the sectional area of the members varied as the cube of the scale, so that they did not get the same proportion in strength and size between the model and the real structure unless allowance was made for those points. As to the advantages of Portland stone, they were very well put by Mr. Wells, and he thought that was generally admitted to be, because it was just sufficiently porous to get a good key with the cement mortar. Flint, gravel, and granite were too unabsorptive to be able to get a proper key with the cement.

Mr. CHAS. REID said the interest of the paper which they had heard read seemed to be in the question of constructing bridges of concrete with pivoted joints, but he thought when he came there that he would hear more of reinforced concrete arches. He took it that nearly all the arches which Mr. Wells had spoken about were not reinforced concrete arches at all, but pure concrete arches, made without reinforcement, and pivoted in the way described. That pivoting, as the lecturer had said, had been very highly developed by the German engineer. It allowed of very great economy in the material, and of very flat arches being built, which otherwise could not be done; but those same conditions, he took it, would apply to arches of stone as well as of cement, and the action would be just the same. From many of the designs of reinforced concrete arches which they saw, it seemed to him that the principle there generally was to combine the arch with the abutments, and there were many designs he had in his mind in which the iron reinforcement was carried right down into the abutments and piers, and there made one with the arch, so that it gave a monolithic structure. There were many points of interest in the paper. He had had several structures of ferro-concrete under his charge, and it was very useful to make experiments one's self with the concrete as it went on. He quite agreed with what Mr. Wells pointed out, that the concrete as made now was of such a high quality that there might be much higher stresses put upon it than was usually done. He thought that generally the stresses mentioned by Mr. Wells ranged from 30 to 35 tons in the highest. With regard to putting higher stresses than that on the work, they must remember that, although they might have a test piece that would stand much higher stresses than that, still, in a large structure, they were not at the present moment quite certain that the whole of the material in the structure was of exactly the same character as any one particular block. It was the thing they were all trying for—to get that absolute uniformity in the manufacture of the concrete which was desirable—but he knew very well from his experience that they might have some very good concrete work done one day, and yet on some other day, owing to the weather, or perhaps to the conditions of labour, or what not, the concrete would not be so good. He thought it was much more reliable to test blocks of one foot cube than of four inches, which was often done. He had one interesting experience in testing some blocks or columns. They were about 10 inches sq. and 4ft. 6in. long, and tested as columns. Several of them were made with different kinds of reinforcement, and one or two without any reinforcement at all. They were tested at the School of Technology in Manchester. The reinforced concrete columns broke, as far as he remembered now, from about 230 up to 270, or nearly 300 tons per sq. ft., and, strange to say, the column that was not reinforced at all stood 316 tons per sq. ft., and showed in that respect very much better results than the reinforced columns. There were a good many suggestions as to the reason for that. He was not at the making himself, but the resident engineer he had there explained to him exactly what had taken place, and he thought the reason why the one stood so much more than the other was clear. When they were making a reinforced concrete column or girder of any kind, they had their mould to make, and they had to fix their iron rods with it, and often, as they knew in ferro-concrete structure, the iron became very complicated, and it was very difficult to get the concrete in properly between it. The men rammed all the columns, but those that had the iron in them were not so easy to ram as the one that was without any iron. They had a good plain box, and they could ram as much as they liked, and the result he had mentioned was due simply, he thought, to the fact that the concrete was better rammed in the one case than in the other. He just gave that as an instance of what little things affected the strength of concrete and samples in that way.

Mr. PERCY TOMEY said there was one point that had struck him, and that was that the question of reinforced concrete arches had not had quite as much attention as ordinary plain concrete arches. He had, however, expected from the title of the paper that the plain concrete would have the more attention. If reinforced concrete was an elastic material, as they were supposed to believe, why should they go and put in plain concrete with the pivot? If they were going to have an elastic material in reinforced concrete, it seemed to him they could reduce the thickness of the arch very much, and the question of the extra amount of steel required would not make very much difference.

Mr. HERBERT BROOKS said he wished to ask Mr. Wells whether he had any knowledge of the results of the experiment made a short time ago in Germany with the Dusseldorf Bridge. It was probably known to Mr. Wells that a few years ago—he thought in 1902—the Union of German Portland Cement Manufacturers built an exhibit at the Dusseldorf Exhibition, which included a bridge of a very substantial kind. The bridge was left standing until last year, when it became necessary to clear it away. Having the desire to obtain a practical test on a scale which had never hitherto been obtainable, the Union of German Portland Cement Manufacturers asked the German Government to join with them in providing a substantial sum of money for the purpose of loading up the bridge to breaking point. He was the guest of the Union in Berlin last week, and at a meeting there was thrown on the screen before the close of the proceedings a number of views of the operations in connection with the breaking down of that Dusseldorf Bridge. Unfortunately the time was so short that the details could not be given, and the only statement practically that was made was to the effect that the factor of safety was exceeded 23⅛ times. That was, he believed, the largest practical test which had been made with a concrete bridge, and it would be exceedingly desirable if they could have the actual facts in connection with that test submitted to them. Did Mr. Wells know them? He would like to say how much indebted he felt personally to Mr. Wells for the exceeding pains he had taken in giving them that most interesting and useful lecture. Before leaving Berlin he met several members of the Executive Committee of the German Concrete Union, one of whom, knowing he was an Englishman and was connected with these matters over here, alluded to what he had heard of the recent formation of the Concrete Institute here, and said how exceedingly glad the German Concrete Union would be to exchange information and to report upon tests, and exchange results of all practical tests which they were making in various branches in ferro-concrete work in Germany with this new body that had arisen over here, and how glad they would be to welcome the members of the Concrete Institute to their annual meetings, and to exchange information and visits with them. He (Mr. Brooks) took that first opportunity of conveying to the Concrete Institute that message, which was exceedingly friendly, and he was sure it was given, not merely out of professional friendliness, but also out of a desire to manifest the spirit which had certainly become much more noticeable in Germany to Englishmen who went over there since the King's recent visit, which had done so much to improve the relations between the two countries.

Replying on the discussion, Mr. E. P. WELLS said that as to the question of engineers not liking concrete for retaining walls, he had known of cases where they would not use it for retaining walls at all. There were a great many retaining walls put up even now, with nothing but brickwork, the only concrete in them being simply the foundations, where it was a question of going down to depth. He was not surprised at that when he remembered some of the concrete he had seen put in. In reference to a remark made by Prof. Adams about the lead spalling, in the case of the Kirchheim Bridge, it was put in in short lengths, with a space of 3 to 4 inches between each piece of lead, so that it was perfectly free to move in every direction until it came to its true bearings, but the pressure per sq. inch on the lead was not sufficient to cause any spreading. If they got a good hard lead it was safe to do it, but if they got a soft lead and put 1,500 to 1,600 lbs. pr sq. inch pressure, they would find that it would squeeze slightly. With reference to the settlement of an arch made in connection with spandril walls, he had never known such an instance; it was the pivoting that prevented it. With regard to Portland stone cement, he experimented with that 10 or 11 years ago very largely indeed, but if they wanted to get an excellent concrete they must soak their stone in water first, then mix their sand and cement, dry it, dump the wet stone in that, mix together, and add water as required. They would then get an absolutely perfect concrete. In reference to reinforced concrete arches, that was a matter for future treatment, but that evening he was speaking especially of plain concrete arches, for which he had a greater liking, particularly for large-span arches, where there was heavy traffic, as there was an absolute absence of vibration, they carried enormous loads, and architecturally they were very much to be preferred. They could make a handsome bridge with plain concrete, whereas it was most difficult with an ordinary reinforced arch to make it look well. If they put ornamentation, they were condemned, and if they left it absolutely plain people said: "What a beastly ugly thing," but with a plain concrete arch they could put very little ornament, and yet it looked a fine structure. With regard to testing pieces only, the builder of the Vermier dam cut down right into the heart of the dam, and found that the concrete crushed at 360 tons per sq. ft., which was a greater strength than he would have got with the ordinary test cubes. With reference to the plain concrete column mentioned by Mr. Reid, he was not at all surprised that the non-reinforced carried more than the reinforced. It, however, was a matter for further discussion. He was a great believer in pivoting an arch, and they could put it in a reinforced arch. With reference to Mr. Brooks's query, he knew nothing about the experiment with the Dusseldorf Bridge. He was not surprised that the factor of safety was exceeded 23½ times. The proportion that the Germans used in concrete bridges—the test they got—was generally about 450 tons per ft. at two months old. If they waited for a number of years, taking the working stress they put on at about 20 tons per ft., it was easy to see how they got a 23½ factor of safety. No one knew very much about concrete at present, because the experiments had not been carried over a sufficiently long period, and when they were made they were very often made with different kinds and makes of cement, with different men doing it, instead of all being made simultaneously by the same men with the same makes, in which case they could arrive at some definite result.

The CHAIRMAN said the paper had been most interesting and valuable. He thought Mr. Wells had been rather hard on the railway engineer. He happened to belong to that much-abused class, and for his own part he had used concrete for foundations and piers of bridges and abutments for many years back. From the outward appearance, he had a feeling against the face of a concrete abutment, however. It was invariably streaky—some vertical and some horizontal—and he covered up his concrete by facing it with brindled or blue blocks. In the Great Northern, on the heavy clay lines, where retaining walls were required to be of the best, they were always of concrete, but he must confess that they were hidden up in the way he had described. There was one thing he must say about arches, were they of brick, stone, concrete, or reinforced concrete, to the railway engineer and the man who had to maintain things afterwards, they were always preferable to steel, where there was a constant maintenance expenditure going on, probably equal to a fair interest on the capital expenditure, and were it for no other reason than that, he for one should always encourage and support any means by which they could get structures other than metallic structures for purposes of that sort. In conclusion, he moved a hearty vote of thanks to Mr. Wells for his extremely valuable paper.

CONTRACTOR AND SUB-CONTRACTOR.

The position of the sub-contractor has been considerably strengthened in consequence of the action that has been taken by the Tees-side and District Master Builders' Association, who have persuaded the Hartlepool Corporation, and other bodies as well as many architects, to approve of the terms of a new form of agreement between the principal contractor and the sub-contractor. The main provision in this form is said to be as follows:—"The contractor will pay for the work hereby agreed to be done in the manner following. The contractor will, on receiving payment of any certificate in which a sum is allocated to the said work, forthwith pay the sub-contractor the sum so allocated and received by him. On receiving payment of any interim certificate in which no sum is allocated to the said work, the contractor will forthwith pay to the sub-contractor such a sum as will with any previous sum or sums paid on account, make up (a percentage to be agreed upon) of the value of the said work executed at the date of the giving of such certificate, and on receiving payment of the final certificate the contractor will pay to the sub-contractor the balance due in respect of the work. Whenever the contractor is entitled to receive a certificate on account of work done under the said contract he shall, before applying for or immediately on receiving the same, if such certificate has not been applied for, give notice to the sub-contractor in writing that he is about to apply for or that he has received a certificate, as the case may be." The agreement, it will be seen, if generally accepted, will place the sub-contractor pretty much on an equality with the principal contractor, and will make his position more secure.

CONCRETE AND STEEL CONSTRUCTION AT THE SELFRIDGE STORES.

By S. Bylander.

(In previous issues we have described the most interesting methods used in the construction of the Selfridge Store. We dealt extensively with the fireproofing in the fire-resisting construction section of March 17th. We continue the description of the foundation work and steel work. The description of the ferro-concrete flooring, ventilation, heating, artesian well machinery, etc., will be resumed in the next concrete and steel section. As the steel construction work is a principal feature of this building, we are glad to be able to reproduce here several drawings and photographs which the contractors, Messrs. Waring and White, have courteously placed at our disposal. We are also much indebted to the contractors' engineer, Mr. S. Bylander, for his courtesy in affording the architectural and engineering profession a detailed description of the interesting work that has been carried out on this remarkable building.—Editor.)

Reinforced Retaining Wall.

A reinforced wall, 60ft. deep, was built to retain the earth and street, opposite that portion of the building which has three basements. The magnitude and difficulty of the work of construction may be realised when it is considered that a trench next to the street, with four-storey buildings opposite, 40ft. away, had to be excavated 25ft. wide, 100ft. long, and 60ft. deep. The timber work for the strutting was in itself a complicated part of the work. Arrangement had to be made for placing in position 6-in. channel-iron and 1¼in. bars, 40ft. long, for the reinforcement of the wall. The difficulties of constructing a reinforced retaining wall increase very rapidly when the height exceeds 30ft., because reinforcing bars cannot be obtained in one length, the placing of reinforcement becomes difficult, and the thickness of the wall must be great in order to reduce the amount of reinforcement required, and also to reduce the stresses on concrete, as the "actual" stresses in concrete of great thickness and formed quickly are somewhat uncertain. If the reinforcing bars at the back of the wall are placed too close together, it is difficult to fill in the concrete, and the concrete at the back of the reinforcement is liable to chip off and destroy the bond between the concrete and the bars. However, with the use of channels and alternate spacing of bars, no difficulty was experienced, and the wall was rapidly built and has retained the earth perfectly, without showing any sign of weakness. The wall is of uniform thickness, and no buttresses or counterforts are used.

In order to provide for the stability of the retaining wall, and also to form a foundation for the piers of the exterior wall, the base or toe of the wall was made 25ft., and so proportioned that the load on the ground is about the same under the toe of the wall as for the other foundations.

On account of the great height of the wall bars could not be obtained in one length for the main reinforcement, and it was not thought advisable to entirely thrust the overlap of two bars placed on the tension side of the wall. For this purpose light channels were used, which were bent and spliced with fishplates, thus forming a continuous and reliable main reinforcement where the greatest stresses occurred. The load from the piers was spread with one layer of grillage beams and the base of the wall, which is a continuous slab, is reinforced with 1¼in. Indented steel bars top and bottom. The back and front of wall is reinforced with ¾in. Indented steel bars placed horizontally to prevent shrinkage cracks.

All the other retaining walls were built in ordinary concrete. The formula for all retaining walls was one cement, two sand, and four gravel, mixed in a batch mixer.

A ¾-in. thick asphalte damp-course was placed at the back of retaining walls and

under all foundations, and what is practically a watertight concrete tank was formed for the basements.

The excavation for the retaining walls was made before the dumpling was taken out. A view of the strutting for one of the trenches is shown in Fig. 2. This illustration also shows the track for the travelling crane, as well as part of the steelwork erected in the third basement. In Fig. 3 is shown the same part of the building at a more advanced stage of construction.

Underpinning.

The contractors proceeded with the underpinning of the walls of the adjoining buildings quickly and systematically. Pits were excavated in lengths of 6ft., and in width from 10ft. to 14ft., to suit the foundations. The new wall was built in piers, and was finally completed before the excavation of the site was carried out.

The underpinning of the walls, erection of retaining walls, excavation, and putting in of grillages and foundations, were executed very quickly and efficiently in spite of great difficulties. For instance, in one case it was necessary to prepare a scheme for the underpinning of a five-storey building above

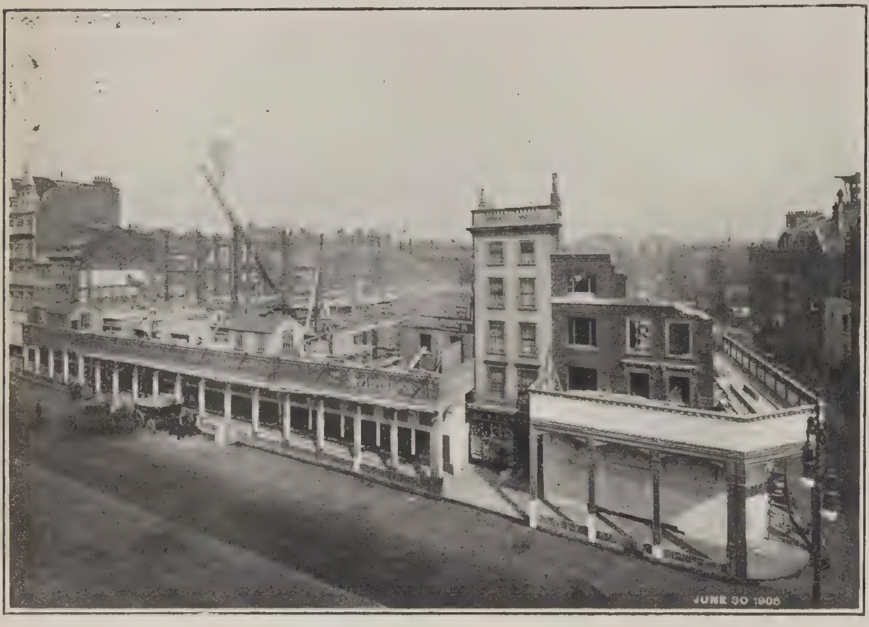

Fig. 4. View from Oxford Street.

the ground (in addition to the basement), and having about 20ft. frontage to Oxford Street. Fig. 4 shows a view of this building. The procedure was as follows:—

Temporary foundations were put in clear of the foundations for the new building, and were prepared for carrying large girders about 30ft. long, one on each side of the old walls, which girders would carry the needle beams through the walls of the old building; the needle beams being placed in the basement of the old building sufficiently high to permit the new foundations to be put in while the upper part of the old building remained perfectly undisturbed. As Mr. Selfridge got permission to pull down the old building before the foundations were completed, the scheme was not carried out.

The remarkable rapidity with which the building was erected may be observed from the successive photographic reproductions shown by figures 4 and 9, which were taken respectively on August 17th, 1908; and September 17th, 1908.

Steelwork.

The method of setting out the building and the placing of the columns has been dealt with in a former issue. It is further illustrated by Figs. 5, 6, and 7, which show part of the framing plans of the various floors.

One particular feature of this building is the regular and economic setting out. Practically all panels are alike, permitting a great deal of repetition work. The columns are spaced 22ft. to 24ft. centres. The floor girders are spaced 12ft. centres. There are no columns in the exterior walls; the loads are carried on blue-brick piers. An exception is made on the first floor plan (Fig. 5), where column 71 and 72 have been introduced for the purpose of underpinning the old building previously described. Beams 20in. deep have been extensively used. The method of showing the framing and working of the different parts is shown on the plans.

Every piece has a separate identification number, so that there should be no confusion during erection. The works of the columns are shown in a circle, and the work of beams and girders is shown in a bracket, thus: (122). In addition to this number, the piece is marked in the shop before leaving for shipment, while an additional work indicates for which floor the piece is required. For instance, Beam 122, in the 1st floor framing, is marked: I F L 122.

The levels of beams below floor level is given thus: [10ins.].

The design of the steelwork foundations and retaining walls has been made by the engeering department of Waring and White, Ltd. This firm has also carried out the erection of the steelwork, as well as the general contract. They have made their own shop drawings for the mill. Their supervision of the work from start to finish, and the adoption of a uniform method of working throughout, resulted in quick and good work at low cost. Every detail of the work has been standardised, and all work has been carried out systematically, in such a manner that responsibility could always be traced to the right person, and the progress of the work carefully watched.

In all, about 3,000 tons of steel has been erected, in addition to about 350 tons of bars for reinforced concrete work. The steelwork was erected at a rate of about 125 tons per week, and was completed in less than six months.

The number of drawings for the steelwork foundations and mechanical equipment was very large. These were prepared by Messrs. Waring and White. In all about 12,000 prints were made, of which about 2,500 were 40ins. by 27ins. Only by making complete drawings and preparing complete instructions could the work be carried out satisfactorily.

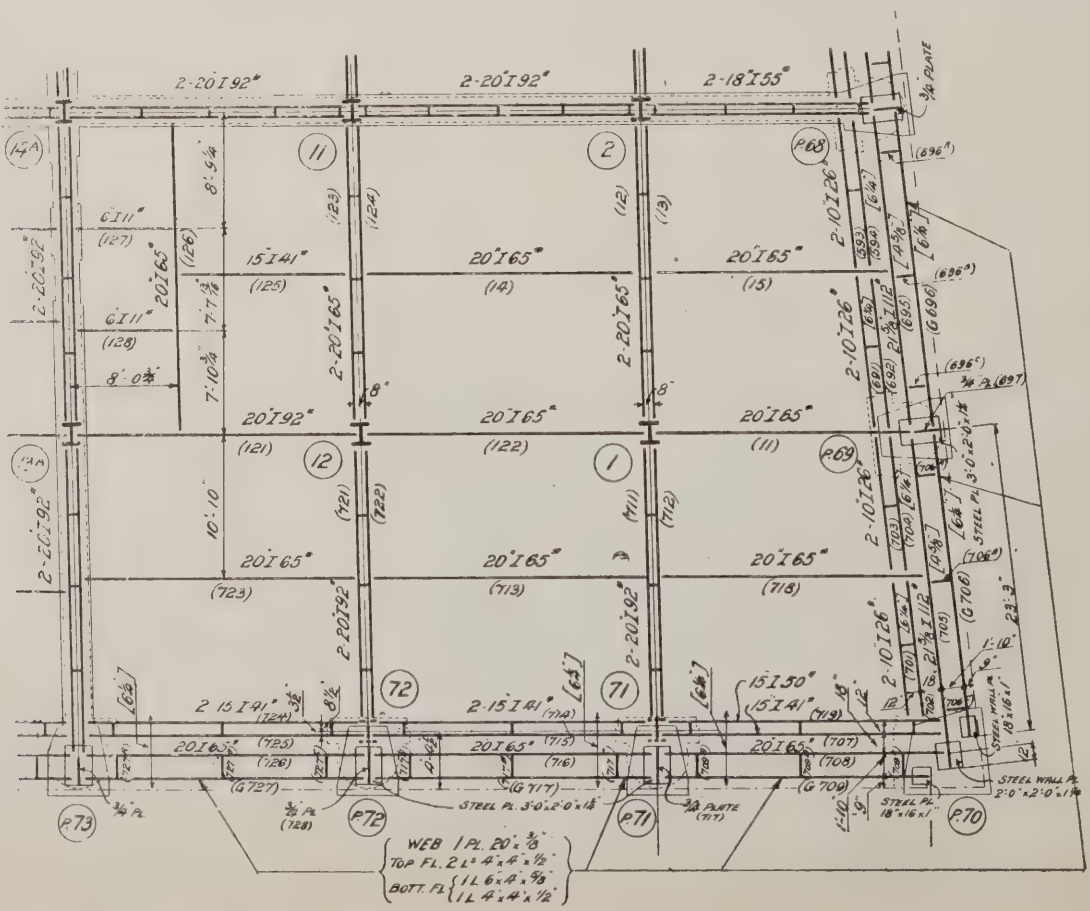

Fig. 5. Part of first floor framing plan

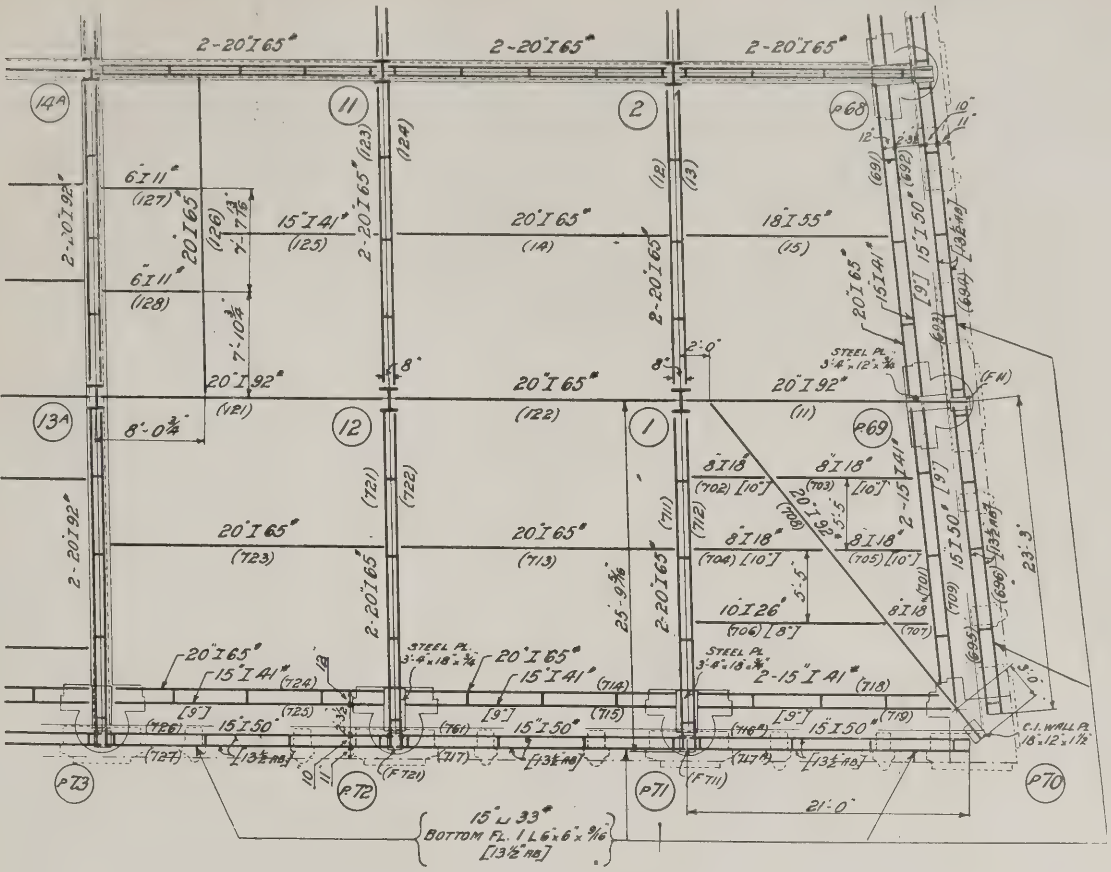

Fig. 6. Part of Fourth Floor Framing Plan.

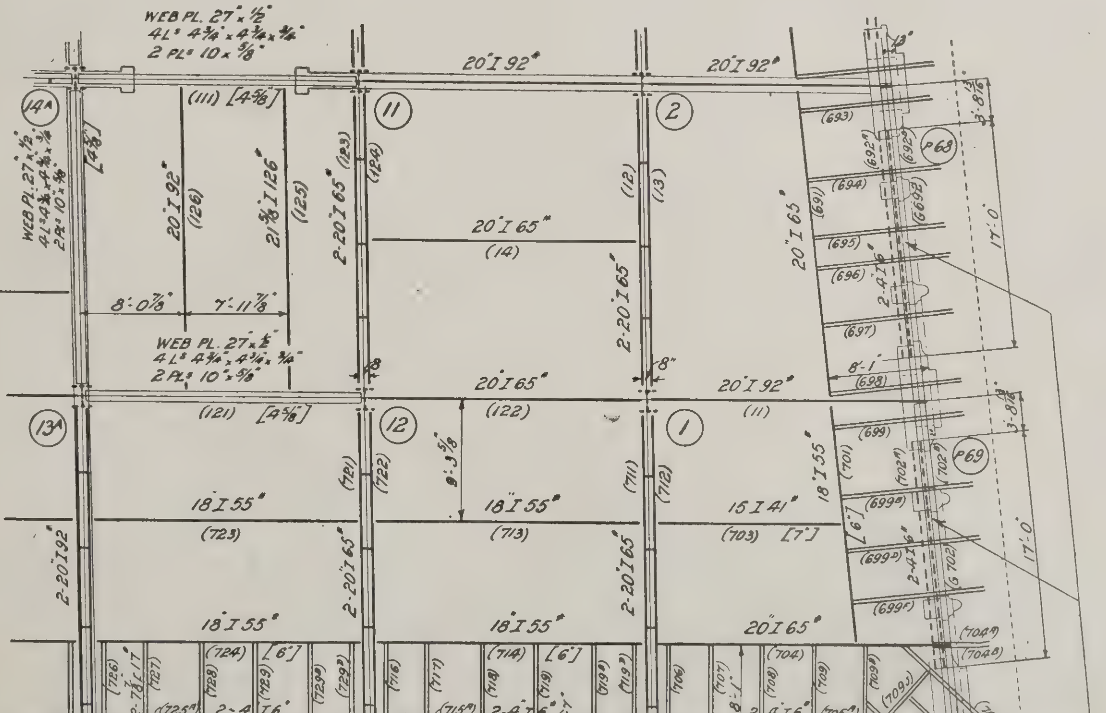

Fig. 7. Part of Roof Framing Plan.

THE SELFRIDGE STORES BUILDING, OXFORD STREET, LONDON.

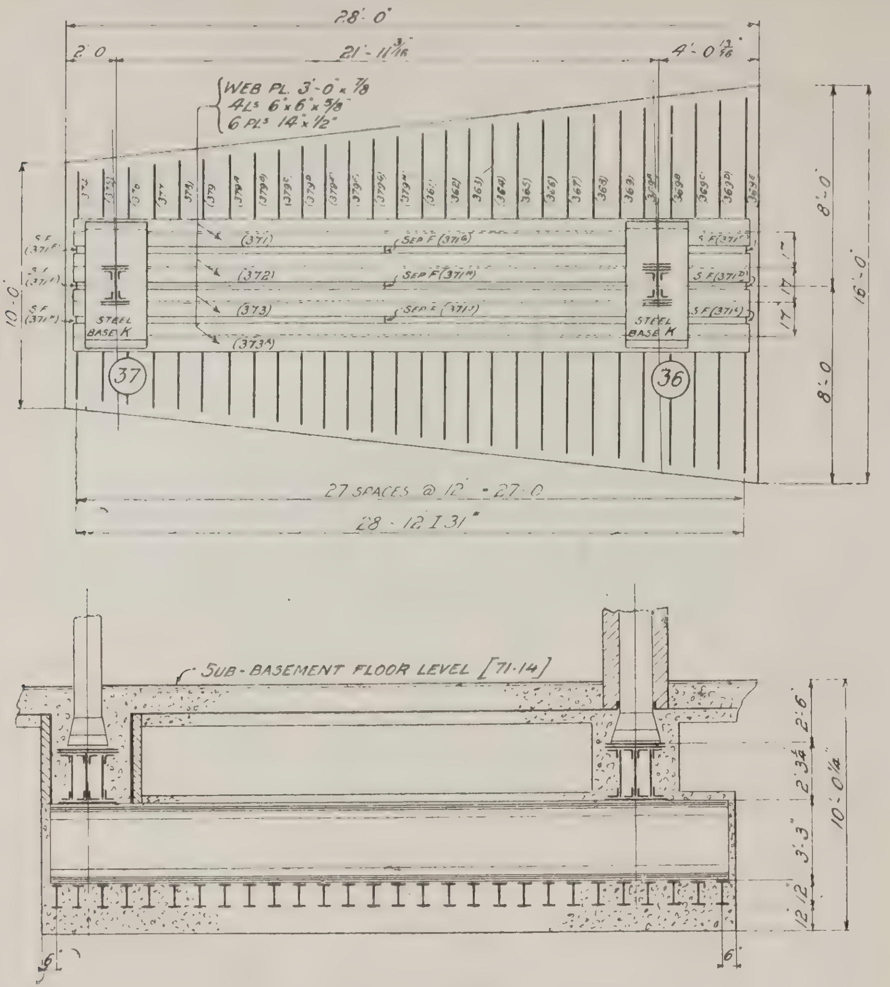

Fig. 8. Grillage for Cantilever Foundations.

Every steel piece was inspected in the shop, and compared with the detail shop drawings. The quality of all material was carefully tested, and the loading and transport were supervised. The finished material was marked as follows:—1, sign of approved material; 2, sign of approved workmanship; 3, identification numbers; 4, blow or melt number. Steelwork for different floors or different parts of the building was painted with distinguishing colours. The inspector was resident at the place of manufacture, and acted as the representative of the engineer.

The position of holes and lines of cutting, etc., was set out on the steel from the detail drawings, without the assistance of templates; and the different steel pieces were not fitted together in the shop, but were simply made to drawings, and were found to fit perfectly when erected.

The erection cranes for the steelwork on the site were supported on the steel frame, and raised from floor to floor as the erection proceeded. The tower gantry was not used.

Grillages.

The size of the foundations was so proportioned that the load was uniformly 5,000 lbs. per sq. ft. In some cases, on account of adjoining property, cantilever construction was adopted, as shown in Fig. 8. The shop detail for the plate-girder is shown in Fig. 1. These figures also show the method of dimensioning general drawings and details. Cast-iron bases were generally used under the columns.

Finishing Works.

It may be of interest to mention that the ceilings and walls are finished in plaster throughout, with the exception of the National, the Reading, the Rest, and the Writing Rooms, the last three being panelled in dark oak. The walls, generally, at present are tinted white. It affords some idea of the size of the building, when it is stated that Veronese, Ltd., of Fulham, S.W., supplied no less than 7 miles of 30-in. girt cornice to the building, and this large order was actually executed in 12 weeks, in order to assist Messrs. Waring and White, Ltd., to "break the record" in the erection of the building. The shop fixtures, counters, etc., are almost entirely in mahogany; but what will attract the attention of most visitors is the comparative low height of the fixtures. It is possible to see from end to end of the building, and needless to say the absence of high fixtures, combined with the white plaster walls and ceilings, gives an impression of lightness and brightness to the various floors in the building.

(*To be continued.*)

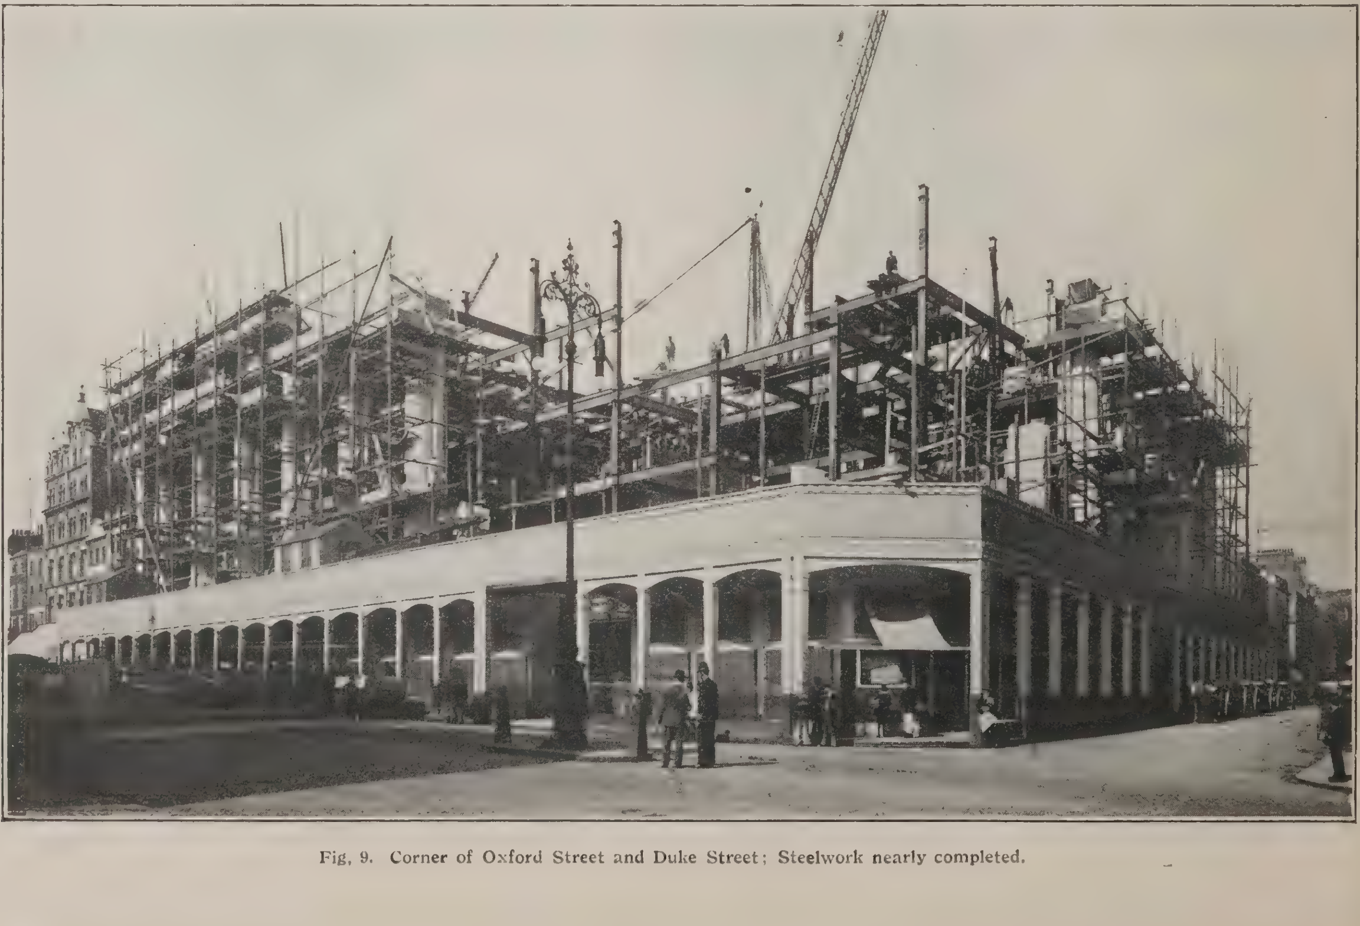

Fig. 9. Corner of Oxford Street and Duke Street; Steelwork nearly completed.

A HUGE TESTING MACHINE.

The recent collapse of the Quebec Bridge, and the serious weaknesses that have been discovered in the design of the Blackwell's Island Bridge, have not only made engineers in the United States fearful of the sufficiency of their practice, but have called attention to the want of data regarding the strength of structural members of large size. Engineers generally wish to have data from actual tests on full-sized members in order either to prove or to modify the current theory on the subject, as also to show what factors of safety are advisable in such large structures. In consequence of this demand for large-sized tests, the United States Government are constructing a testing machine of quite phenomenal size, capable of testing the largest units employed in steel structures that have been built in the United States. The machine is admirably designed as far as we can judge from the information available, and we would specially call attention to the fact that it is arranged vertically, as all machines for compression tests should be. The older type of horizontal testing machine is more economical and easier to work, but it has a great disadvantage in respect to the bending moment that is induced in the material by its own weight. Tests always should be conducted in the exact manner in which the members are intended to be used in practice, and horizontal compression tests do not conform to this requirement except in a few cases of bridge design. This American testing machine will provide the most valuable data, and we look forward with great interest to the tests it is proposed to conduct on it. The following is a short description of the machine.

The testing machine will be of 10,000,000lbs. capacity, and is now under construction by Jinius Olsen and Co., of Philadelphia, for the Structural Materials Testing Laboratories of the U.S. Geological Survey, under the direction of Mr. Richard L. Humphrey, engineer in charge of the laboratories. The machine was primarily acquired for the purpose of studying the effects of flaws and defects of various kinds in large blocks of natural stone, data on which were requested by the supervising architect of the U.S. Treasury Department. In order to meet a further request from the Supervising Architect for data relative to the strength of columns of brick, concrete, and structural steel, the original clearance between heads was increased from 25ft. to 65ft. Some idea of the great size of the machine may be gained from the accompanying illustration, in which has been sketched one of the chords of the Quebec Bridge, and also a larger chord which was used in the Blackwell's Island Bridge. The machine will be capable of testing built-up structures of even greater size than those shown.

The machine is a large hydraulic press, with one adjustable head, and a weighing system for recording the loads developed in it by means of a triple-plunger pump. It has a maximum clearance between heads of 65ft.; the clearance between screws is a trifle over 6ft., and the heads are 6ft. square. The extreme height above foundation is 80ft., and the gross weight over 200 tons.

The machine consists of a base containing the main cylinder with a sectional area of 2,000 sq. in., upon which rests the lower platform or head, which is provided with a ball and socket bearing. The upper head is adjustable through four vertical screws, 13½ins. in diameter, and 72ft. 2ins. long, by means of gearing operating four nuts with ball bearings. The shafting operating this mechanism is connected with a 15-h.p. 200-volt variable-speed motor, which operates the triple-plunger pump that supplies the pressure to the main cylinder.

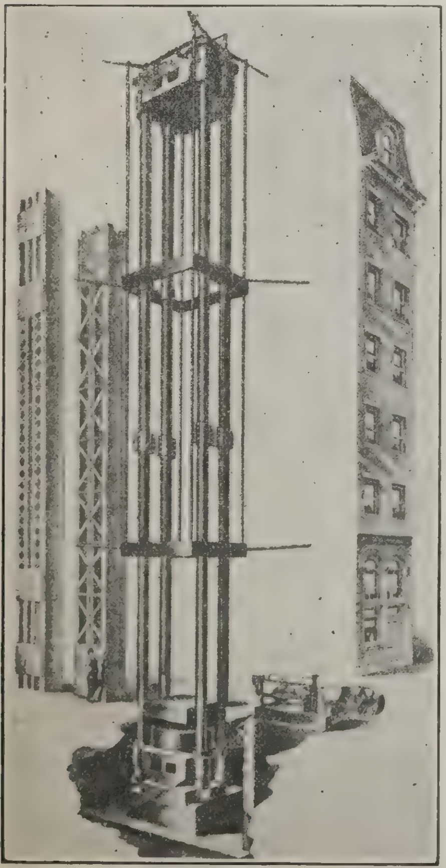
The weighing device consists of a set of standard Olsen levers, upon which is weighed 1-80 of the total load on the main cylinder. This reduction is effected through the medium of a piston and diaphragm. The main cylinder has a diameter of 50ins., and the smaller a diameter of 5 9-16ins. The weighing beam is balanced by an automatically operated poise weight, and is provided with a device for applying successive counter weights of 1,000,000lbs. each. Every division on the dial is equivalent to 100-lb. loads; smaller divisions are possible by means of an additional needle beam.

The extreme length of the main screws necessitates splicing, which is accomplished as follows: In the centre of the screws at the splice is a 3-in. threaded pin for the purpose of centering the upper and lower screws; this splice is strengthened by means of split sleeve nuts, which will facilitate the removal of the sleeve nuts whenever it becomes necessary to lower the upper head; after the head has passed the splice the sleeve nuts are replaced.

In order to maintain a constant load a needle valve has been provided, which will allow, when the pump is operated at its lowest speed, a sufficient quantity of oil to flow into the main cylinder to equalise whatever leakage there may be. The main cylinder will have a vertical movement of 24ins.

The speed of the machine for purposes of adjustment, using the gearing attached to the upper head, is 10ins. per minute. The speed for applying loads, controlled by the variable-speed motor driving the pump, will vary from the minimum of at least 1-60in. per minute, to a maximum of at least ½in. per minute. The contract provides that the machine shall have an accuracy of at least one-third of 1 per cent. for any load over 100,000lbs. up to the capacity of the machine.

The size of the machine may be judged from the weight of its principal parts. The castings for the base and the top head weigh approximately 50,000lbs. each, each main screw over 40,000lbs., the lower platform about 25,000lbs., and the main cylinder 16,000lbs. The top of the machine will be about 70ft. above the floor.



A GIANT TESTING MACHINE.

A THEATRE IN REINFORCED CONCRETE.

Details are given in the "Engineering News" (New York) of February 11th of a bold piece of construction in connection with a theatre and office building recently erected at Los Angeles, California. The most noticeable features in this edifice, which is built entirely of reinforced concrete, are the cantilever balconies in two tiers, and the three trusses across the auditorium. The roof beams have a span of 71ft. from wall to wall, and carry three floors of office buildings above them, all constructed in steel and concrete. The beams are 10ft. deep in the centre with horizontal chords. They are 24in. wide at top, 18in. wide at bottom, and are calculated to take a load of 375 tons. The steel reinforcement in the upper member consists of 12 1¾in. square twisted bars, with 15 1⅝in. square twisted bars in the bottom member. The largest cantilevers of the gallery and balcony are 27ft. and 30ft. in projection respectively; both of them have, therefore, the greatest known projection of any reinforced concrete cantilevers in existence. The balcony is supported by six of these cantilevers, giving a free overhanging of 30ft. The two side cantilevers are brackets 18ft. long coming off the truss columns on either side of the auditorium. The four great central cantilevers, two of which are 45ft. long, and two

THE MAJESTIC THEATRE BUILDING, LOS ANGELES.

51ft. long, project 29ft. and 31ft. respectively, and are supported on independent columns which are placed in the curtain wall between the main floor of the auditorium and the foyer. These cantilevers vary in section from 10in. wide to 12in. deep, at the outer end, to 18in. wide by 78in. deep at the maximum section, over the column support, and are reinforced with seven 1⅜in. square twisted steel bars on the tension side, extending through the anchor arm into the rear wall. On the compression side are three 1in. square twisted bars. Both the gallery and balcony were designed to sustain a superimposed load of 125lb. per square foot (the metal work at 20,000lb. per square inch, and the concrete at 500lb. per square inch). In the testing of the gallery a load of over 270lb. per square foot was placed directly over one cantilever, and the deflection at its end was only 3-16in. The maximum possible load with every chair occupied is estimated 50lb. per square foot, making no allowances for passages.

STANDARD SPECIFICATION FOR FERRO-CONCRETE.

A specification for works to be executed in reinforced concrete specifically intended for use as a standard for the Hennebique system, has recently been published by Messrs. L. G. Mouchel and Partners, of 38, Victoria Street, Westminster. This calls for no extended review on our part, for the specification is not of general application, though it offers many useful hints for the draughting of specifications for reinforced concrete generally. Many of the clauses are of an ordinary character required for the obtaining of good work. There are a few clauses, however, to which we may call special attention. First, the provision in the specification that the tender shall be a lump sum, is all very well if there are no extras and variations, but there are few jobs where there are no extras and variations. Then the contractor is required to obtain for himself all necessary measurements, levels, and information concerning the site of the works and the nature of the subsoil; furthermore, the contractor is to be held responsible for the accuracy and sufficiency in every respect of the working drawings, which he does not prepare. Surely the engineers responsible for the design should hold themselves responsible for its accuracy, and should supply the contractor with full information. The method of working proposed seems to us neither equitable nor politic. The proportions advocated for the concrete are approximately a 1 : 1⅘ : 3⅗ mixture for columns, beams, floors, and the like, the actual terms being 1 bag cement (224lbs.), 4½ cub. ft. sand, and 9 cub. ft. aggregate; and 1 : 1½ : 3 mixture for work in tidal waters and all piles, the actual terms being 1 bag cement (224lbs.), 3¾ cub. ft. sand, and 7½ cub. ft. aggregate. It is stated that in all cases where the weight of cement per bag is greater or less than 224lbs. the volume of sand and aggregate shall be varied proportionately; but, as the finer a cement is ground, the lighter it weighs, the contractor by such a clause is not encouraged to use a superior cement, for the superiority depends upon the fine grinding. Indeed, with a very finely ground cement a less quantity could be used, and the work would in no wise suffer. A clause is also inserted in this specification for load tests, stating that the load shall be 50 per cent. in excess of the nominal working super load, and how the load is to be applied. The test area for a secondary beam is required to be not greater in length than the distance between two main beams and not greater in width than the distance between two secondary beams, while the area for a main beam is to be not greater in one direction than the distance between any two supports of the main beam, and not greater in the other direction than the distance between two main beams. This is unsatisfactory, for by such a system of loading a considerable portion of the load is transmitted to the adjoining beams, and the actual load on the beam is much less than it appears to be.

REINFORCED CONCRETE SYSTEMS.

The Considere System.

M. Armand Considère is an authority of international repute upon reinforced concrete. When he was Inspector Général des Ponts et Chaussées, from which position he has now retired, he conducted most elaborate experimental and theoretical investigations into the principles and practice of reinforced concrete on behalf of the French Government. He had a large share in the work of the French Ministerial Commission on reinforced concrete. M. Considère has been largely responsible for the present theory which is generally adopted by designers in reforced concrete. His researches have been of the utmost importance, and had a far-reaching influence. M. Considère, after having retired from his official position, has entered the industry of reinforced concrete as a specialist designer, and it is with the Considère system, as comprising his ideas and methods of constructing in reinforced concrete, this article has to deal. We have before referred to his experimental researches, and we have published a communication from him in our columns on the subject of hooped or spirally reinforced concrete and its applications. That subject forms the most striking feature of the "Considère System," which is being worked in this country by the Considère Construction Co., Ltd., of 5, Victoria Street, Westminster, S.W.

M. Considère's discovery of the properties of spirally reinforced concrete date from 1902, when he conducted numerous experiments that showed the great efficiency of such means of reinforcing concrete members subjected to compression. He first communicated his discovery to the Académie des Sciences, in Paris, in notes on August 25th and September 6th of that year. Many experiments have been conducted to ascertain the properties of concrete hooped or spirally reinforced, in the laboratories of the Ecole des Ponts et Chaussées and the Conservatoire des Arts et Métiers at Paris, the Technical High Schools at Stuttgart, Turin and Zurich, and the Artillery Arsenal at Turin. The method of construction has received the official seal of the French Government, for in the instructions issued by the Minister of Public Works to the Engineers of the Department of Ponts et Chaussées, methods for the calculation of the dimensions of spirally reinforced members find a place. Since 1904 spiral reinforced concrete has been employed in many important works, notably in France, Switzerland, Austria, Germany, Belgium, and England.

The experiments conducted for the French Commission du Ciment Armé have shown by a comparison of exactly similar test pieces of concrete, plain, reinforced with longitudinals and ordinary bindings and spirally reinforced, that whereas with the ordinary bindings reinforced concrete gave extremely irregular results, the spirally reinforced was most regular, being unaffected apparently by considerable variations in the quality of the concrete and giving much higher resistances than the other; furthermore, they showed that eccentric loading diminished the resistance but little The formulæ for calculating the resistance were proved by experiments on large and small test pieces, and under varying conditions of execution and quality of material and workmanship, and varying dispositions of the reinforcement. Only a spiral hooping is theoretically necessary to gain maximum resistance, but longitudinal rods of small section are usually provided to convenience the work of construction. The spiral binding acts by resisting the outward bulging or bursting of the columns under load. Spirally reinforced concrete possesses great ductility and elasticity. The external shell of concrete covering the spirals begins to splinter if the pressure exceeds the crushing strength of plain concrete by 30 to 70 per cent., the resistance of the shell increasing according to the percentage of metal. Longitudinally reinforced concrete often *fails* at less than the resistance of plain concrete. The resistance furnished by longitudinal bars is proportional to the shortening they undergo before the concrete in which they are embedded begins to disintegrate; therefore their efficiency depends entirely upon the ductility of the concrete, which is small if the concrete is of poor quality. It follows that longitudinal reinforcing is of little effect in increasing the resistance where the concrete is of bad quality, and therefore most needs its assistance. Spirally reinforced concrete of the poorest quality is capable of undergoing a shortening 20 to 30 times greater than that necessary for producing in the longitudinal bars a resistance equal to their limit of elasticity. The nature of the increased resistance produced by the spirals is comparable to that of the well-known sand-boxes frequently used by contractors for supporting the centering of bridges; its cause is intermolecular friction, which is of identical value for mortar and concrete of any description as for sand; therefore its value is not materially affected by the quality of the mixture.

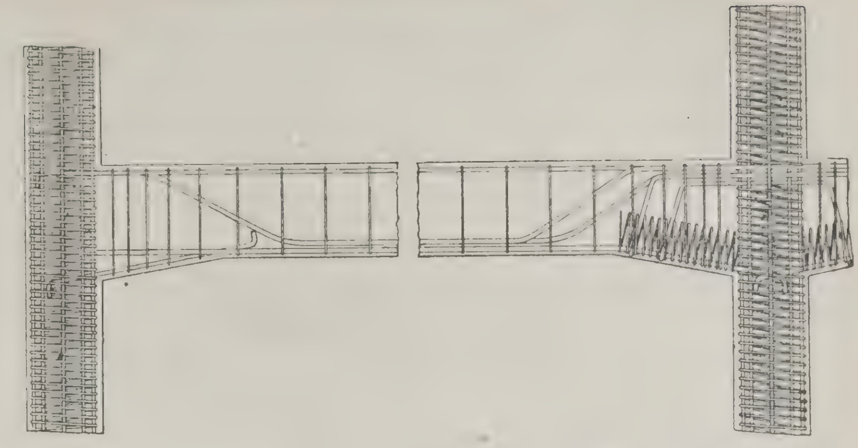

FIG I.—END BAY OF A CONTINUOUS GIRDER: CONSIDERE REINFORCEMENT.

M. Considère gives the following rule for the resistance to crushing of a spirally reinforced prism subjected to pressure at the ends:—

"The resistance exceeds the sum of the three following elements:—

"(1) The resistance to crushing of the concrete itself, increased by 50 per cent.

"(2) The resistance of the longitudinal reinforcement taken at its limit of elasticity.

"(3) The resistance of an imaginary longitudinal reinforcement, taken at its limit of elasticity, the weight of which would be 2.1 times the weight of the spiral reinforcement."

The French Ministerial regulations require in calculations the substituting of 15 volumes of concrete for one volume of longitudinal armouring, and 32 volumes of concrete for one volume of spirals. This means that the 50 per cent. increase in the constant resistance of the plain concrete is ignored. Then there is a further requirement that to avoid cracking of the envelope the pressure must not ex-

ceed 60 per cent. of the crushing resistance of plain concrete 90 days old. Thus the regulations provide for a greater factor of safety than is required for longitudinally reinforced pieces, which is manifestly the opposite of what should be allowed if we regard the superiority of spirally reinforced concrete in respect to its ductility and uniformity.

For further details of the theory of, and experiments on spirally reinforced concrete, the reader is referred to M. Considere's articles in former issues of this journal.

The principle has been applied by M. Considère to the reinforcement of parts subjected to compression in various structures and parts of structures. The advantages claimed for this are a saving in cost, a saving in bulk of material, and a reduction in dead-weight. If continuous girders are constructed in reinforced concrete, the negative bending moments over the supports are of great intensity, greatly exceeding the positive moments at the centres of the span. Moreover, whereas the centre of the beams can be made of T section, so providing a large area of concrete in compression over the supports, the beams are rectangular in section, and though increase of depth is obtained by making brackets overlapping the rods, even then the beams are weak. Therefore, we are accustomed to regard the beams as not truly continuous, and therefore to provide for a greater bending moment at the centre of the span and less over the supports than would be necessary with a truly continuous beam. The result is, the resistance over the supports is insufficient to prevent cracks occurring there, especially with heavily loaded floors of large spans. These are unsightly and objectionable, and, of course, if we do not take full advantage of continuity of action, we are led to increase of cost. M. Considère overcomes this difficulty by reinforcing the concrete in compression in continuous beams over supports by means of spirals, as shown in Fig. 1. It will also be noted that the top reinforcements are turned down to form shear members, and also to prevent them sliding in the concrete, which they might do when brought into tension, owing to their short length, if their ends were not anchored in this way.

M. Considère also uses spirals at the centre of the span in independent rectangular beams, to reduce their depth.

For fixed and continuous arches, spiral reinforcing is highly advantageous as resisting the great compressive stresses that may be induced without excessive size.

Fig. 1 shows the general use of spirals in beams and columns.

Fig. 2 shows their use for reinforcing piles. It is remarkable that the Considère piles can be driven without the imposition of a dolly of wood, and a cap of sand or sawdust, which is usually necessary to prevent shattering of the head of piles. Dollies and caps diminish the effect of the blows from a pile driver, and consequently increase the cost of driving, and retard the penetration. Considère piles are driven in an exactly similar manner to timber piles, and without any special appliances.

(*To be continued.*)

At a meeting of the Oldham Corporation Finance Committee, on March 18th, the town clerk read a letter from the Oldham and District Master Builders' Association protesting chiefly against the £500 penalty included in the fair contracts clause which the Finance Committee had under consideration. The letter pointed out that the amount was apparently the highest that any public body had proposed; that it was unreasonable and out of all proportion to the damage that would ensue upon any breach of the conditions; and that the amount of the penalty should be in each case determined by an independent arbitrator. The matter was held over for further consideration.

A NEW TEST FOR CONCRETE.*

By J. S. Owen, B.A., M.D., A.M.Inst.C.E. etc.

(*Concluded.*)

It appeared to the author that it would be interesting if some tests could also be made on hand-mixed concrete; as he has long been of the opinion that a perfectly uniform mixture is very seldom obtained by this method. Arrangements were therefore made to carry out a few tests of such concrete on works where mixing was done by hand. Seven such tests were made, all on works in or near London; in every case the concrete was carefully mixed, probably more carefully than usual in the first four cases, owing to the presence of the foreman or engineer for the works beside the banker; and the fact, which must have been obvious to the men, that some test was to be made. In the fifth test, however, the men were not aware that the concrete would be tested, as on the author's arrival he found a heap of concrete ready mixed for the work; it had been turned twice dry and twice wet, and from this samples were taken.

TABLE B.

Date. 1908.	No. of Test.	Proportions—Ballast, Sand, Cement.	Size of Sample. Cubic Inches.	Sand Layer in Inches.		Cement Layer in Inches.		Ratio: Sand Layer. / Cement „		Per Cent. of Variation of Cement.
				Tube 1.	Tube 2.	Tube 1.	Tube 2.	Tube 1.	Tube 2.	
Oct. 2	1	B } 5 S } C 1	6.25	1.20	1.30	2.40	2.50	0.50	0.52	4
Oct. 2	2	Ditto	6.25	1.30	1.20	2.20	1.90	0.59	0.63	7
Oct. 26	3	B 2 S 1 C ⅔	6.25	1.00	1.10	1.50	1.90	0.67	0.58	15
Oct. 26	4	Ditto	6.25	1.15	1.15	1.50	1.50	0.77	0.77	—
Oct. 28	5	B 4 S 2 C 1	4.21	1.10	1.00	1.30	0.95	0.85	1.05	24
Oct. 28	6	Ditto	4.21	0.97	1.05	0.90	1.12	1.08	0.94	15
Oct. 28	7	Ditto	4.21	0.95	1.20	1.05	1.55	0.90	0.77	17

The results are given in Table B. The glasses used for settlement were 13 inches high by 1½in. diameter.

It will be seen that uniformity of mixture was attained in only one case, although the concrete looked well mixed. This shows, not only the impossibility of determining when mixture is complete by eye alone, but also the difficulty of getting the best results with hand-mixed concrete. The effect of the human element in concrete made without close supervision, is that the variation in the amount of cement in different parts of the concrete was as much as 24 per cent. It is unnecessary to point out what this means, and the waste of material which it implies.

To summarise, the author hopes this test will be of value in enabling engineers to determine whether concrete is being properly mixed or not in any particular case; and in relation to mixing machines, to fix the time necessary for any machine to produce a proper mixture, and thus to determine its legitimate output of well mixed concrete.

The test is very simple, and can be applied, with a little practice, by any engineer. Each test occupies about 15 minutes, and the apparatus costs only a few shillings. Hence it may be regarded as a works test, which can be used wherever concrete is being mixed.

EARTHQUAKE-PROOF BUILDINGS.

The recent earthquakes in Italy have aroused vital interest in the subject in that country of erecting buildings proof against earthquake shock, and as the Messina, Kingston, and San Francisco earthquakes have aroused world-wide interest, we are preparing some instructive essays on the problem of the design of such structures by Italian engineers. We may mention also that an international competition has been arranged by the Lombard Co-operative Society of Public Works under the auspices of the College of Engineers and Architects of Milan, to determine types and methods of building to be adopted in those parts of Italy which are subject to earthquakes. Plans, reports, photographs, and models will be received by March 31st, and awards of £120, £80, and £40 are offered for the best proposals. The secretary's address is 8, Via Lupetta, Milan.

IMPORTED GRANITE AND JOINERY

The use of foreign granite at Rosyth has provoked a wordy warfare in Parliament, the Press, and among the people generally. A pile of cuttings beside us brings very forcibly to mind the fact that the question of Tariff Reform v. Free Trade is once more to the fore over this business; even the Labour representatives in Parliament have urged the view that it would be better to pay a little more for the granite, and ensure the employment of a large number of men at their proper trade, than establish costly relief works for the purpose of dealing with their want of employment. Mr. Dewar, while standing as candidate for the representation of South Edinburgh, was severely heckled over this question, and also over the question of imported joinery. He made the characteristic and logical reply that if joinery was made here—and made dearer—the house would be dearer and the rent more, and that while things were hard on the joiner, the whole community had to be considered. This reply, of course, conforms to the accepted doctrine that the consumer alone is worthy of consideration, and that the mania for cheapness is a thing to be encouraged. It is a view that operates hardly on the whole building trade, on both employers and employees; for the latter get little work, and the former little or no profit. The craze for the lowest tender, encouraged in Government offices, combined with the prevailing depression, is working havoc all round, and the whole thing moves in a vicious circle.

---

*Abstract of a paper read by J. S. Owen, B.A., M.D., A.M.Inst.C.E., etc., before the Society of Engineers, March 1st, 1909.

Federation News.

DEWSBURY ASSOCIATION.

Secretary: E. B. Warmsley.

The February meeting of the Dewsbury Association was held at the residence of Mr. Wm. Garforth, Ravens House, Dewsbury, Mr. Coop in the chair.

The report of the Yorkshire Federation January meeting was discussed.—Messrs. W. Airey and Son, contractors, Leeds, were admitted honorary members of the Association.—It was decided to invite the Yorkshire Federation to hold their monthly meeting in May at Dewsbury.—The members were afterwards entertained to supper by Mr. Garforth, to whom a hearty vote of thanks was accorded for his kind hospitality.

YORK ASSOCIATION.

Secretary: J. Hague, Solicitor.

The York Master Builders' and Contractors' Association held their annual dinner at the Windmill Hotel, York. The Lord Mayor of York (Ald. J. Birch) presided, and was supported by the Sheriff of York (Coun. E. Walker), Mr. W. S. Biscomb (vice-president), Mr. W. R. Thompson (Wednesbury, president of the Yorkshire Federation), Mr. A. W. Sinclair (Scarborough, past-president of the Yorkshire Federation), Mr. J. Davidson (Leeds), Mr. F. W. Spurr (City Surveyor), Mr. S. Needham, and Councillors Sharp (Mansfield), W. H. Birch, F. W. Birch, Hardgrave, Hopkins, Petty, Rickaby, and about 80 members and friends.

After the usual loyal toasts, Mr. Councillor G. Sharp submitted the "Yorkshire Federation." It was, in a sense, he said, the House of Lords of the building associations of the county. Under its guidance, branches had been formed in nearly every town in Yorkshire, and it was one of the largest sections linked with the National Federation. It was the pioneer of the great principle of conciliation, which was afterwards adopted and forwarded by the National Federation. The principle first saw the light in Yorkshire, and the first conference between masters and men took place in their own city of York. The Yorkshire Federation had done excellent work on the question of municipal trading, and their secretary's able pamphlet had proved that much money might have been saved by various corporations if the work undertaken had been carried out by private contractors. He was satisfied that, in the long run, they, as masters and large ratepayers, would come to the conclusion that the money they paid in rates was being used against them, and they would nip in the bud these enterprises as far as possible.

Mr. W. R. Thompson (president), in reply, drew the attention of his hearers to a recent legal decision, by which it had been held that a contractor was responsible for deficiencies in material or workmanship, if it could be proved that he knew they were unsuitable. He advised them, therefore, to draw the attention of the architect (in writing) to any case of unsuitability in materials or workmanship occurring in any future work in which they were engaged. He was glad to congratulate the local association on its strength, and he urged every member to take a deep personal interest in the work. He referred to the case in which a local member had sought the aid of the local association. The matter had been taken up by both the Yorkshire and National Federations, who would give all needful help and support.

Mr. A. W. Sinclair (past president) also replied. He knew of no association where the membership was so large in proportion to its population as that of York. He admired the way in which they bound themselves together, recognising that if they were to have an effective power behind them it would only be theirs in so far as all were united and welded themselves in a common brotherhood.

The Sheriff of York proposed "Success to the York Association," and congratulated them on having the chief magistrate as president, and on the number of members who were also on the City Council. It was such practical business men as they were who were most needed to guide the destinies of the city.

The Lord Mayor, in reply, thanked the members of the association for his election from the bottom of the ladder of membership to his present position. He expressed the pleasure he felt in the presence of the City Surveyor. It expressed the friendly relations which existed between them as contractors and the Corporation officials.

The Vice-President (Mr. W. E. Biscomb) also briefly replied, incidentally mentioning the importance of their trade, which employed more men in the City of York than any other section of trade, with the exception of the North Eastern Railway.

Mr. J. Davidson (Yorkshire Federation Secretary) proposed the "City and Trade of York." He referred to the great honour bestowed upon the association's president, not only by the citizens, but by those of his own calling. He went on to refer to the many ancient buildings to be found in the city, which bore eloquent testimony to the builders of the past, and which reminded present-day builders that they must look to their laurels if they were to emulate the performances of the old-world craftsmen. Referring to the Trades Disputes Bill and the Miners Eight Hours Bill, he said that the latter measure had been declared to be only a beginning, for the avowed aim and ambition of the Labour Party was to make the same conditions apply to every trade and industry in the Kingdom. Parliament legislated, but municipal corporations had often to adminster, with the frequent result, during late years, of further encroachment on members' time, and crushing additions to the rates. The unemployed problem was unfortunately being solved in certain quarters in such a way as to accentuate the difficulty; for in attempting to alleviate the prevalent depression many local authorities were entering into unnecessary and illegitimate competition with private traders. The result was increased cost and reduced efficiency, and also the increase of local indebtedness and reduced value of municipal loans. In the course of a few years large sums of money would have to be found for renewals and replacement of work done by unskilled labour, and in certain instances the cost of such work had been officially admitted to be from 30 to 50 per cent. in excess of what it would have been had the work been done by experienced contractors. In this way the working men were having greater burdens placed upon them, because the additional expenditure involved meant increase in the rates, as well as decrease in the efficiency of the work done. Simply on the basis of the theory "every man to his trade," was it not better in the public interest that this work should be put in the hands of skilled contractors, who were conversant with the wages and conditions under which the men should work, as well as what could reasonably be expected from each? It was notorious that workmen were prepared to carry out a greater measure of work for contractors than for public officials. Commenting upon the Right to Work Bill, the speaker said this, too, would, no doubt, place still greater work upon the shoulders of the corporations, and would take away a large amount of that personal responsibility which should rest on every man. He urged that, whilst municipalities controlled such descriptions of work as were admittedly public monopolies, they should leave trades and industries free to carry out their particular and familiar functions.

Mr. Councillor W. H. Birch replied.

Mr. Councillor Mansfield, J.P., proposed "The Architects and Surveyors," to which the City Surveyor and Mr. S. Needham replied, the latter commenting on the fact that in spite of the great depression in the building trade, no attempt had been made by the masters to reduce the wages of the operatives.

Mr. Councillor F. W. Birch shortly proposed "The Visitors," to which Mr. F. Pottage responded.

CHATHAM AND DISTRICT ASSOCIATION.

Secretary: Herbert Edmonds.

The tenth annual general meeting of the Chatham and District Association was held at the Masonic Hall, Chatham, the president (Mr. Alderman Charles Edward Skinner) in the chair.

The annual report and balance sheet having been received and unanimously adopted, the secretary reported that the membership had decreased—a state of things which should be seriously considered. No improvement in the building trades in the county can be reported, and locally the state of things is very bad, and as a consequence the association has suffered. The depression in trade has prevented the operatives making any demands, but probably it is only the lull before the storm, and when they see their opportunity they will not be slow in taking advantage of it; and it is therefore imperative that the association should be maintained in a state of efficiency.

Officers were re-elected for the ensuing year as follows: President, Mr. Alderman C. E. Skinner; vice-presidents, Mr. R. G. West (Messrs. West Bros.) and Mr. H. E. Phillips; treasurer, Mr. W. Darby (Messrs. J. Darby and Son); auditor, Mr. F. G. Luff; solicitor, Mr. A. Booth Hearn; secretary, Mr. Herbert Edmonds.

One new member was elected. The district comprises Chatham, Rochester, Stroud, Frindsbury, and Gillingham.

WAKEFIELD AND DISTRICT ASSOCIATION.

Secretary: J. Beaumont.

A meeting of the members of the Wakefield and District Association was held at the Strafford Arms Hotel, Wakefield, on March 4th, Mr. Tom Lee (president) in the chair.

A letter of sympathy was sent to Mr. Fallas, who was prevented by illness from attending.

A communication from the Yorkshire Federation asked for the views of the members of the association as to the National form of contract, and the secretary was directed to reply that the members could not suggest any alterations therein.

A similar communication dealing with the engagement of workmen, with a view to the provisions of the Workmen's Compensation Act, was also discussed, and the secretary was instructed to forward to secretary of the Federation certain suggestions.

On the proposition of Mr. Elvey, seconded by Mr. Sanderson, it was decided to hold the future meetings of the association at the Bull Hotel, Wakefield.

A cheque for £5 was signed and directed to be forwarded to the treasurer of the Yorkshire Federation on account of this year's subscriptions, on the motion of Alderman Judge, seconded by Mr. Sanderson.

Mr. Alfred Martin, joiner, Belle Vue, Wakefield, was elected a member of the association, on the proposition of Mr. Pashley, seconded by Mr. Crook.

MANCHESTER, SALFORD, AND DISTRICT ASSOCIATION.

Secretary: John Tomlison.

The number of members of the Manchester, Salford, and District Association is now 193.

The joiners' branch of this association met a deputation from the operatives' society to consider the employers' notices and operatives' counter-proposals for alterations to the working rules. Drafts of the amended rules *re* overtime, discharge notice, and grinding workmen's tools, drawn up in accordance with the Northern Centre Conciliation Board decision, were before the meeting and approved, subject to one or two slight amendments. These alterations have since been signed.

A lengthy discussion took place on the notices at present in hand for alterations to various rules, which have not yet been before the Conciliation Board, namely, the extension of the shorter working hours in winter, defining the district within which the rules are to apply, and the deletion of the walking time rule, the employers suggesting that travelling expenses be allowed in lieu of walking time.

The operatives agreed to lay the employers' views before their members, and to notify the employers of the result.

It was reported that the plasterers' and painters' branch of the association had been very active in the consideration of several important matters of trade interest. Meetings have been held with the manufacturers of patent plaster partitions, with a view to coming to some agreement as to the fixing and finishing of their plates, and a further meeting was arranged for March 16th.

The branch have also had under consideration the methods adopted by a certain firm of manufacturers in the sale of their materials, and a conference has been arranged with representatives of the firm with a view to arriving at some definite understanding thereon.

A case has been before the branch where an official of the operatives' society has lodged certain charges with an architect against one of the members with respect to a certain contract then in hand, and the matter was referred to the general committee, with a request that they deal with it as early as possible.

The monthly meeting of the general committee of the association was held at the Board-room, Blackfriars Street, in the following week, when the senior vice-president (Mr. S. Gerrard), in the absence of the president, presided over a well-attended meeting.

Eight new members were elected into the association.

Copies of the clauses contained in the Manchester Corporation Bill now before Parliament, in which they were seeking to obtain powers to control the new methods of building construction, such as iron, steel, and reinforced concrete, were considered, and after giving the same full consideration, it was decided not to oppose the clauses.

A special meeting of the committee was held a fortnight later, to consider the case of a member of the plasterers' and painters' branch, where the operatives had lodged certain charges against him with the architect regarding a contract he was then executing (referred to above). After hearing explanations from the secretary and the member concerned, and giving the same full consideration, a deputation was appointed to lay the case before counsel.

A vote of condolence and sympathy was passed with the wife and family of the late Mr. J. B. Peace, of the firm of Messrs. Peace and Norquoy, Ltd.

WORCESTER AND DISTRICT ASSOCIATION.

Secretary: W. Phelps.

The annual meeting of the Worcester and District Association was held at the Star Hotel, and was fairly well attended by the local members, though we should have welcomed the Malvern members.

The report mentioned the satisfactory working of the Conciliation Board, and included a strong recommendation to all to become subscribers to the "Builders' Journal," as well for its usefulness as a trade medium as for its standing as the official organ of the National Federation. The combined insurance scheme with the Law Car Co., with its low premiums and its promptness in meeting claims, was commended.

The balance-sheet showed a gain of £9 10s. on the year's working.

It was decided to hold meetings bi-monthly, and special meetings when necessary.

Mr. J. Stokes was re-elected president and Mr. J. J. Wood vice-president and representative to the Midland Executive Council; Mr. H. J. Probert, treasurer; and Mr. A. H. Constance and Mr. C. F. Brown auditors.

HULL ASSOCIATION.

Hon. Secretary: A. Peers.

The monthly meeting of the Hull Association was held at the Builders' Exchange, on Wednesday evening, March 10th. The president, Mr. E. Quibell, occupied the chair, and was supported by a good attendance of the members. Reference was made to the recent decease of Mr. Thomas Goates, of 39, Brunswick Avenue, Hull. Mr. Goates was one of the oldest builders in Hull, and had won general respect. The members unanimously resolved that a letter of condolence be sent to the family.

A report of the recent whist drive in connection with the association showed the satisfactory result of a profit of £2 6s.

Mr. W. Clarke, plumber, was formally initiated as a member into the association.

Suggested amendments for the National contract agreement (as requested by the Yorkshire Federation) were submitted by a sub-committee, and approved of. Mr. J. Davidson (secretary of the Yorkshire Federation) addressed the meeting on the necessity of strong trade organisations, and also on the Federation insurance scheme. The many advantages and benefits of workmen's insurance under Lloyds were dealt with, and it was shown that further advantages would accrue as a greater number of members took it up. In the discussion, a considerable number of questions were asked, and were ably replied to by Mr. Davidson. It is hoped that, as a result of the meeting, other members will decide to support the scheme when their present policies expire. A hearty vote of thanks was accorded Mr. Davidson for attending the meeting and speaking upon these interesting and important matters. Owing to the lateness of the hour, the remaining matters on the agenda were deferred until the next meeting.

Coming Events.

Thursday, April 1.

Leicester and Leicestershire Society of Architects.—Mr. W. K. Bedingfield on "The Architectural Possibilities of Reinforced Concrete."

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 1. DUNDEE.—Alterations at No. 61, Reform Street, and fittings for town clerk's office. Particulars at the office of Jas. Thomson, city architect, 91, Commercial Street, Dundee. Tenders with Wm. H. Blyth Martin, town clerk, city chambers, Dundee, by April 1.

April 1. WINDERMERE.—Erection of new premises in Crescent Road, Windermere, for the Bank of Liverpool, Ltd. Plans and specifications, and bills of quantities, at the offices of Walker, Carter, and Walker, architects, Windermere. Tenders, endorsed "New Bank Premises," to be delivered to the architects by first post on April 1.

The National Theatre.

The munificent gift, by an anonymous donor, of £70,000 towards the movement for erecting and endowing a National Theatre as a memorial to Shakespeare was announced by the Lord Mayor, at a meeting of the general committee held at the Mansion House on March 23rd. Literature and art were well and worthily represented at this meeting, and the executive committee's main recommendation, to the effect that the proposal to proceed with the erection of a theatre was a practicable and desirable one, was carried with what, in the circumstances, amounted to almost unprecedented unanimity. Although it is estimated that no less a sum than half a million sterling will be required for the construction, equipment, and endowment of a suitable building, yet the movement for the establishment of a National Shakespeare Theatre may now be regarded with some measure of confidence as being on the high road to success. For when so popular a scheme as the one now under discussion has assumed tangible shape, there is little doubt that a liberal and ready response will be made to the committee's appeal for funds. Thus full, if somewhat tardy, justice will be done to the memory of the patriotic poet whose passionate love for his native land—that "precious stone set in a silver sea"—has, in perhaps no less measure than his mighty genius, endeared him for all time to English-speaking people. Lord Lytton expressed the hope that the £500,000 required would be forthcoming to enable the theatre to be built and endowed in time for the Shakespeare Tercentenary in 1916, and other speakers took a still more encouraging and sanguine anticipatory view with respect to the immediate success of the scheme. Probably the majority of our readers will agree with us in thinking that, on the whole, the best and wisest choice has been made by the committee in determining that the National Shakespeare Memorial shall comprise a building primarily intended to enable the poet's fellow-countrymen to enjoy "the infinite variety" of his writings. Presented, with the extraneous assistance of artistic accessories, by the best exponents of histrionic art, and with a scholarly appreciation of Shakespeare's aims and intentions, the value of which it would be impossible to over-estimate, the poet's art, the philosopher's wisdom, the humourist's wit—in fact the *universality* of the genius of Shakespeare—should be turned to good account in a theatre from which the spirit of commercialism will be absent. We can but congratulate the committee upon the happy choice it has made in the form of the memorial to our national poet. But our appreciation of Shakespeare's mighty genius must find expression in a suitable building. It might appear to some of Shakespeare's admirers that, at least externally, the National Theatre should recall in some measure the picturesque aspect, the long mullioned windows, projecting bays, and high-pitched roofs of late Elizabethian architecture. But as a revival of that period of art has been tried already and found wanting, we may reasonably expect to find the Shakespeare Memorial Theatre clad in the semblance of the *real* Renaissance. In that event, provided the approved design is tolerably free from that incongruous mixture of elements due to the fancy (not to the scholarship) of their designers, which is the bane of most modern work, we shall not be disposed to take exception to the architectural style selected. We sincerely trust, however, that the committee will be sufficiently well advised to insist upon a less offensive scheme of internal decorative treatment than that usually associated with theatrical buildings in this country.

"Mad on Flat Roofs."

Birmingham Education Committee has had what a local paper calls "an amusing discussion" on the flat roof question. Presumably the amusement was relative rather than absolute, dependent on environment rather than on inherent quality—like a joke from his Lordship on the Bench; for in cold print the fun seems to have evaporated from the passages obligingly marked ("Laughter"). Mr. Bethune Baker proposed that in the plan for a new school in Sladefield Road, a flat concrete roof should be substituted for a slate one. A flat roof on the Oldknow Road Schools, he said, had been found cheaper than slate in the upkeep. Councillor Manton "had the strongest objection to this innovation. There was a tendency to go mad on flat roofs just now (laughter)." The ambiguity of the phrase seems hardly to excuse the laughter. Perhaps some sly local allusion was implied. Councillor Titterton said "it seemed to him the drawings were intended for a lunatic asylum (laughter). He hoped the chairman of the sites and buildings would withdraw the plans and have something more eyeable. (laughter)." Was this laughter ironical, excited by the Councillor's verbal coinage? The Lord Mayor said that if, as Mr. Manton had declared, there was a tendency for people to go mad on flat roofs, he (the Lord Mayor) trusted that, if they did erect one, steps would be taken to see that no one had access to it (laughter)." Mr. Manton, since the Lord Mayor was playfully disposed "to try confusions with him," might justly have retorted with the not impertinent question, "What steps?" which joyously recalls a merry moment in this year's A.A. play: "Pro: What steps did you have to take to obtain these—er—refinements?—Foreman: Well, we 'ad to take the front steps and do orl sorts of funny things with 'em." These figurative expressions put a premium on frivolity. The Lord Mayor thought that the "madness" might be fittingly retorted on "those people who believed no roof could be satisfactory that was not a steep one. For years he suffered from that frightful delusion, but he had now discovered that the steep roof accumulated snow until it became positively dangerous, and then shot it down on to the roof of the greenhouse and made a large hole in it (laughter)." Was this unholy laughter, excited by the Lord Mayor's misfortune, or by the glazier's opportunity? The Lord Mayor suggested that the reason why our ancestors did not build concrete roofs was because they had not material of the proper character. If that was only one reason out of many, it was nevertheless as cogent as the twenty-fifth reason urged by the naval officer for failing to fire a salute—he had no powder. The recommendation to put in a flat roof was adopted by twelve votes to eight, five members remaining neutral. The kind of roof adopted for the Sladefield Road School is without general interest *per se*. But it is instructive to show, by occasional typical examples, in what manner and in what spirit such matters are discussed by local authorities, as well as to note their decisions, which may occasionally mark the trend of the movement in building.

Einkuechenhauser.

New housing developments in Germany are worth watching. A few weeks ago we published an illustrated account of a sort of cooperative shop-keeping system in which, in a specially constructed building, many traders have agreed to pool the common services, such as clerical work, despatching of goods, and other matters that are usually managed independently, and consequently much less economically and with less efficiency than is developed with concentration. The theory seems excellent, though whether the practice will justify sanguine expectation, depends on the extent to which the participants are able to suppress the little human weaknesses that make for disruption. The same observation applies to the central cooking-house arrangement that is reported to be in course of extensive adoption on the outskirts of Berlin. The huge apartment hotels of New York have perhaps suggested the German experiment; but whereas in the apartment hotel the residents dine in a common restaurant, the occupants of the Einkuechenhaus of Berlin may take their meals in their own rooms, but will receive them from a central kitchen. The most up-to-date flat-houses of this type, however, are stated by a Berlin correspondent of the "Westminster Gazette" to "combine the flat carried to the extreme of convenience, the popular restaurant, the social club, and even the kindergarten school." Most of the flats have small kitchens for emergency use; but the idea is to do away with private housekeeping as far as table-supply is concerned, and incidentally with the private cook and her retinue, and with the necessity for "marketing." The average flat, we are told, costs £15 per room. It is gratifying to learn that these Einkuechenhauser are being tastefully built, with an avoidance of the meretricious ornamentation that disfigures the general run of Berlin dwellings. The system of common kitchens may perhaps commend itself to a small section of the community in Britain; but it is no more likely to become extensively adopted than is the system of common counting-houses and despatch departments. Britons are too individualistic or independent of temperament to combine amicably in schemes that would sometimes, it may be supposed, require more "give-and-take" than we are accustomed to exhibit either in domestic or in business relationship. It is for this reason that flats are going out of favour in this country; where the common-kitchen system is hardly likely to restore their vogue.

Apotheosis of Carving. Mr. Bertram Mackennal, A.R.A., has attained to the highest distinction that it is in the power of his fellow-commoners to bestow. They have held a dinner in his honour. It will be remembered that in January last he was elected an Associate of the Royal Academy, when Mr. John Belcher and Mr. Goscombe John were elected R.A.'s. Mr. Mackennal was born in Melbourne forty-four years ago, and is said to be the first Australian sculptor to win the distinction of an Associateship. It was his Australian compatriots who arranged the dinner, but this was a mere accident. As Mr. Mackennal himself gently reminded his hosts, in acknowledging the fine eulogy pronounced by Lord Tennyson, as chairman, art is cosmopolitan. Mr. Mackennal's career illustrates this proposition. He began his studies in his native city, continued them in Paris, and is maturing them at St. John's Wood, even there, where artists most do congregate. It may be that he has still to do his best work; but already he has given us so many good things—notable among them being the war memorial at Islington, the allegorical group on the Government buildings at Westminster, the Rodinesque "Circe," and the noble bust of Sir William Howard Russell in the crypt of St. Paul's Cathedral—as to justify very amply the Academical distinction and the dinner.

BATH AND BURY.

Our remarks in last week's issue on the threatened mutilation of Bath Street, Bath, were not, it seems, sufficiently emphatic. At least, we have received a mild and courteous remonstrance which seems to convey that imputation. Yet we think that, while it is certainly true that we endeavoured to give a fair presentment of both sides of the question, we made it quite clear that in our opinion the protest against the proposed demolition is well grounded in reason, and that on this subject we are most decidedly in agreement with Mr. Ernest George, Sir Aston Webb, Mr. Reginald Blomfield, and Mr. Mervyn Macartney. The last-named gentleman has made the very apt and opportune observation that: "At the present juncture, when the attention of the Local Government Board is being drawn to the necessity of comprehensive and sane Town Planning, when the public is slowly awakening to the possibilities of civic architecture, when architects themselves are tentatively advocating the necessity of a return to our traditional Palladian architecture to improve our streets, it is a curiously inopportune moment to inaugurate schemes tending to the destruction of monuments in this style. And almost alone in this country, Bath possesses elements of great style in its planning, which make it the finest model for all those interested in town planning." With the gist of this eloquent plea we are in the most hearty agreement. Also we find ourselves in sympathy with the citizens of Bury St. Edmunds, who have petitioned against the Corporation's intention to destroy certain characteristic features of their town hall. The elevation is decorated on the east and west sides with urns or vases in niches, which are strongly characteristic of the treatment beloved of the brothers Adam, who designed the hall. These it is proposed to remove, in order that windows may be inserted. It seems, however, that the requisite light can be obtained without interference with the vases, and we have therefore the less hesitation in regarding this as another instance in which, as in the case of Bath, the protest is rational and architectural rather than perfervidly archæological, and that it is therefore worthy of all the support we can give it.

The annual congress of the Central Society of French Architects is announced to take place in June next from the 21st to the 26th.

Our Edition de Luxe Building Trades Exhibition number will be published on April 21st. Further particulars will be announced next week.

* * *

Prof. Henry Adams, M.Inst.C.E., etc., of 60, Queen Victoria Street, London, E.C., has taken his eldest son, Mr. Henry Charles Adams, A.M.I.C.E., A.M.I.M.E., A.M.I.E.E., etc., into partnership with him in his practice as a consulting engineer and surveyor, under the style of Henry Adams and Son, at the above address, their Birmingham office being at 1, Waterloo Street. After serving articles to his father some eighteen years ago, Mr. Henry C. Adams migrated to Birmingham, where he was engaged as a special engineering assistant in the service of the corporation of that city, and in various other public and private appointments.

* * *

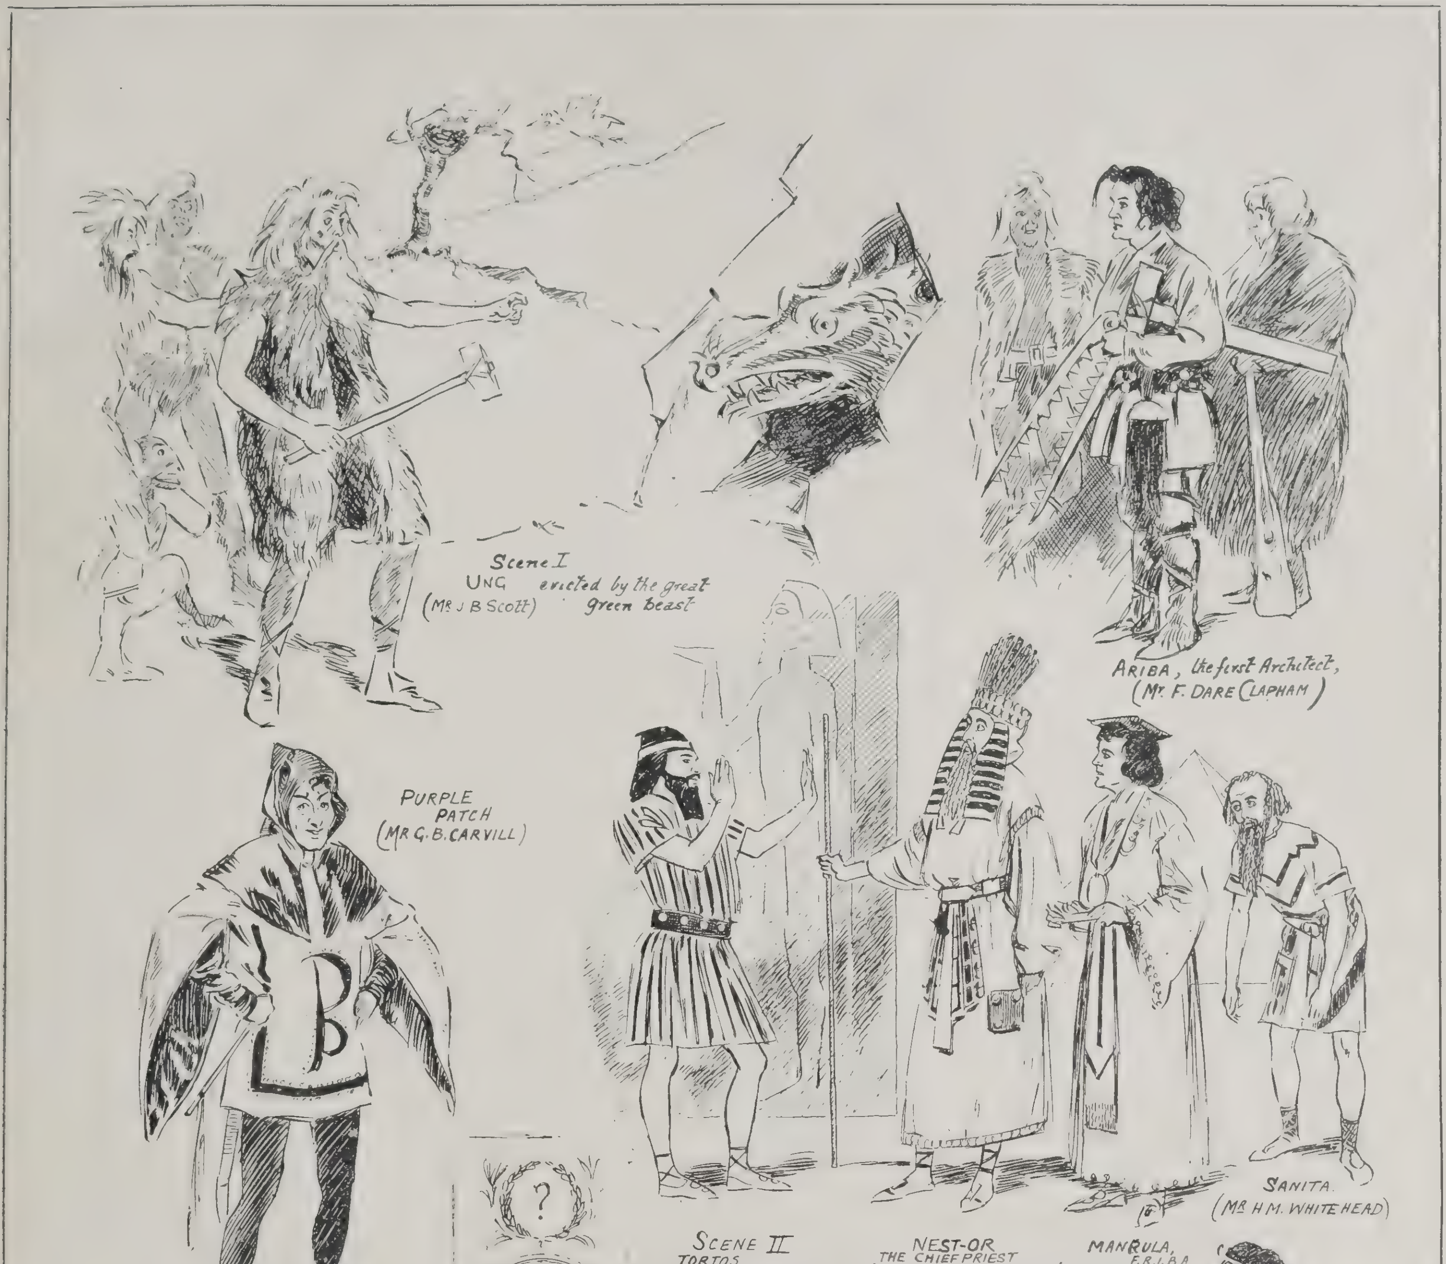
The type of barracks or temporary dwellings adopted in Italy by the Ministry of Public Works, for the accommodation of those whose homes were destroyed in the earthquake, is a wooden house of 4 mètres by 8 mètres, with a brickwork kitchen annexe, measuring 3 mètres by 1.90 mètres. The walls and the roofs are of double or cavity character, the former resting on brickwork 50 centimetres thick and 70 centimetres high. Each house, and each annexe, is divided longitudinally by a partition into two apartments of equal size, and to each house there are two doors and two windows at the front, with two roof lights to the annexe. The roofs are covered with sheet-iron and tiles.

THE A.A. PLAY: A MODERN "MORALITY."

It is the natural ambition of every architect to see his imaginings materialise in three dimensions. That were surely a sufficient excuse, if any were needed, for the annual production of an A.A. play; and the apology prefixed to the book of the words of this year's play—"Once more we have to apologise for inflicting upon our readers another violation of the Dramatic Unities"—may pass for an urbane convention. The play was altogether delightful, and was stupendously successful. It was, of course, intensely topical. The "devastating epidemic of Pageants" suggested the ground-plan. In the prologue, sung by Mr. G. Carvill ("discovered sitting on a rock pensively playing on the pan-pipes"), the superstructure is summarily described: "As I take you through the ages, turning over history's pages, Every age seems very similar to this; Builders' contracts never paid, lady clients all upbraid, And we sometimes make our 'mark' through a 'miss.' In the Future, and the Present, and the Past, Essentials all are very much the same; Yet if life's a ball worth rolling, It's at any rate consoling To know that other people knew the troubles of the game! In Act I. we show that 'Art' isn't wanted at the start, Simply 'Cheek!' Then, as Art becomes a fact, we require a little 'Tact'—Just a streak. But when Art its summit reaches, true 'Forbearance' great it preaches: Act II. will show you symptoms of its wane. Dilettateism spread—in Scene V. our Art is dead; Try 'Advertisement.'"

The play opens with a chorus of apes and prehistoric men. Ung is a neolithic evicted tenant, who, driven from his cave dwelling by a great green monster, is in miserable plight. "Where we're to sleep, I'm blessed if I know. Not a casual ward for miles! Oh for the merry and Poplar days of good King Edward and the palatial workhouse!" The apes point to the tree as offering a solution of the difficulty, and Ung thinks this a good idea. His son Boo, however, chides severely this momentary weakness: "Papa, I protest. You forget your descent—the Descent of Man. From that tree we sprang down to the ground; and assumed a position in society—an upright position." Papa continues to yearn for "Letchworth and the simple life," and says to Boo: "As for you, I'm almost tempted to call you a snob." Boo admits the soft impeachment, and glories in the accusation. Snobbery is his distinctively human characteristic. "Papa, when you left that tree you were yourself a snob; when grandfather Missing-Link insisted on starting life without a tail he was a snob." Presently there enters Ari-Ba "hung about with prehistoric tools of an architectural character," and displaying an ingratiating smile. He explains that the tools fell at his feet from the skies, and he hasn't the foggiest idea what to do with them. Purple Patch, the dæmon of the play, had told Ari-Ba that the Gods had decided to found a new profession, or art, as all the others were so overcrowded. When Ari-Ba makes his confession of complete ignorance, Purple Patch gives him this moral advice: "Don't give away your ignorance. Cheek is what you want at the start. Many an architect has started with less knowledge than you." He gives Ari-Ba "a valuable work of reference" which may help him in his career; and Ari-Ba, having read merely the title, "How to Treat a Client for a Shilling," puffs out his chest and declares that as the first architect he is prepared to build the first house. It is built forthwith, on the stage; Ari-Ba remarking of the design: "I have used considerable restraint in this, Mr. Ung. You will observe that the merits of the design, such as they are, rest upon a simple use of the plainest materials, with a careful consideration of the general masses." These prehistoric platitudes captured the prehistoric client.

The second scene is Egyptian. Time, in the reign of Queen Hatezu, of the ⅛ scale



THE ARCHITECTURAL ASSOCIATION AT PLAY. SKETCHES BY OUR SPECIAL ARTIST AT THE PRODUCTION OF THE "RISE AND FALL OF ARCHITECTURE."

dynasty, 1909 B.C., who having risen to the throne "on the crest of the wave of the new and the powerful feminine party, Would build a fair temple to Christabel, yea, and to all of the Pankhursts." The Ari-Ba of the first scene has now become Manrula, who finds the queen a very difficult client. What to do? Again the advice of Purple Patch is given: "For those but newly entering on their career, An impudence quite imperturbable is right; But having reached to some estate, 'tis different then. . . What you require is TACT." That's "a quality which all of us require, Without which you may easily be wrecked; 'Tis useful to a monarch or a coster, But it's very vital to the Architect." Manrula is to build the temple without paying any regard to the vagaries of the queen, who is to be tactfully persuaded that she herself is nevertheless the author and finisher of this beautiful building.

In Scene III. we are at the Greek period. Pericles is presiding at an arbitration court on the Acropolis. He explains the situation in a song: "My builder and the Architects, The men who built the Parthenon, Have lately had a horrid row—That's why we all are here just now. Oh, botheration! They actually have thrust on me A beastly Arbitration." Manrula has now become Callicrates, P.R.I.B.A., with a partner, Ictinus, "bit of an outsider, you know, and no feeling for art, but very useful." The sum of 30,000 drachmæ is claimed from Bryx, the builder of the Parthenon, under the penalty clause for delay. It was also complained that the building was not up to specification. There was trouble about the sculpture. Phideas was called as a witnesss, and sworn to tell the naked truth. Witness alleged that the figures were all fit when they left his studio, but the builder had cut them down. The builder sprang up protesting, "I had to cut them down. I'm a respectable tradesman and a married man. They were simply scandalous." Phideas: "Scandalous, indeed! You ought to have seen the ones I did for the Temple of Aesculapius!" —a cunningly insinuated topical allusion that brought the house down. Counsel explains the nature of the builder's counterclaim. It was "for extra work involved owing to the apparently unnecessary refinements on which the Architect insisted: columns out of plumb, all straight lines worked to curves, the building narrower at the top than at the bottom by 3·272 digits. Details, my lud, not even mentioned in the specification." But after the very funny evidence of the clerk of the works, the builder's foreman, and two expert witnesses, has been heard, and when things have been twisted into a rather bad tangle, enter again the deus ex machina, Purple Patch, who says: "It is natural, O Callicrates, for you to thirst for the builder's blood, but oh! be content to bleed your client instead. But even as I counselled impudence when your practice began, as I counselled tact as it grew, now I would remind you, in the plenitude of your power, that you can afford to be merciful, even to the point of kind words at prize-givings, and the voicing of high ideals to students." The builder's excuse for the delay is that while the work was in progress (or ought to have been), he was courting, and his sweetheart "chatted on the scaffolding the whole day long. . . Each day seemed shorter than the day before—My work grew less as my love grew more." The judge adjourns the court in order that he may have an opportunity of seeing the girl.

Act II., Scene I, introduces us to the Middle Ages, with an abbey a-building, and the Abbot (our old friend Ari-Ba, now Sir Thomas de Tufton), as architect. Unemployables complain bitterly of the importation of foreign workmen. Citizens complain that the rising tower is infringing their rights of light and air. An urban district surveyor serves injunctions, but is appeased by the auro-concrete method, as suggested by Purple Patch. Scene 2 shows us Joseph Addison at his wit's end for a subject for the next number of the "Spectator." Having exhausted all other forms of foolishness, he decides on Architecture, but is soon at a loss for ideas. To him comes Purple Patch. This delightful scene ends with a song by Addison, bewailing the unrequited toil of the architect's ghost.

In the last scene of all this strange eventful history, Ari-Ba has become Snatchall, competing for a £500 cottage in the "D.M." competition for an Ideal Home. He finds that his designs are being pirated by a Scotchman, who dances a reel and sings a song both in the manner of Mr. Harry Lauder. There is a good deal of good-humoured satire on practice, malpractice, and personalities of to-day. Purple Patch's advice is, throughout and to the bitter end, of the sardonic order. He ends with a song: "Oh, you architects, you must be going blind. Can't you see you're getting left centuries behind? Your antiquated methods do not pay. The wholesale art-providers soon will have you on your knees." And another character closes the play with: "While you talked of Art, We played the part, And took the practice too."

Truly a merry trifle, and cunningly enacted withal! but through it all there runs something too much of the grim cynicism of the Morality play; and the non-moral affectations of the principal characters intensified the parallel.

A NEW TERROR TO ARCHITECTS.

It has recently come to our knowledge that at the annual pantomime celebrations of the students of Liverpool University, held on February 11th, the usual procession through the city was headed by the architectural students in a four-in-hand. The turn-out, which included liveried attendants (one armed with an eighteenth century coach-horn), attracted considerable public attention, and the popular interest was further increased by the frequent stoppages made outside various buildings, for the purpose of cheering or hooting them, according to the pleasure of the critical occupants of the coach. Thus, the Town Hall, by Wood, of Bath; Cockerell's, "Bank of England," in Castle Street; "The Athenæum"; St. George's Hall; and several other monuments of the Greek Revival, besides the statues of Michael Angelo and Raphael, flanking the entrance to the Walker Art Gallery, were greeted with the wildest enthusiasm, whilst some more modern products received equally sincere abuse.

Though the demonstration obtained an amused toleration from the man-in-the-street, it is not impossible that some of our present-day practitioners might have been less benignantly disposed.

Our Plate.

Cottages, Whitley Wood, Berks.

These cottages, which are now being built, are to be faced with purplish red bricks, the roofs being covered with irregular sand-faced tiles. The external woodwork is to be stained green, and the internal woodwork brown, with "Antirot." The cost of the cottages works out at slightly under 5d. per ft. cube. The builder is Mr. A. G. Harradence, of Reading, and the architect Mr. C. B. Willcocks, of Caversham, Oxon.

Proposed Footbridge Over River Wey.

This design by Messrs. Stuart H. Davies, C.E., and Gerald Swayne, A.M.I.C.E., of Westminster, was placed second in the recent competition.

The bridge has a span of 60ft., and allows 8 feet of headroom over the towing path, and 13 feet 9 inches over the centre of the river.

The footway is carried on arched ribs, which are built up in double segments, about 15 feet long, each segment breaking joint in the middle of the one above or below it. The segments are bolted together at the joints with pairs of ⅞in. bolts seated upon W.I. dovetail plates sunk flush in each edge of the rib. The arched ribs are tied together with 1⅛in. W.I. bolts and stiffened with 6in. by 6in oak wind-braces. The flooring consists of 2in. oak planks, spaced slightly apart. Oak to be used throughout.

AMERICAN ARCHITECTURE: WITH ESPECIAL REFERENCE TO WORK AT WASHINGTON.

By Francis S. Swales.

Abstract of a paper read before the Royal Institute of British Architects Monday, March 15th, 1909.

When I was asked to give a paper upon American architecture before this Institute, I recognised that I owed this compliment to the fact that I was known to members of your Council as having lived for so many years in America that my point of view might be expected to be that of the American, and that in limiting the subject in order to make it possible to be dealt with in the hour placed at my disposal I might naturally confine my paper to some subject in which I should believe American architects themselves to be especially interested. I knew, too, that it is characteristic of British generosity to expect to have to take into account the natural shortcomings of the foreign point of view, and to be rather indulgent with it—and I think the foreigner rather expects the indulgence—and I ventured to think I might interest you in a brief study of architecture as it has been, as it is, and as it will be in the United States, having especial reference to work at the national capital—Washington, in the district of Columbia.

Pierre Charles L'Enfant.

During the War of Independence, the French colonists lent their moral and material support to the American revolutionists, and France herself became their ally, and her subjects contributed most of the military skill and engineering that came to the assistance of Washington. Among these, one of the first to tender his services was Major Pierre Charles L'Enfant, who soon distinguished himself for conspicuous ability as a military engineer.

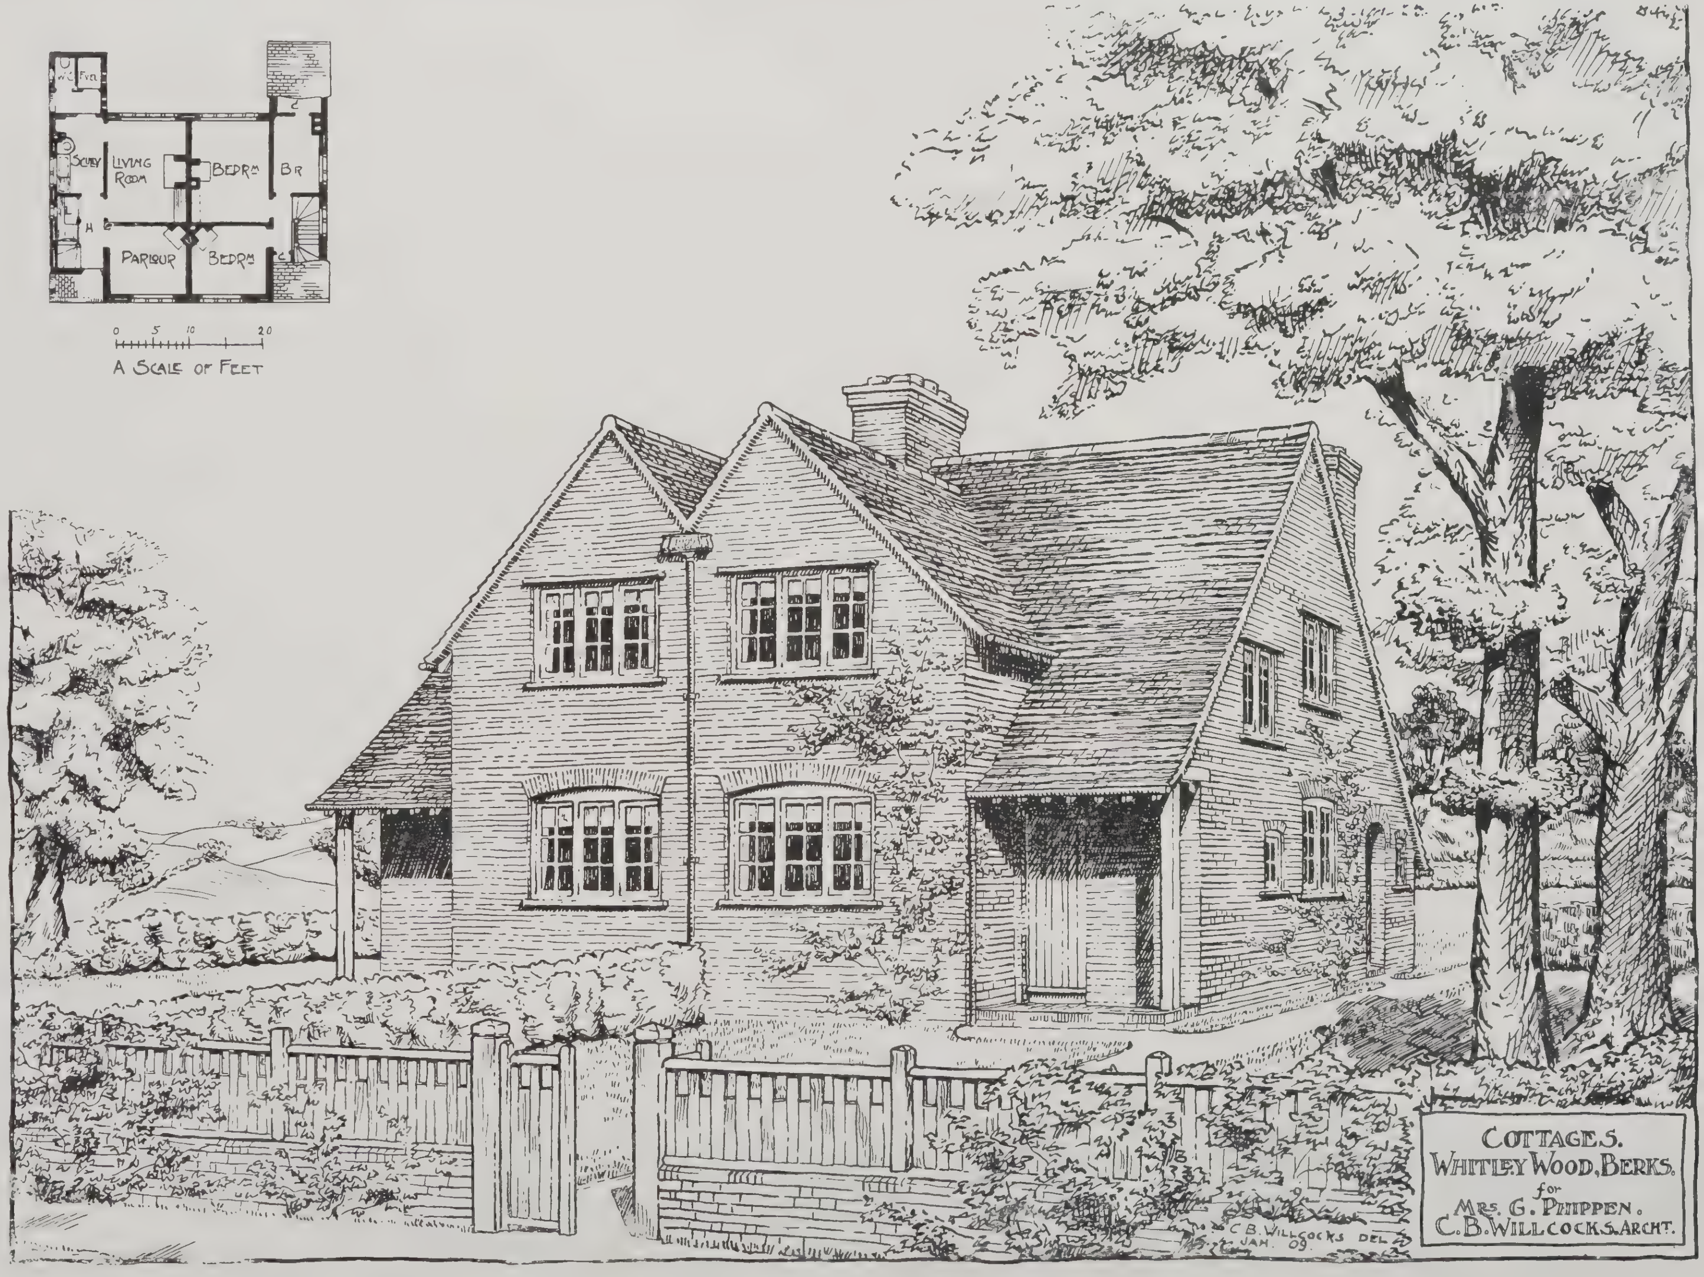
When peace and independence became established, the first thing to be considered was a form of government. When the Federal form had been adopted, General Washington was made President and Thomas Jefferson—the author of the Declaration of Independence—the first Secretary of State, one of the first things to be discussed was the proposition to establish a "Federal town, a Federal house for Congress and for the executive officers." The discussion as to where it should be located was long and heated, and strong sectional feeling became apparent. Philadelphia, New York, Baltimore, and other large towns urged their claims to be made the seat of the national Government. Maryland and Virginia offered the present territory on the Potomac on the 38 degree North latitude. Balloting gave no results; but, finally, an Act was passed conferring upon President Washington the sole power to select a Federal territory "not exceeding ten miles square on the River Potomac . . . for the permanent seat of the Government of the United States."

Thomas Jefferson.

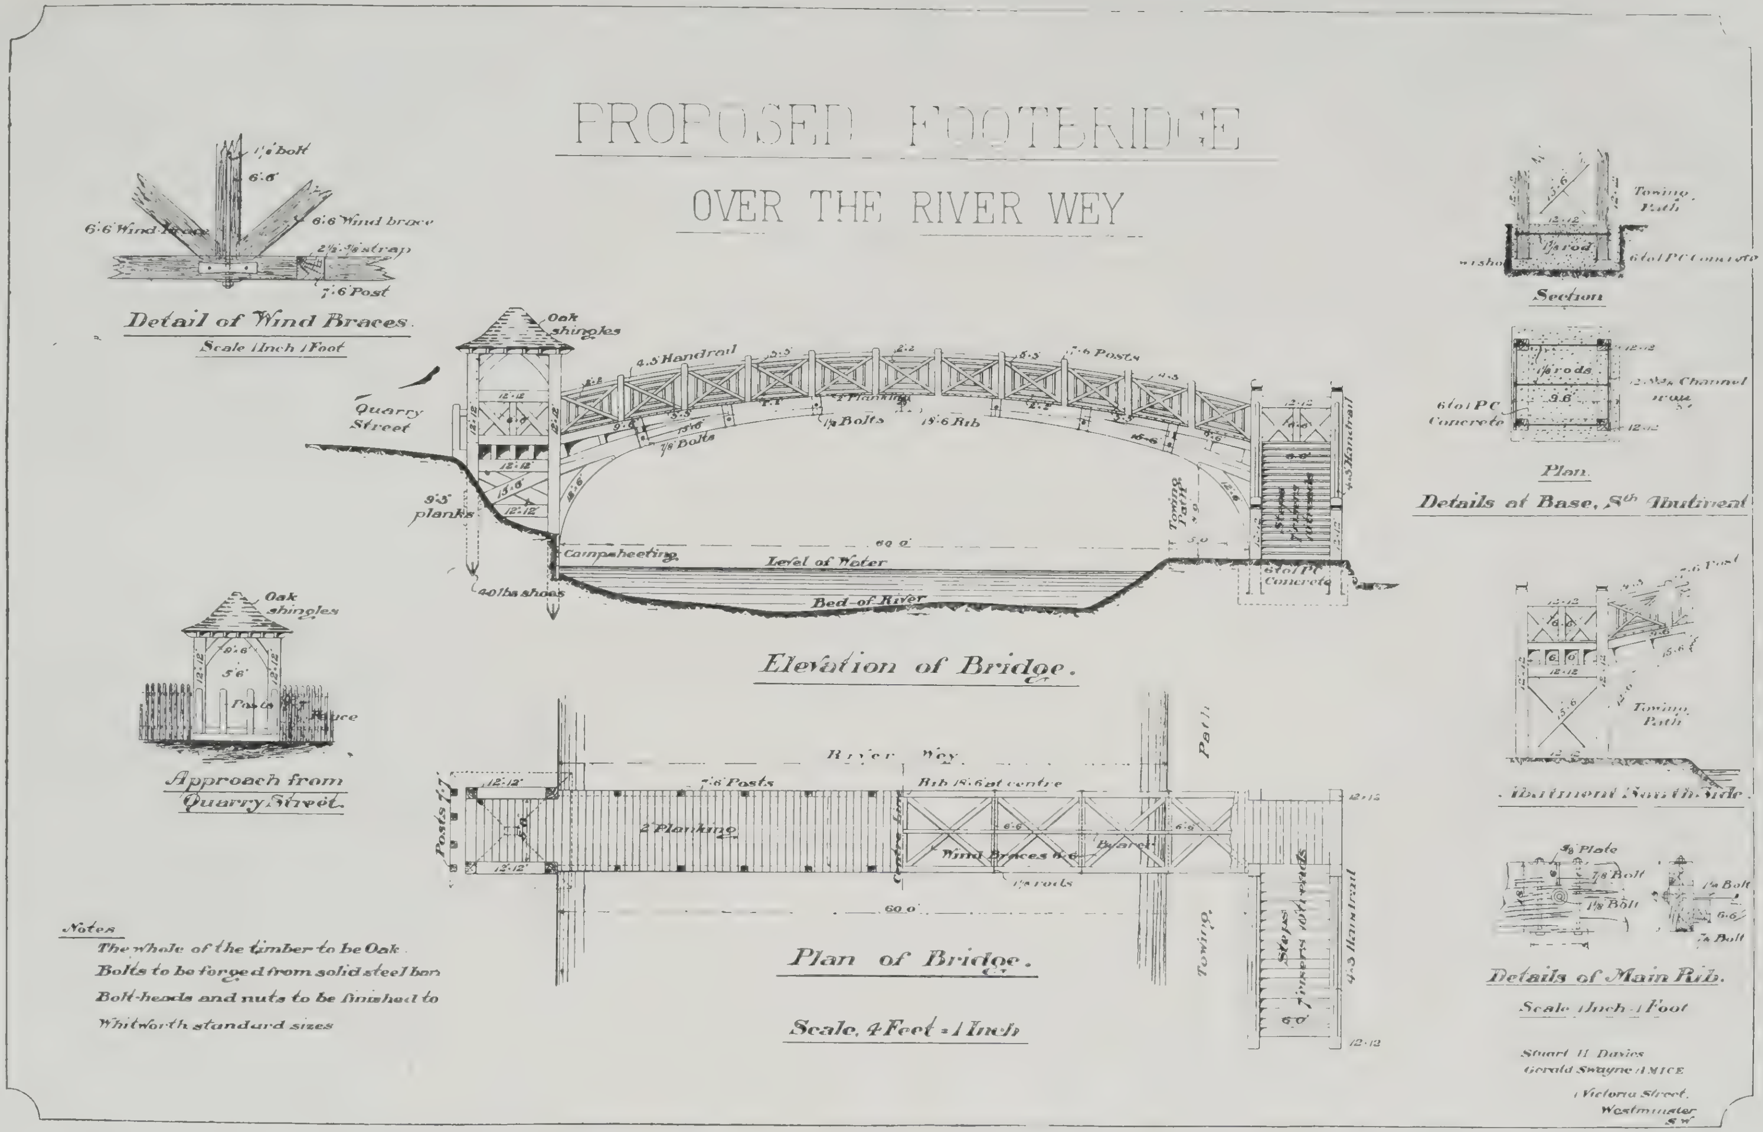
Jefferson—the author of the Declaration of Independence, the Secretary of State upon whom devolved the difficult task of arranging the diplomatic relations of the United States with the foreign nations—like many another gentleman of his day, had many callings, and seems to have been a planter, to have practised law without much pecuniary success, to have studied astronomy, gathered about him a library of great intrinsic value —in fact, the nucleus of the collection in the Congressional Library—and, what is most important to his connection with the establishing of the national capital, is the fact that he was by inclination and aptitude one of us—he was an architect—and after he retired from office at the expiration of his term as President of the United States, to which he was subsequently elected, he designed, among other things, the fine group of buildings for the University of Virginia and his own house, Monticello.

The Planning of Washington.

The Act of July, 1790, which gave the President the power to select the site for the



COTTAGES.
WHITLEY WOOD, BERKS.
for
MRS. G. PHIPPEN.
C. B. WILLCOCKS, ARCHT.



DESIGN PLACED SECOND. DAVIES AND SWAYNE, CIVIL ENGINEERS.

future seat of Government, authorised him to have it surveyed and planned, and to proceed with the construction of certain works and buildings. He therefore appointed three Commissioners to supervise the work and stand the criticism of the public—Major Ellicott to survey the territory, and Major L'Enfant to plan the city. To the last-mentioned he indicated that he thought the Federal House should be located in the centre of the town, and that the Executive mansion and offices should be kept well away from the Federal House "to prevent members of Congress from too frequently visiting the executive departments." To Jefferson he delegated everything and kept him informed of his personal wishes—possibly he had conveyed the desire "to prevent members of Congress" from interfering with the building of Washington, and that idea may have been uppermost in Jefferson's mind when in the "compromise" made with Hamilton he magnanimously proposed that Philadelphia should be the capital for the "first ten years." The versatile Secretary of State visited Europe, arranging diplomatic relations and collecting books, plans of buildings and maps of cities. The last he supplied to Major L'Enfant, and it may be—I think it probable, in view of the maps selected, namely, Paris, Orleans, Turin, Milan, Strasbourg, Carlsruhe and Frankfort, and the fact that L'Enfant was an accomplished military engineer—that it was at L'Enfant's request that the maps were obtained and he, L'Enfant, was probably familiar with them and knew something of their best features. It is probable, also that he knew of the various works of Le Notre. However this may be, he evolved from his study of them a plan for the city of Washington that was at once original, practical and beautiful; and to which the city will ultimately conform.

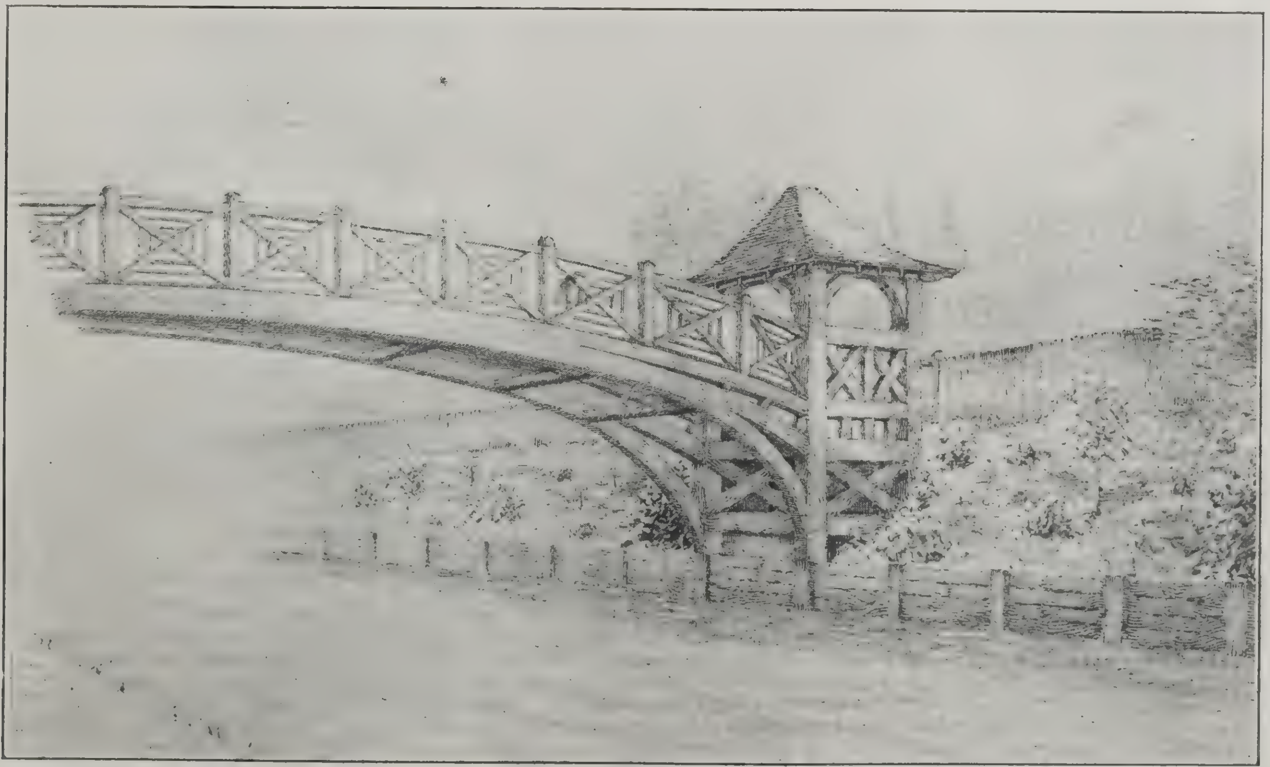
This plan provided for a central site for the "Capitol"—which was L'Enfant's designation of the Federal House—on the plateau at the intersection of two main avenues running north and south and east and west, designated as North, South, East and West Capitol Streets. The Capitol was located in a large park from which radiated twelve wide avenues, including the four known as Capitol Street, and two of each of the others (those extending in opposite directions) were named after the States of Pennsylvania, Maryland, New Jersey and Delaware. Other streets were then laid out parallel with the Capitol Streets, those extending north and south being designated by numbers, and those east and west by the letters of the alphabet. The President's house was located, facing north and south, in a park at the intersection of Pennsylvania Avenue and West Sixteenth Street. At the intersection of the principal axes of the Capitol and of the President's House it was proposed by L'Enfant to place the equestrian statue of Washington voted by the Continental Congress of 1783; and from this point to the Capitol to develop the West Capitol Street into a magnificent avenue four hundred feet wide and a mile in length, along each side of which, and situated each in the centre of its own grounds, were to be erected the "Grand Edifices." A "National Church," or kind of Pantheon for the reception of statues of heroes whom Congress might honour, was considered and mentioned in notes on early maps. The engraved map of 1792 shows sites for buildings, monuments and statuary, all arranged so as to present focal points along the principal streets, and, as L'Enfant says, "to reserve through the whole a reciprocity of sight" between the important points. Such was the plan approved by Washington and Jefferson and adopted by Congress in 1791, and which L'Enfant was entrusted to carry out.

L'Enfant's Town Planning.

L'Enfant's plans were, during his lifetime, carried out only so far as securing sites for the principal Government buildings, cutting down trees, and making a few of the principal roads. All available land was bought up by speculators, who held it at high prices, and thus retarded the growth of the town. L'Enfant refused to permit the speculators or land companies to have his plans, saying that they would spoil the city with their cheap buildings, and this attitude, coupled with his quarrel with Carroll, led to his dismissal. The personal interest which we know Washington and Jefferson took in the planning of the city and in the selection of sites for the important public buildings extended also to the selection of designs for the buildings, and, with Jefferson, even to the choice of painters and sculptors to execute monuments.

Stephen Hallet and Dr. Thornton.

The three Commissioners referred to above who were appointed to look after the laying out of the capital city were directed to "procure suitable buildings for the accommodation of Congress, and of the President, and for the public offices of the Government of the United States"; and, soon after the approval of L'Enfant's plan, they took up this important part of the work. In the year 1792 a competition was held to procure a design for the Capitol, and sixteen designs were submitted, but out of the lot none was regarded as being fit for serious consideration, and all were returned by Jefferson to their authors. Shortly afterwards a French architect, Stephen Hallet, of New York, presented a design to the Commissioners which met with general approval, and he was asked to journey to Washington to examine the site and perfect his design. About the same time Dr. Wm. Thornton, a Philadelphia physician and amateur architect, who had studied in Paris, presented an elaborate coloured design to President Washington, who was so impressed that he asked the Commissioners to adopt Thornton's design in place of Hallet's. Hallet declared that Thornton had stolen some of his rough sketches, and merely elaborated upon them. This charge Thornton vigorously denied, and the premium originally offered for a design was awarded to him. Thornton was not, however, considered to be competent to carry out the work, and Hallet was made supervising architect with a salary of £400 per year, and the work commenced after Hallet had shown that Thornton's plan was impracticable, and had revised Thornton's design. Thornton, who was what would to-day be called a political wire-puller, got himself appointed as one of the Commissioners, and a bitter quarrel ensued between the doctor and the architect. The Commissioners—no doubt at Thornton's instigation—requested Hallet to turn over all his drawings to them, which he flatly refused to do—and I think we all sympathise with his stand! He was, therefore, dismissed. George Hadfield, an Englishman, succeeded Hallet, but he, too, was badly treated by the Commission, and was forced to resign. A competition was also held for the President's House, and this was won and carried through by James Hoban, an Irishman, who had been a clerk of the works under Hallet. The President's House is a modest, though large and rather monumental, residence, belonging to the early type of the classic revival in England.



PROPOSED FOOTBRIDGE OVER THE RIVER WEY, GUILDFORD. DESIGN BY DAVIES AND SWAYNE, PLACED SECOND. (*See Centre Plate.*)

Mangin and McComb.

Leaving Washington for a moment, there is another public building which owes its American character—a character too much influenced by French design to be English, yet too English to be entirely won over to wholly French design—to the fact that, like the Capitol, it is the work of both French and English—or Irish—architects: the New York City Hall, built between the years 1803 (when Jefferson had become President) and 1812, from designs by Mangin and McComb.

Hoban and Latrobe.

To return now to the Capitol, after the dismissal of Hadfield, Hoban, the architect of the President's House, was next called in to continue the work. He completed the north wing of the Hallet-Thornton design, which is now part of the central block, in the year 1800. Three years later Benjamin Latrobe—a pupil of Cockerell—an Englishman who had cultivated the acquaintance of President Washington, was appointed to construct the south wing and re-construct the work upon the north wing which had been poorly executed under Hoban. He did both in accordance with his own plans, which did not differ materially from those of Hallet, Thornton, and Hadfield. He completed both wings in 1811, and built a kind of gantry between them.

The Capitol Destroyed and Restored.

The following year the Unites States declared war against England, and in August of 1814 the British troops took the City of Washington and burned the Capitol, the President's House and other public buildings, besides much private property. The walls of the Capitol and of the President's House withstood the flames. Latrobe, who was at the time in Pittsburg, was summoned by President Madison to return to Washington, and he proceeded with the restoration of the Capitol. To him is due the credit of designing the former House of Representatives now known as Statuary Hall—and the old Senate Chamber, used at present by the Supreme Court of the United States, and the old lobbies. He designed a low dome and the central portion of the east front, consisting of the colonnade and the pediment.

Bulfinch, of Boston.

He resigned in 1817, and was succeeded by Charles Bulfinch, of Boston, who was the first American-born architect employed on the Capitol. Bulfinch designed the hall of the old Library of Congress, which formed the projecting central feature of the West front, modified Latrobe's design for the dome, and designed the west front very much like the front of the Boston State House, of which he was also architect, and in 1827 reported that the Capitol was finished. The building completed by Bulfinch was, with the exception of the dome, what to-day constitutes the central block. It is 352ft. long by 121ft. deep, 70ft. high to the top of the balustrade, and to the top of the dome measured 145ft.

Latrobe's work was that of an architect of some—but by no means complete—training, and he introduced numerous trifling details and degenerate forms into his work on the Capitol, as, for instance, the segmental ceiling over the old House of Representatives. He, and Jefferson, who was then living in retirement and practising architecture, had much to do with the development of the so-called Classic Revival in America—the introduction of the use of Greek and Roman temples for buildings for all purposes. Presidents Madison and Monroe recognised that the earlier Presidents had spared neither time nor thought upon the study of the Capitol, and were opposed to any changes which would not be simply the logical development and extension of the original design. Latrobe and Bulfinch were both tied by restrictions in this respect. The construction of the rotunda and library indicate the growth of the wealth of the nation at that time; and the building of large groups of new colleges—the University of Virginia, Washington and Lee University, and Girard College, prove that the desire for higher education had taken hold upon the people during this period of prosperity. (There already existed several colleges and universities of note, including William and Mary, Harvard and Yale.) When Bulfinch handed in his report that the Capitol was finished he retired to Boston, and Robert Mills, designer of the old Pennsylvania State Capitol, succeeded him as a sort of resident architect or clerk of the works, but for twenty years nothing further was done to the Capitol.

The Growth of Public Buildings.

Immigration went on rapidly, the population of the country doubling and quadrupling during this time. The class of immigrants being principally farmers, mechanics, traders, and soldiers of fortune—strong, vigorous, and determined men, rather than subtle, refined, or politic. The suffrage was too easily obtained, and the votes of this horde of Europeans began to tell upon the class of men who attained the Presidency. The growth of material interests is evidenced by the building of the Treasury Department in Washington, the Customs House at Boston, the old National City Bank in New York, and similar structures at Philadelphia, Providence, Richmond, Rochester, Pittsburg, New Orleans, St. Louis, and other large towns.

"And It Was So."

In 1833 the old building of the Treasury was destroyed by fire. Mills was appointed to design a new one. It was intended to locate this department in what is now called the Mall—the park which in L'Enfant's scheme was to be traversed by West Capitol Street and made into a grand avenue—but Mills took so long deciding upon the site that President Jackson—a soldier by profession, and something of an old ruffian—lost patience with him due to his continued procrastination, and, it is said, meeting the architect just outside the President's house one morning he planted his cane at the spot where he was standing, and said "Here, right here is where I want the corner-stone laid." And it was. The building as erected breaks Pennsylvania Avenue and obstructs the view from the President's house to the Capitol and *vice versa*. The selection of this site was a serious blunder, and a frightful blot on L'Enfant's plan. The original portion was big, costly, and commonplace. To Jackson we must attribute the beginning of the appointment of army engineers to construct Government buildings. Perhaps he felt that as Washington and Jefferson had appointed engineers and architects—men of their own professions—that he should follow their precedent, by appointing others from his. On the other hand, his action was partially justified by the dearth of good architects. The commercial undertakings everywhere called loudly for the help of all the brains in the country; there were doubtless plenty of opportunities for architects who could have shown themselves competent to grapple with the problems of the times, but if a design for a church was required a Greek Ionic temple was presented, if a railway station a Greek Doric temple was considered the thing—by the so-denominated architects—and not only the President, but the railway companies and business firms placed their buildings in the hands of men who, if they knew little of engineering, had at least the advantage of knowing nothing about the works of Stuart and Revett or "Greek" Thomson.

Thomas Ustick Walter.

In 1850, when the enormous increase in population, and consequent increase in representation in Congress, made important extensions to the Capitol necessary, Thomas U. Walter, of Philadelphia, was practically the only architect left who could be entrusted with this great task. Walter was a classicist, but used the orders with intelligence, refinement, and effect. He was also an able, practical planner, and withal an artist competent to compose both as to plan and perspective. Between the year 1850 and towards the end of the Civil War he planned and carried out the extensions and dome of the Capitol as it exists at present. He treated the scheme boldly and simply, leaving the plan of the centre block as he found it, and adding two great wings, making a three-part composition. The longer axis of the old building runs north and south; the axis of Walter's two wings were made to run east and west, and the resulting masses in pleasing contrast to that of the old central structure. Walter began his design and carried it through to completion during the saddest period of American history—at the time when bitter controversy had arisen between the States of the North and South over the question of the extension of the slave-holding territory.

To be concluded.)

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Green Distemper.

PLUMSTEAD.—SENEX writes: "The interior of a public building has recently been distempered pale green. The plastering is good and has been twice previously distempered. The walls were washed, but the old pink distemper was not completely removed. After a coat of clearcole, slightly tinted, a finishing coat of distemper, said to be stained with Brunswick green, was applied. The work has dried very unevenly, in shades of varying depth, and does not look solid. The contractor attributes want of uniformity to the frosty weather which prevailed while the work was being done. Would severe frost account for the unsatisfactory result, and what remedy would you suggest? It might be added that the ceilings have been distempered pale cream colour, and possibly some of the surplus stuff has been mixed in with distemper for walls."

Frost would very likely account for the defect, although possibly the distemper was not properly mixed. The only thing to be done is to wash it off and give it another coat, preferably of washable water paint, which would come cheaper in the end.

Civil Service and L.C.C. Appointments.

LONDON, S.W.—L.M.P. writes: "To whom should application be made for a place as assistant at the Admiralty, War Office, or L.C.C.?"

Inquiries in regard to architectural assistants at the Admiralty should be addressed to the Secretary, Department of the Director of Engineering and Architectural Works, at 21, Northumberland Avenue, W.C. We do not know of any openings for such in the War Office Departments, but inquiries might be made in regard to the matter from the Department of the Civil Member of the Army Council and the Building Works Department of the Ordnance Committee. With regard to the London County Council, there are several departments in which architectural and survey assistants are employed, but in the first instance it is best to apply to the Superintending Architect, County Hall, Spring Gardens, S.W. Your correspondent might profitably refer to "The Civil Manual," published by the Civil Service Press, Chancery Lane, W.C. B.

Rights of Light Question.

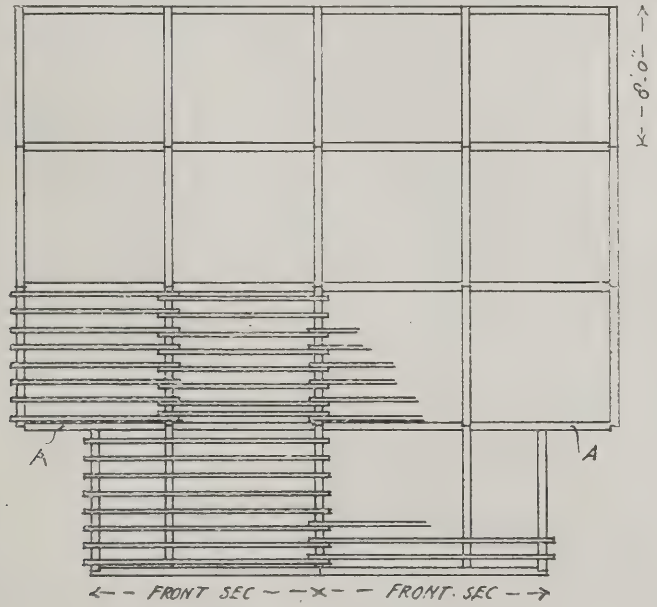
YORKS.—J. E. H. writes:—"The owner of a house has recently pulled down a covered portico (plan enclosed, but not reproduced), carried on columns, leaving the columns standing on the wall 3 by 6 high. Between these columns he has erected a glass screen, filled with obscured glass. This appears to have been erected to prevent people entering the church from looking into the house entrance. The portico was a heavy one, with concrete or lead roof, and evidently made the entrance hall to the house rather dark. By removing same, the owner secures top lights to his hall. This portico was open on all three sides, and unglazed. The trustees of the church are afraid that this screen will secure to the owner of the house a right of light which might at some time prevent a porch from being built. Both properties have been built more than twenty years. (1) Does this glass screen constitute a 'light' (the top of porch is now quite uncovered, and screen stands alone between two columns)? (2) Have the trustees any right to block this screen on the assumption that (1) is answered in the affirmative? (3) Would any purpose be served by blocking it? (4) Would not the fact that the porch had open end where screen now is give it the right whether glazed or not?"

(1) I do not think that the screen *per se* would constitute a light that might become ancient, but you must, of course, face the fact that everything was previously open, and that, if anything, the screen forms a curtailment, and not an enlargement, of whatever right of light may have previously existed. (2) The trustees have precisely the same right as they had before the erection of the screen—neither more nor less—and if the entrance hall has a window which has been in existence 19 years and a day, they must regard it as an "ancient light," and so leave it alone. (3) I doubt the expediency, but I cannot see that it would do any harm. (4) Not the portico, but the light to the entrance hall behind it, would form the ancient light (if any). F.S.I.

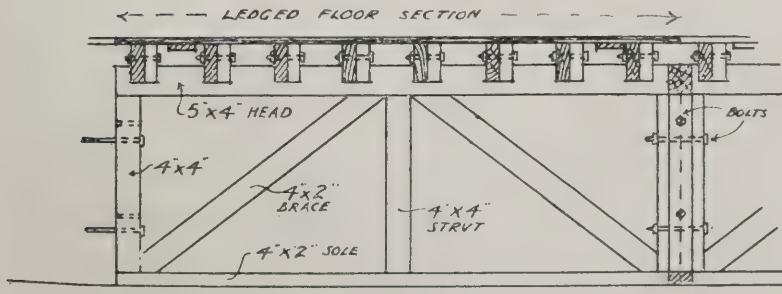
Platform for Drilling and Gymnastics.

LIVERPOOL.—NATAS writes: "Could you furnish me with a sketch of the construction of a removable platform to be used at the annual display of a Boys' Brigade (drilling and gymnastics), to be in sections and easily handled, which would meet with the requirements of the building surveyor? Size of platform, 32 ft. by 32 ft. by 3 ft. 6 in. high, with two flights of steps at each side."

The purpose of this platform renders necessary a considerable degree of strength and rigidity, which makes it difficult to secure lightness and easy handling. In the accompanying sketches, interchangeability of parts has been aimed at, to ensure ready re-erection by unskilled labour with the minimum risk of error. The 36 framed bearers are all similar, although 16 of them may serve for stiffeners only, without carrying any proportion of the weight. The system should be easily grasped from the small-scale plan—briefly, the bearers running from front to back are butted end to end, and bolted together with two three-quarter inch screw bolts. They are braced apart by similar bearers bolted through *between* the ends of the first-named series (grooves should be cut to allow the bolts to pass). The bolt holes (in pairs for alternative purposes) should not be the same distance up at bottom as they are down at top, in case one or more sections might be inadvertently reversed in fixing. The sections "A" should be specially marked, and have bolt-holes in centre strut, for bearers, and also staples for attachment of stairs. The front screen is in two sections, and the steps with their landings may be separately framed. 7 in. by 2½ joists are notched out 3 in. over bearers and lapping at ends, where they should be bolted together after fixing with ½ in. bolts. The flooring may be ledged together in sections about 8 ft. by 4 ft.



GENERAL SKETCH.



DETAIL SKETCH.

ILLUSTRATING REPLY TO LIVERPOOL.—"NATAS."

Strength of Floor.

LONDON, S.W.—STUDENT writes: "For general practice, what dead weight per foot superficial should be allowed in constructing dwelling-house floors?"

The common rule for scantling for fir joists is: "Depth in inches equal half span in feet plus 2, thickness equal one-third depth." Applied to the given span of 14 ft., this rule would indicate

$\frac{14}{2}+2=9$ ins. deep, and $\frac{9}{3}=3$ in.

thick, and a careful architect might be relied upon to use regular 3-in. by 9-in. deals for this purpose. The allowance for external load upon a dwelling-house floor varies from ¾ cwt. to 1 cwt. per foot super, but it is generally allowed that upon a wooden floor in a private house a total of 1 cwt. per foot super for live and dead load together is sufficient. The writer's practice in estimating the safe load on a fir beam or joist is to allow a factor of safety of 7, this converts the ordinary formula of $W=\frac{cbd^2}{L}$ where W = breaking weight in centre in cwt. and c = constant 3.5 into $W=\frac{bd^2}{L}$, where W = safe load in cwts. distributed, which is, after all, what is usually wanted. By this formula the safe load on a 2 in. by 8 in. joist 14 ft. span would be $W=\frac{bd^2}{L}=\frac{2\times 8^2}{14}=9\frac{1}{7}$ cwts., and safe load per foot super when placed 12 in. apart

$$=\frac{9\frac{1}{7}\text{ cwts.}}{\frac{14\text{ ft. span}\times 14\text{ in. centres}}{12\text{ in. in 1 ft.}}}=56\text{ cwt.}$$

or about half of what should have been provided for. HENRY ADAMS.

Continuous Louvres and Gear for Working Them.

BREDBURY.—A. C. writes: "Please give names and addresses of makers of louvre ventilators, and opening and closing appliances."

Almost any maker of builders' ironmongery could supply the necessary fittings, say Gardiner, Son and Co., Ltd., Nelson Street, Bristol; James Gibbons, St. John's Works, Wolverhampton; C. Kite and Co., 132, Euston Road, London, N.W.; Pryke and Palmer, Upper Thames Street, London, E.C., unless some special make is wanted. The louvres of a continuous series are always pointing downwards to the outside to discharge rain and moisture away from the interior. A small gutter is often added inside. HENRY ADAMS.

Old Book on Carpentry.

LONDON, N.W.—W. B. writes: "I have a copy of the third edition of 'The Elementary Principles of Carpentry,' by Thomas Tredgold, published in 1840. Is it of any value?"

The work by Tredgold on Carpentry has practically no value. B. T. B.

Removing Stains from Pavement: Cleansing Closet Trap.

IPSWICH.—H. M. C. writes: "Can you inform me (1) what will remove oil stains from an old pavement floor, and (2) what will clean the trap of a pedestal closet that has been much neglected?"

(1) Wash the pavement with hot turpentine. If this still leaves a mark apply powdered fuller's earth, and put upon it a hot flat iron. Do this several times, if necessary. The heat will liquify the grease when the fuller's earth will absorb it. (2) Try strong hydro-chloric acid, applied with a piece of rag tied on the end of a stick.

J.

Sewage Powers.

SEATON.—SEWER writes: "I am the owner of a field through which the local council are taking a new sewer, without making any arrangements with me. Their surveyor informs me that they (the council) are fully empowered to do so. Is this correct, and if so, by what Act is the power obtained? The matter was not mentioned to me in any way."

The local sanitary authority possess compulsory powers by virtue of which they can lay a sewer through private property in this way; but they must pay for any damage or loss caused by their action, including consequential damage, such as the decreased value of the land for building purposes (if any) caused by the presence of the sewer, and possibly manholes, on your property. I advise you to draw the attention of the sanitary authority rather sharply to their high-handed action, and to place the matter in the hands of your solicitor, or of a compensation surveyor, for settlement. You may take a lump sum or an annual rental.

F. S. I.

Ascertaining Price of Timber Scantlings.

Herne Hill, S.E.—R. S. writes: "Are there published any sets of tables showing how to ascertain the price of timber in scantlings?"

A book that will probably answer your purpose is "The Timber Merchant and Builder's Vade Mecum," by George Bousfield, published by E. and F. N. Spon, although it does not appear in their latest catalogue.

Henry Adams.

Point in Practical Acoustics.

Sunderland.—T. K. writes: "Please state whether in your opinion the transverse plaster arches shown in the enclosed sketch of a church (not reproduced) would interfere to any extent with the audibility of the preacher's voice?"

So little is known of the science of practical acoustics, that it is difficult to forecast the result in any particular case. Looking at the proposed sketch, it would seem probable that the voice would be somewhat checked in reaching the full distance, but echoes and reverberation would not occur. See Prof. Roger Smith's "Acoustics in Relation to Architecture and Building" (Lockwood, 1s. 6d.).

Henry Adams.

Current Domestic Work.

Cheshire—("Teak").—(1) What name would you give to the domestic architecture so much in vogue now, in which buildings are, say, stock brick for the height of the ground storey and roughcast above, tiled roofs? (2) Are there any canons to be studied in designing buildings constructed as above? For instance, may the roughcast be commenced at the line of the heads of the ground-floor windows, or half-way between these heads and the bedroom window-sills with equal correctness? (3) Chimneys springing from the roof, not connected by the walls, as they would be if at an outside wall, may, I suppose, be of stock brick instead of covered with roughcast, if desired? (4) Is there any special pitch for the roofs? (5) Any information about this class of work will be greatly esteemed.

(1) No special names are properly applicable to any current methods of architectural design. Names are attached by historians to distinguish past styles—it is only the imitations of these styles in modern times which can be indicated with tolerable accuracy by terms other than descriptive. (2) The principles to be adhered to depend upon the purpose which the roughcasting is intended to serve, though the main object should always be to secure good proportion between the spaces. For instance, if the roughcasting is a protective addition to thin walls, it would obviously be foolish not to cover the whole of a storey; but if by so doing an unpleasant proportion is obtained, the coating may be extended below this to the heads of the windows under. If the object is, however, solely æsthetic, such as the correction of an unduly high proportion by the introduction of markedly horizontal bands, the roughcast may start at any level which best achieves the effect desired. (3) Chimneys may certainly be in brick. (4) The pitch of roofs will depend entirely on circumstances: 50 deg. is a usual angle for gabled roofs, and is better than square pitch. (5) As a general hint, it may be said that roughcast walls rarely look well unless it is possible to set the window frames flush with or in advance of the outer face (*i.e.*, without reveals). Also the surface of the roughcast should not be too rough, and is best tinted white or cream; the gravel-beach affair beloved of the speculative builder is deserving only of execration.

G.

Employment on the Ordnance Survey.

Neath.—S. K. T. writes: "Please state methods of procedure in order to obtain posts on the Ordnance Survey."

Assistants on the Ordnance Survey are mainly taken from three classes, viz.: (a) Boys whose parents or relatives live at or near the Headquarter or Division offices. These boys join young at low rates of pay, and are gradually trained to Ordnance Survey duties. (b) Young men who join an office for training as draughtsmen, etc., or a field section for training in field work. The rate of pay on joining is not usually more than 15s. to 18s. a week. These cases are infrequent. (c) Labourers, who join at the rate of 16s. 6d. a week, getting 18s. a week after one year's service, if not less than twenty years old. Applications for employment should be addressed to the Director-General at Southampton, or to one of the local division offices at Carlisle; Clifton, Bristol; Edinburgh; Redhill; Redlands, Bristol; and York. Applications for employment in the field should always be addressed to one of the local division officers. There is no prospect at the present time of any additions being made to the Civil force. The military staff—both commissioned and others—are Royal Engineers.

Stability of Reservoir Wall.

Pontypridd.—G. L. M. writes: "Please advise as to the stability of the wall shown in the accompanying section."

It appears that the design submitted, as shown in sketch herewith, will be just strong enough. The method of working will be as follows: From A set off A B, making the angle between it and the back of wall equal to the natural slope. Produce the slope of surcharge to meet A B produced in C, and construct a semi-circle on A C. From the junction of back of wall and surcharge drop a perpendicular on to A C and produce it to cut the semi-circle in D, then with centre C and radius C D describe an arc cutting A C in B. Then the horizontal thrust from the earth will be $\frac{1}{2}w\,(AB^2)=\frac{1}{2}\times 94\times 6^2=15.1$ cwt. acting at one-third of the height of wall. The equivalent thrust parallel with the slope of surcharge is found as shown, and combined with the weight of wall giving a resultant which cuts the ground line at 1.3 ft. from centre of base. The stresses thus produced when the reservoir is empty will be

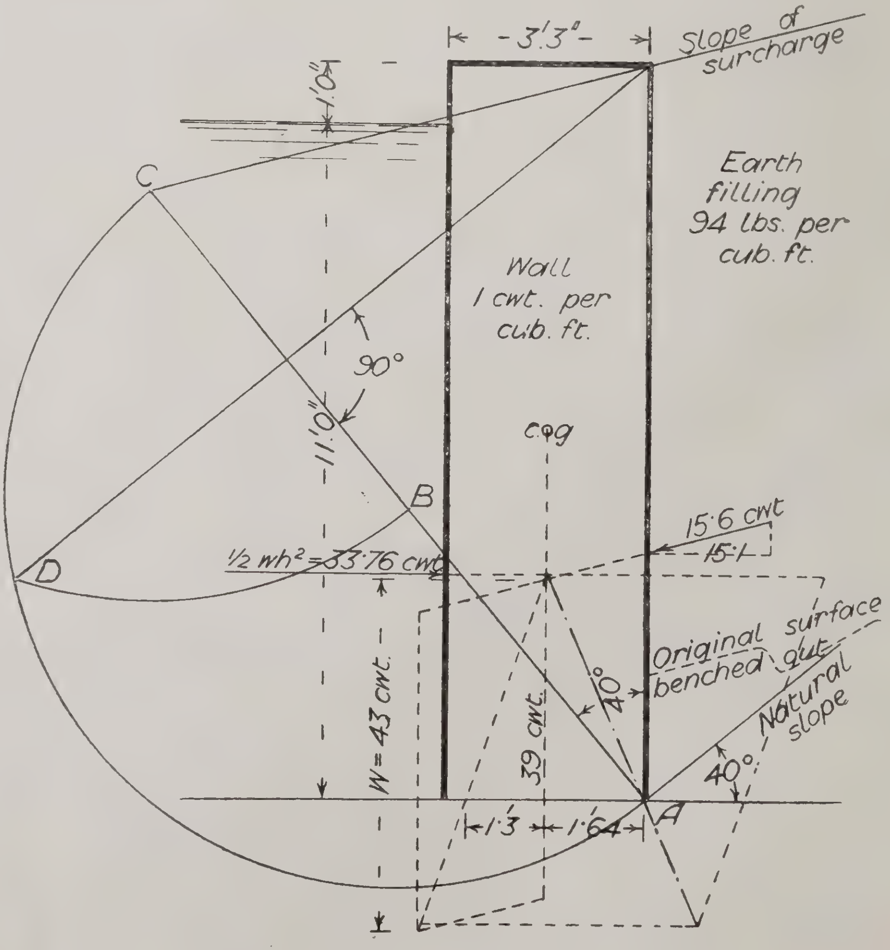
$$\frac{W}{A}\pm\frac{M}{Z}=\frac{43}{3.25}\pm\frac{43\times 1.3}{\frac{1}{6}(1\times 3.25^2)}=13.23\pm 31{\cdot}2$$
$$=44.43 \text{ cwt.}$$

or 2.22 tons per square foot compression at water edge, and 17.97 cwt., or 0.9 tons per square foot tension at earth edge. This resultant is next combined with the thrust from water giving the final resultant which cuts the base line at 1.64 ft. from centre of base. The stresses produced when the reservoir is full will be

$$\frac{W}{A}\pm\frac{M}{Z}=\frac{43}{3.25}\pm\frac{43\times 1.64}{\frac{1}{6}(1\times 3{\cdot}25^2)}=13.23\pm 40$$
$$=53.23 \text{ cwt.}$$

or 2.66 tons per square foot compression at earth edge, and 26.77 cwt., or 1.34 tons per square foot tension at water edge.

Henry Adams.



ILLUSTRATING REPLY TO PONTYPRIDD.—"G.L.M."

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
April 10.	BOLTON BRANCH PUBLIC LIBRARIES. The Libraries Committee of the Corporation invite competitive plans from architects who have been principals in the County Borough of Bolton six months prior to the present date, for Branch Public Libraries to be erected in the districts of Astley Bridge, Halliwell, and Gt. Lever. The plans and particulars may be obtained from Samuel Parker, Town Clerk, Town Hall, Bolton. Deposit, two guineas.
April 12.	ELLAND NEW SECONDARY SCHOOL. Architects having offices and practising in the West Riding of Yorkshire are invited to compete for the work in connection with the new Secondary School at Elland, and should apply for particulars to Mr. Leonard Clegg, Holiwell Green, near Halifax.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading. Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second, and third respectively. Assessor: Mervyn E. Macartney, F.R.I.B.A., F.S.A.
July 31.	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	BOURNEMOUTH BRANCH PUBLIC LIBRARY. Architects practising in the County Borough of Bournemouth are invited to submit designs for a new Branch Library at Boscombe. Particulars from Charles Riddle, Borough Librarian, Central Library, Bournemouth.
No date.	WALLASEY U. D. COUNCIL CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

Holgate Grammar School, Barnsley.

This competition was assessed by Mr. A. W. S. Cross, M.A., F.R.I.B.A., in conjunction with Mr. A. V. Houghton, the West Riding County Council's Chief Inspector for Higher Education, some weeks ago. It has now been announced that the design of Messrs. Crouch, Butler, and Savage, of Birmingham, has been adopted. The designs selected by the assessors were as follows:—First, No. 42, second, No. 44; and third, No. 11. On enquiry of the Clerk to the Governors, we are informed that the design of Messrs. Crouch, Butler, and Savage is first, but the names of the other architects cannot be disclosed at present.

Pontardawe Guardians' Office.

The design submitted by Mr. A. U. Leon, of 20, Working Street, Cardiff, has been selected in the above competition.

Berkshire County Offices, Reading.

An enquiry having been addressed to us on the point, we take this opportunity of saying that this competition is an open one.

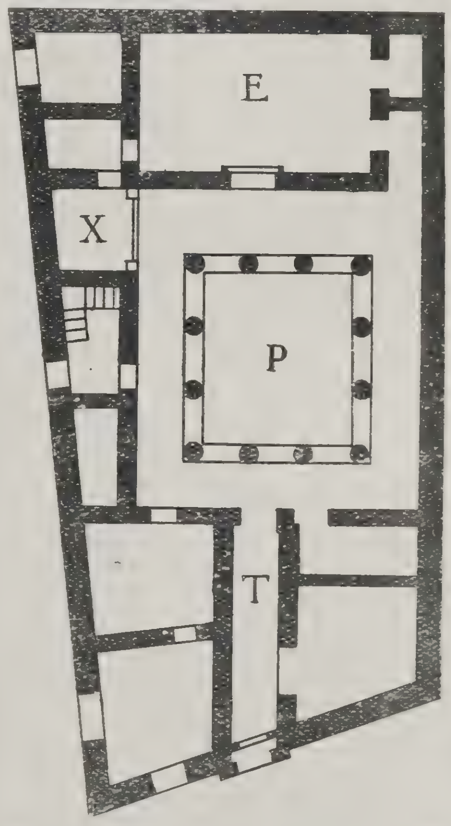
Bethel Independent Chapel, Penclawdd.

The design of Mr. W. Beddoe Rees, of 3, Dumfries Place, Cardiff, has been selected in the above competition.

Societies' Reports.

University of Liverpool Architectural Society.

At the third ordinary meeting of the Architectural Society of the University of Liverpool, Professor Myers delivered a lecture on "The Homeric House." In the main, the lecture was a subversion of the theories concerning the plan of the Homeric House generally accepted down to the time of Schliemann's excavation of Tiryns. These theories, restated by the late Sir Richard Jebb on the morrow of Schliemann's discoveries, and since generally accepted by British scholarship, regardless of Continental criticism and the inevitable deductions from subsequent evidence, Professor Myers demonstrated, were largely based on an ignorance of the exact significance of certain Homeric phrases, and on a misinterpretation of Vitruvius's statements (vi., 5.) as to the relation of the men's quarters in an Hellenic house to those of the women. The main problem involved in the controversy, which has passed through so many phases, is as to the position of the Thalamoi (bed-chambers) with regard to the megaron (main hall). Both the literary and archæological evidence refuted the traditional view, in which Jebb persisted, that the women's quarters were entered through a door on a raised dais at the inner end of the megaron; actually the women were not restricted to any particular portion of the house, and there is no evidence in Homer for the supposition of the existence of either a dais or a second door—the phrases "ashen threshold" and "stone threshold" referring not to two distinct doors, one at either end of the megaron, but simply to one door, the main entrance, which was provided with a wooden sill, to receive the door pivot, placed across the stone floor-slab. In conclusion, Prof. Myers dealt with the latest stages in the controversy, showing that the Homeric house more closely corresponded with the Mycenæan than with the Hellenic (Delian) house. Though no evidence has yet been discovered as to the character of the early Hellenic house, more copious data concerning the Homeric house have been obtained from Knossos and other sites, enforcing a distinction between the mainland and the insular type, and proving that, whereas both the Mycenæan and Knossian dwellings are of Minoan origin, the Achæan house has probably a central European source, and may be compared in its general arrangement with the "House of Priam" in the Iliad, which can be interpreted as still more closely resembling the Central European prototype, with large inner court and numerous specialised chambers, all opening equally on to it.



GROUND PLAN OF THE HELLENIC HOUSE (DELOS) ACCORDING TO VITRUVIUS (AS REVISED).

E. Exedra or Lounge.
X. Pastos—a recess probably representing the last traces of the Homeric and Mycenæan Megaron.
P. Peristylion—regarded by Vitruvius (revised) as the women's quarters.
T. Entrance passage to Peristylion between outhouses utilised as stables, shops and stores.

Liverpool Architectural Society.

At the fourth members' meeting of the Liverpool Architectural Society, held on Monday, March 15th, in the society's rooms, 13, Harrington Street, Mr. Ramsey Traquair, A.R.I.B.A., read a paper on "Mediæval Architecture in Greece." Mr. Traquair briefly traced the early history of mediæval Greece from the time of the fourth crusade (1202) to the Turkish conquest in 1460, during which period Greece was under Frankish or European influence, and formed part of the Latin Empire of the East. Though, in the architecture of that epoch, Western influence is apparent, the actual effect of the Crusades on the arts is curiously small. Practically in Elis alone, the first and last stronghold of the Frankish power, are there any buildings of definitely Gothic character, having buttresses, pointed rib vaults, and traceried windows; and even in these the masonry is built in the typical Byzantine manner of alternating brick and stone courses. For the rest, elsewhere, a few occasional points of detail are the only evidence to distinguish the work as of Western origin. The mediæval castle at Geraki is, however, an exception, the treatment of its walls displaying the full development of the Gothic rampart. The lecturer then passed on to a consideration of the evolution of the Byzantine church plan, from the simple cell form, usually very small, terminating in a semi-circular apse and with a small narthex often attached, to the more complex type consisting of two intersecting cells. The former, common in early Christian times in Italy and the East, and in Romanesque architecture in Europe, is not a usual Byzantine arrangement, except in Greece, where it is vaulted by a simple brick barrel vault. The latter more elaborate type is well illustrated by the Church of Hagia Paraskevé at Platza, on the western coast, which, with its transverse and longitudinal vaults and richly patterned brickwork, is admirably characteristic of the later Byzantine school. An example from Vilyto furnishes a further development of the church plan, the long barrel-vaulted cell being divided into three bays by transverse arches, and the centre bay covered by a high drum dome on pendentives. Contrary to the usual practice, this drum is unpierced, and the brilliancy of the Greek sun is such that the interior of the church is quite adequately lighted by a small side door and two windows, each some 6 inches wide by 3 feet in height—a fact which has an important bearing on the much-discussed problem of temple lighting. The next important step in planning was the substitution of columns for the four inner angles of the cross plan—a practice universal in all Byzantine lands from the tenth century onwards. In Greece the place of the western columns is frequently taken by square piers, and a strong tendency is evident to lengthen the western arm. The long basilica-like plan evolved in the fourteenth century, under Italian influence, was the inevitable outcome of this tendency, and is essentially different from the true Byzantine type, being concentrated to the eastern end and not to a central dome. Mr. Traquair illustrated the treatment of the central dome internally and externally by many excellent slides, showing examples of the low conical roof and flat cornice type, and others in which the more distinctly Byzantine form is employed, the arches of the external octagon breaking up into the roof. Internally, the solution of the problem of covering a large floor space by the dome was arrived at through the introduction of octagonal squinches, which may be regarded as cutting off the lower parts of the pendentives, that would otherwise be impossibly large and deep in the ordinary square plan. The lecture concluded with an examination of the Venetian influence, in the sixteenth century, on the military architecture of that time in Greece. At the request of the chairman, Mr. P. C. Thicknesse, F.R.I.B.A., a vote of thanks was proposed by Mr. Edmund Kirby, and seconded by Professor Reilly. The latter, whilst expressing his appreciation of the value of Mr. Traquair's research work in Greece, deplored that archæological tendency in architecture which tended to revert to the immature forms of this early Byzantine work, regardless of its remoteness from the requirements of our own civilisation.

Gloucester Architectural Association.

At a meeting of this association, the president (Mr. H. W. Chatters) in the chair, Mr. F. W. Waller read a paper entitled "A Holiday in Egypt." Commencing with Cairo, the lecturer described the principal temples on the banks of the Nile as far as Philæ, illustrating them with very fine lantern slides, both of the buildings themselves and their details, those of Luxor, Thebes, Karnac, and Philæ being especially beautiful. In addition, Mr. Waller gave much historical information on Egyptian architecture, and contrasted by means of specially prepared lantern views the Great Pyramid with Gloucester Cathedral and its precincts, and the Great Hall of Karnac (the largest temple in the world) with the nave of the cathedral, the latter appearing very diminutive beside the former. A short discussion followed the paper, after which, on the proposition of the president, seconded by Mr. Englefield, and supported by Mr. H. Medland, a unanimous vote of thanks was accorded to Mr. Waller for his paper.

Institute of Builders.

The twenty-fifth annual general meeting of the Institute of Builders was held at 31 and 32, Bedford Street, Strand, W.C., on Thursday, March 25th. The annual report was submitted, and the audited accounts and balance-sheet for 1908 were adopted. The following is a list of the elections:—President, Mr. W. F. Wallis, J.P. (Maidstone); vice-president, Mr. R. W. Neill, J.P. (Birmingham); treasurer, Mr. W. Shepherd (London); hon. auditor, Mr. F. N. Cowlin (Bristol); executive council, Mr. E. J. Strange (Tunbridge Wells,) Mr. Ernest J. Brown (London), Mr. G. Bird Godson (London), and Mr. W. Lawrence, jun. (Waltham Cross). A hearty vote of thanks was passed to Mr. J. Carmichael, J.P., for his able occupancy of the presidency during the past year.

Birmingham Clerks of Works and Building Foremen's Association.

The fifth lecture of the session of this association was given at the Midland Institute by Mr. H. C. Stilgoe, M.I.C.E., the City Engineer and Surveyor of Birmingham. The subject was "Road Construction," and the lecturer traced the construction of roads from the early work of the Romans to that of Telford and Macadam, pointing out by means of samples and diagrams the materials used at various times, and the methods of working. He then treated of paved roads, and explained the advantages and disadvantages of such paving materials as hard and soft woods, granite setts, asphalte, etc., and concluded by referring to the experiments which have been made to lessen the dustiness of roads and to cope with the rapidly increasing motor traffic. Mr. Stilgoe gave it as his opinion that, taking into consideration the cost, tar-spraying on well-made macadamised roads was the best method, but that even this, cheap as it is compared with other methods, was far too costly for rural authorities to undertake if they had to depend for funds upon local rates. Consequently he felt sure that very soon the Government would be obliged to take over the maintenance of country main roads as a national matter. At the conclusion of the lecture, a hearty vote of thanks was accorded to the lecturer.

DECORATIVE PLASTERWORK.

In his lecture on "Plaster-work," delivered at the Carpenters' Hall, London Wall, E.C., Mr. Laurence A. Turner traced its historic growth in design and treatment. The terms used in describing the various kinds of plaster-work were dealt with. Stucco-duro is carbonate of lime mixed with sand. This is the material used by the Italians, and was modelled in situ. The quicklime is mixed with water, and is kept in a moist state for months, and in some cases years, when it can be modelled like clay. Pargetry is made of lime mixed with sand and hair. Plaster of Paris is sulphate of lime, and sets hard in a few minutes when mixed with water. Fibrous plaster is a plaster of Paris strengthened by wood laths and canvas.

The earliest form of plastering in England was that of the dauber—that is, wooden structures covered with wattles, between which was squeezed the clay, and this was smeared over the face. Later, clay and sticks were used in filling in between framings, and an example was shown in which ash and hazel sticks had been used. The hazel had quite decayed, but the ash remained. The man who did this claywork was called a "dauber," and men are to be found to-day who call themselves daubers. After briefly referring to some remains of plaster-work in Saxon and Norman churches, the lecturer said that the next great advance was to mix hair with the lime and sand. This was called "Parge" or "Pargetry." The lime sometimes had chopped hay mixed with it instead of hair, and pebbles for rough-cast, as we have it to-day. It was not until we come to the time of the ambitious Cardinal Wolsey that the art of the plasterer came into prominence, mainly through the introduction of Italian workers, as may be seen in the ceiling of Wolsey's Closet, Hampton Court. In Henry VIII.'s reign the ceiling panels were smaller than those which followed, the tendency being for them to increase in size as time went on. The Italians worked in stucco-duro, and as their work here was exotic, it is scarcely fair to criticise it.

We Englishmen, the lecturer continued, do not realise that our plaster-work is second to no other country in the history of the world, with the exception of Italy. It is the domestic plaster decoration work of which we should be so justly proud, and which is so often ruthlessly thrown into the rubbish cart, to make way for a modern piece of engineering. Though the imported Italian workmen gave a stimulus to the craft, it was a still further development of a native tradition; and although the English plasterers made full use of their examples, yet they produced something entirely fresh and new. Mr. Turner here referred to the wonderful plaster building of Henry VIII.'s reign, known as the Palace of Nonsuch, and quoted passages referring to it from Mr. Bankart's book on the art of the plasterer, and Mr. Millar's on plastering, and two slides were shown of the palace. During the reign of Elizabeth, he continued, there was great activity in building, and such houses as Haddon, Crewe, Chatsworth, and many others, all of which are existing, show how the art of plaster-work advanced in her reign. Some slides were shown of Hardwick, in which the plaster is in good condition, although exposed to the air ever since its execution. Slides were shown of ceilings in the drawing-room and ball-room at Haddon, 1545; Nelson's room at the Star and Garter Hotel, Yarmouth; Windsor Castle, 1599; the long gallery at Powis Castle, 1592; and another room at Powis dated 1593, and the main points of interest were pointed out by the lecturer. An interesting example of parge work, supposed to have been executed at this time, from a house at Wivenhoe, Suffolk, was shown.

During the reigns of James I. and Charles I., the work of the plasterer continued to flourish, and much important plaster decoration was done at about this time at Knowle, Audley End, and Broughton, and many other houses throughout the country. The long gallery at Knowle, dated 1605, was shown, and the lecturer remarked that it was one of the best known ceilings in the country. Other examples were shown, including some from Bishop King's house at Oxford; Merton College Library, Oxford; Audley End, 1615; the Reindeer Inn, Banbury; and Aston Hall, 1635.

About this time a new development takes place in the treatment and details of ceilings. Inigo Jones introduced a new treatment, more architectural and on a larger scale. He broadened out the ceiling rib, and made the large coved cornice a feature and a large recessed panel in the centre. Examples were shown from Coleshill, Berkshire; Ashburnham House, and Wilton House. The next figure that stands out as clearly defined in his period as Michael Angelo did in his, is Sir Christopher Wren. The fire of London, which gave him such opportunities, also marks a further development in the design of plaster ceilings. The ceiling from the New River Co.'s board room was shown as an example of his work. The lecturer here showed some more examples of parge work from Prittlewell, and Sparrow's house at Ipswich. Wren's work was followed by Sir John Vanbrugh, who built Blenheim and Castle Howard. Then came James Gibbs, who built the Senate House, Cambridge, 1772; and the Radcliffe Library, Oxford, at which point, the lecturer remarked, the work was getting more and more rococo.

The next period is that in which the brothers Robert and James Adam were most productive, namely, between 1760 and 1790. They placed a restraining hand upon the modeller, and kept his relief very low. These architects were followed by George Richardson, who followed on the same lines, and the art of plaster-work was dead and buried. With regard to present-day work, Mr. Turner said he was very certain that the art of the plasterer is only to be learnt through the system of apprenticeship. Without experience gained on work carried out for actual use, no one will ever be worth his salt, however many diplomas and medals he may have won. There is a great deal for the man to learn who works in lime plaster. He should be taught to model, and the modeller to plaster. In conclusion, the lecturer expressed a hope and a belief that we have a young and healthy decorative plasterer growing up among us. Let us do our best, he said, to bring him up in the way he should go.

Mr. H. Phillips Fletcher, F.R.I.B.A., the architect to the Carpenters' Company, who took the chair, in proposing a hearty vote of thanks to the lecturer, said that from his experience in different parts of the world, he believed that the British craftsman, when given the time and the opportunity, was still the best in the world, but that owing to the stress of modern conditions the men had fewer opportunities than heretofore. We all owe a debt of gratitude to the Carpenters' Company for stepping into the breach and trying to neutralise to some extent the decadence of apprenticeship by the establishment of their craft schools and the founding of lectures by eminent craftsmen.

CONTRACTORS' SECTION.

(MONTHLY.)

SOME PROS AND CONS OF THE INTER-TRADING RULE.

(*Contributed.*)

The Editor is not to be held responsible for the views expressed in this statement of the pros and cons of the Inter-trading Rule. At the same time he wishes it to be distinctly understood that this disclaimer is entirely without prejudice to either side of the argument. We shall be pleased to receive opinions on the subject.

The Master Builders' Association of Birmingham has recently decided to introduce the Inter-trading Rule, and the members have altered their rules to enable the scheme to be carried out.

The alteration was not made without a considerable amount of opposition; in fact, the resolution to introduce the rule was only carried by a majority of two. This, however, is double the majority by which a similar resolution was carried at Liverpool, where the rule has for some time past been in operation, and is working most satisfactorily, many of its former opponents being now among its strongest supporters, as they find that their association has increased in numbers, strength and financial resources.

Many of the Birmingham opponents were more opposed to the wording of the rule than to the principle of inter-trading. It certainly must be acknowledged that the wording is unfortunate, and open to criticism through its meaning not being sufficiently definite, and therefore liable to a wrong construction. It reads as follows:—

"Members shall not give or take tenders for any work to, or from, any persons who are not members of this or kindred associations connected with the building trade, and shall not employ such persons to do work for them."

Now, if taken literally as above, the rule apparently prohibits members from giving to, or taking tenders from, any but their fellow members. If this were so, it would not only be "inter-trading," but *exclusive* trading, more exclusive even than the co-operative movement, as members could only trade among themselves and do each other's work.

This, of course, is a *reductio ad absurdum*, and carries its own condemnation on its face, for though the rules *say* members shall only give tenders to other members, even the most stupid ignoramus or a judge over-particular as to the wording of rules and laws could not help but acknowledge that such was not the intent of the rule, otherwise builders who were members would be unable to submit tenders to architects or the general public.

The principal objections have been made by sub-contractors, whose position under the rule is not made particularly clear.

Of course, one of the primary objects of the rule is to induce all sub-contractors, as well as main contractors, to become members of the Master Builders' Association. As far as becoming members and paying their subscriptions is concerned, very few sub-contractors would object, but reading the rule as it is written, many have been under the impression that if they became members of the association they could not supply tenders to, or do work for, anyone but members of the association. This, however, is not the case; the rule really intends that they shall not act as sub-contractors to builders who are not members of some recognised association.

Of course, it would be impossible to persuade a person who does a considerable trade with the public direct to join an association if his doing so necessitated his giving up his ordinary trade. Let us take the case of a painter and decorator, for instance, who does a large private business in addition to taking sub-contracts from builders. Probably he would have very little objection to paying his subscription to the local association, but if on reading the rule that members shall not give tenders to any persons who are not members of the association he conceived the idea that he must either give up his private customers—as they are not members of the association—or the members of the association must refuse to accept tenders from him, he would doubtless hesitate before becoming a member; but as already explained, there is no intention of interfering in any way with his private business.

A suggestion was made some time ago as a good subject for a cartoon on the wording of the rule: A ragged little urchin addressing the proprietor of a joinery works and saw mills, says, "Please, sir, muvver wants to know how much saw-dust you can give her for a ha'penny?" The saw-mill proprietor replies, "Before I can give you a quotation, my boy, I must assure myself that you are a member of the local Master Builders' Association or of some kindred association affiliated to the National Federation." Of course, the whole point of this joke would be lost if the rule had been explicitly worded, instead of stating that members of an association shall not give tenders to *any persons* who are not members of some kindred association.

Another difficulty raised through the rule stating that work shall not be given to any non-members, was as to how far the rule could be carried. For instance, let us say the contractor has persuaded his sub-contractor, the painter and decorator, to become a member of the association. Now, it can be argued that having become a member, if he is to carry out the rule in its entirety, he must accept tenders only from other members, consequently he in his turn must persuade his paint merchant to become a member, also then the merchant must persuade the paint manufacturer, the manufacturers must persuade the colour makers and the oil producers, the colour makers must persuade the owners of the various coloured earths and chemicals from which the pigments are made—and so on. Then the railway company who carries the paint for the sub-contractor, and the haulier who carts it from the station must also be members, otherwise the sub-contractor, according to the rule "shall not employ such persons to do work for him."

But though the wording of the inter-trading rule is open to this argument, it is assuredly not the intent of the rule, which is to a certain extent qualified by the rule which follows, and refers to merchants becoming honorary members. Further, it may be definitely stated that the inter-trading rule is intended to be that which its name implies, viz., a rule for the inter-trading between contractors and sub-contractors without in any way interfering with their business among the general public.

It is to be regretted that the rule has not been more carefully worded, so that this fact might have been definitely expressed. It would not have been open to so much criticism and argument, and would have been definite and better understood had it read as follows:—

"Contractors who are members of this Association shall not take tenders from any sub-contractors who are not members of this or a kindred association connected with the building trade, and shall not employ such persons to do work for them, and sub-contractors who are members of this Association shall not give tenders to or do work for any contractors who are not members of this or a kindred association affiliated to the National Federation of Building Trade Employers."

There is, however, a real difficulty, and in fact the only difficulty, in the case of the "specialist" in some particular branch of the building trade—say, for instance, a hot-water engineer who refuses to become a member of any association. What will occur if an architect specifies that this particular man is to provide the heating apparatus for some contract which a member of the association has obtained? According to the strict reading of the inter-trading rule the builder would not be allowed to take a tender from him or employ him to do the work. On the other hand, let us suppose the hot-water engineer is a member of the association, and the sole agent for the patentee of some particular system of heating which has been specified, and that the contract has been obtained by a contractor who refuses to become a member of the association. If the hot-water engineer is to be bound by the inter-trading rule he would be compelled to refuse the non-associated contractor a tender, in which case he would soon find himself in hot water with the principal for whom he is agent.

It has, however, been stated that for the present all such instances shall be exceptions to which the rule shall not apply, being matters over which the members of the association have no control, and that further than trying their best to persuade the parties to become members they shall not be expected to go.

Such instances, however, will be rare, and may practically be ignored—at any rate until they appear, when each case would be treated on its merits.

If the spirit of the ideal inter-trading is carried out with reasonableness and loyalty, without taking too much notice of the strict wording of the rule, it will doubtless prove extremely beneficial, both to contractors and sub-contractors—sub-contractors will be induced to join the association, knowing that unless they do so they will not be asked for tenders by members of any association, who, after all said and done, form the majority of the builders both in numbers and influence, there being very few really large contractors who are not members of some builders' association. Further, the few contractors who have not yet done so, who have stood aloof without taking their fair share of the work and expense of the associations, though benefiting equally with those who have provided the funds and given their time—by the arrangements made with architects and with workmen for the betterment of the trade and the conditions of working—will be induced to join, knowing that unless they do so they must carry out the whole of their contracts themselves, or be satisfied to receive tenders from the limited number only of sub-contractors who are not members of some builders' association. Thus the associations would gain in numbers, in power, in influence, and in financial strength, and would then be in a far better position to negotiate with architects and with workmen for the introduction of many still needed reforms.

From the fact that the inter-trading rule has been carried out at Liverpool and other places for some time past without any friction, we may conclude that the committee responsible for its working have been moderate, and have used persuasion rather than force to carry out their desires, otherwise the rule would have caused a revolt, and brought about the ruin of the association, considering that there were originally so many opponents to it, and only a majority of *one* in favour of its adoption at Liverpool.

It is certain that there is nothing that an Englishman demands more strongly than liberty to carry on his own business in his own manner, and though the present wording of the inter-trading rule, until properly explained, apparently curtails that liberty, it is certain that in practice such has not been the case, consequently we can welcome with pleasure the continual introduction of this rule and its rapid spread among the various associations, feeling confident that the Birmingham committee will carry out the rule as judiciously and as reasonably as the Liverpool committee have done, and that now the Birmingham Association has followed the example of Liverpool, and decided to introduce it, most of the other Midland associations will do likewise.

ASCERTAINING THE VALUE OF FIRE BRICKS AND BLOCKS.

By Alfred B. Searle.

For reasons which it is difficult to explain, most users of firebricks appear to have very vague ideas as to the special characteristics which these useful articles should possess, and if the truth could be ascertained it is not at all improbable that many builders purchase their firebricks and backs for fireplaces for reasons which are wholly inadequate for distinguishing a low grade article, offered at a high price, from a first-class brick which may be purchased at a much lower price.

Are there any simple means by which a builder can tell the value of a firebrick without much expense? If so, it would pay him to employ such simple tests, as he would thereby save a considerable amount of money, more particularly when requiring only second-class firebricks for a particular purpose.

In the first place, it is not wise to place much reliance on the colour of a firebrick, for these articles are made for resisting heat and not for ornamental purposes, and even a badly discoloured firebrick can be whitewashed over after it has been built into position, if its appearance is of importance, as in a fireback. It is a fact, though few builders and users of firebricks appear to be aware of it, that the more discoloured a firebrick—in certain respects—the greater is its probability of resisting high temperature without shrinking. The reason for this is not difficult to understand.

A perfect firebrick would be composed of a perfectly pure clay, and would be entirely free from such fusible matter as felspar, and from such staining ingredients as iron compounds. No commercial clays used for the manufacture of firebricks are perfectly pure, and, consequently, when heated, the staining power of the iron compounds they contain is developed roughly in proportion to the temperature. Thus, a brick fired at a comparatively low heat during manufacture will be of a beautiful buff colour, without a stain upon it, yet the same brick heated to a point where it has ceased to shrink, on further heating at slightly higher temperatures may be covered with small irregular black patches and spots. Is the brick improved or spoiled by this additional heat to which it has been subjected?

From the point of view of appearance, its beauty is certainly diminished, and for ornamental purposes such a discoloured brick would be useless. For heat-resistance, on the contrary, the brick is improved. It is more closely knit together, its possibilities of skrinkage are reduced, and a rough but fairly certain sign of its power of heat-resistance is shown by the fact that it has already been highly heated, as shown by its "scorched" appearance. The nicely-coloured brick may be refractory, the ugly, spotted one is almost certain to be so.

By simple observation, it is thus possible to reject as "doubtful" all bricks which are suspiciously "clean" in appearance. The fact that they are so free from discolouration suggests that they have been fired at a comparatively low temperature, and whilst the makers may urge that this is done to save fuel, the wise user will prefer to select bricks which bear clearer marks of suitability for his purpose. He will not be misled into mistaking undeveloped defects for a sign of purity.

If a firebrick has large patches of black, or almost black matter of a slag-like nature on its surface, it may be regarded with suspicion, though for domestic architecture it will probably be of sufficient heat-resisting power. Nevertheless, a brick must be intensely darkened over almost its whole surface before the amount of impurity of a pyritic nature is so great as to materially affect its usefulness except in the case of bricks required for use with the highest temperatures.

The testing of firebricks to ascertain the point at which they are unsuitable for use on account of their becoming softened by exposure to heat is too delicate and difficult a piece of work to be undertaken by an ordinary builder, and, indeed, it is unnecessary except for those engaged in furnace construction and similar work. In any case this test can be made for a small fee by chemists who have been specially trained in the testing of refractory goods. Most firebrick manufacturers are quite willing to answer the question, "What will your bricks stand?" but many of the answers usually received are not borne out by actual test.

One reason for this is the existence of two scales of temperature—the Fahrenheit and Centigrade—and as a given temperature is represented by a number nearly twice as large in one case as in the other, it is not difficult to understand that a commercial traveller may forget which he is using. Thus many firebricks will stand exposure to a bright red heat corresponding to 1,650 Cent. without softening—a temperature equivalent to 3,000 Fah., but if a man states that his bricks will stand exposure to a temperature of 3,000 Cent. he at once places himself outside the limits of belief. Yet so hazy are the notions of many firebrick makers' representatives that great caution is necessary before their figures for the fusion point of their goods are accepted.

The behaviour of a brick under sudden changes of temperature is a matter of great importance in many cases, yet this is a characteristic which is peculiarly difficult to test. The rough method of pouring cold water on a red-hot brick is too severe for some purposes, and not by any means accurate enough for others. Fortunately, the temperatures met by most builders are not sufficiently great to make spalling a serious difficulty, though in connection with steel furnace construction it is of the greatest moment. It is most noticeable in bricks rich in silica.

Cracked firebricks and side dogs are a frequent cause of enquiry amongst householders, and the builder, for want of a better excuse, usually tries to explain that all firebacks crack with the heat, he being apparently quite oblivious of the fact that many do not crack, even after several years of constant use. When once a fireback has been constructed, there is no simple test which can be applied (without risk of spoiling it) though much may be gained from a close examination of the material. The more porous the material the less danger is there of its cracking; a dense back is almost certain to "fly" at the first time of heating.

The source of the clay from which firebricks are made is the best criterion as to its quality, though for domestic purposes it is often quite satisfactory to use bricks made from a local bed of what may be regarded as inferior clay, or from a mixture of clay of low heat-resistance and one of great refractoriness. Such mixtures are very common in certain parts of the Midlands and north-west. These "third grade firebricks" are often boomed as though they were superior to others made of the best materials, and as long as their price is reasonable there is no need for higher grade bricks to be used. It must however, be understood that when the greatest possible heat-resistance is required in a firebrick it is necessary to take elaborate precautions that only clays of the best class are employed in its manufacture, and that the moulding, drying, and burning of the bricks are carried out with the necessary skill. Such first-class firebricks are expensive, but for their special purposes they are undoubtedly the best. For work where the temperature is only moderate, as in a domestic fire-grate, a lower grade of brick is equally suitable.

Delicate measurements of the relative weights of different firebricks are beyond the facilities possessed by the ordinary builder, though here again a rough observation is of value. With two bricks of precisely the same size, the lighter one, being less dense and, therefore, more porous, will probably be the most suitable for moderate heat-resistance. The temperature of an ordinary coal fire, for instance, is so far below the lowest temperature at which a refractory brick worthy of the name will soften, that the actual highest temperature such a brick will stand is of small importance compared with its durability under the conditions existing in an ordinary open fire. It not infrequently happens that a clay with a low fusion point may prove more durable for such a purpose than one of greater ultimate refractoriness, but less able to withstand the constant heating and cooling.

On this account many makers of firebricks and blocks mix sawdust with their clay, thereby making it lighter and more porous and so better suited for their intended purpose.

In purchasing firebricks, blocks, or firebacks for ordinary domestic buildings, the builder should see that they are light and porous, but should pay little attention to colour or to small black spots, except to regard them as signs of high temperature during manufacture, and as a sign of the manufacturer's confidence in the heat-resisting power of his wares.

NOTES ON PAINTING AND DECORATION.

The use of hand-stencilled friezes previously noted in these pages appears to be firmly established. Probably one reason is that they may be, and usually are, made specially for the room in which they are to be used. The work of stencilling by hand is done in the wall paper factory. Stencils made of very heavy copper are employed for the purpose, and the architect or decorator supplies the maker with a dimensioned sketch of the room, so that it is easy to place the stencils a little closer together, or further apart, as may be necessary to distribute the ornament nicely over the particular length of the room. These goods are not always expensive, although of course they cannot be considered cheap; but imitations, not altogether bad, may be had at very smaller prices. The actual stencilling is done by means of a large brush, measuring perhaps 4ins. across. This is fully charged with colour, and the workman is very readily able to graduate the colour by the simple means of pressing heavily when he wishes it strong, and gradually relaxing the pressure when he wishes to transfer less colour to the surface. Perhaps, however, the easiest and best means of obtaining a graduated effect, not only in stencilling work, but in all schemes of decoration, is to use that most ingenious little instrument known as the "Aerograph," by which colour is sprayed on to the surface. Many beautiful effects may be obtained by the use of this tool, which is now used to a considerable extent in most wall-paper factories, as well as by a great many of the leading decorators. Sponges, too, are used in hand-printed papers, to "wipe in" the colour, so to speak, and a combination of the stencil, the "Aerograph," and the sponge processes produces a result wholly unknown a few years back.

The charm in stencilled and other friezes depends to no small extent upon the surface which is used. Paper, of course, is largely employed, but many other materials are available. Coarse canvas, such as "Fab-ri-Kona," is now used extensively for decoration of dining and other rooms, picture galleries, etc., and is often employed perfectly plain for the walls, with a stencilled ornament on the frieze. The rough texture, which may be crudely described as a coarse sacking specially treated, breaks up the ornament, and, viewed at a distance, gives a very

artistic effect. Then Japanese grass cloth gives some very beautiful effects; while there is a very great variety of linen and other fabric papers, and metal effects, which may be used with good results for the same purpose.

Colouring Exteriors.

The question of how far colour should be used on the outside of buildings is one which has long been debated. Probably we use colour less than most other nations, although it would appear to be desirable to endeavour to brighten up our streets to some extent by the introduction of colour judiciously used. We have frequently called attention to the extensive use of stone colour, which is such a feature in London, although neutral greens, reds, and other colours may be employed with much better effect, even on old cement-faced houses, provided that care is taken to prevent their being too "muddy" on the one hand, and too glaring on the other. In ordinary brick buildings, there is not much left to paint excepting the sashes and the front door. If the frames are put in in black, or chocolate, and the sashes painted in white enamel or white zinc, the effect is usually very good, particularly when the sash bars are prominent. There is room for an increase in the use of the well finished front door. One now frequently comes across, in the West End, doors which are painted in rich deep reds, greens, blues, or browns. Such a door, properly finished, serves to brighten up the entrance; and if the surrounding woodwork be put in in white the result is always pleasing. If the door is an old one, with more or less elaborate moulding, the effect is even better. There is no difficulty in finishing doors in this way, and, considering how well they look and how long they last, they are cheap. The old paint-work must be stripped to the wood, and the surface be very carefully made smooth; any imperfection in this respect will spoil the finish. Three or four coats of paint are then given, each one mixed with much less oil than is usual when the work is to be finished without varnish. In fact, the best plan is to apply a coat quite flat, without any oil, other than that which is used in the grinding of the colour, a little gold size being added as a binder. The next coat can have just a little oil in it, so as to dry semi-flat; the next two should be quite flat. When dry, the surface should of course be rubbed down with very fine sandpaper before the next is applied, care being taken that no dust is left on the surface; then two coats of really good varnish complete the job. The varnish used should be that which is sold as "front-door varnish," for although it is somewhat expensive, the quantity required for a door is so small as to make this immaterial. The varnish treatment can be varied when more than one coat is to be used, by using for the first coat a rubbing varnish, and when dry rubbing it down with very fine powdered pumice stone and water, taking care to wash off thoroughly with chamois leather before the next coat is applied. If this is not done, the surface will show up gritty. A door finished in the manner described will last for many years, and if a suitable colour is chosen, will give just a touch of decoration to the front door which otherwise it would be difficult to obtain.

Paint Solvents.

In speaking of removing paint in a paragraph above, one is reminded of the great advance which has been made in recent years in the production of paint solvents, or removers. The old-fashioned system of using a torch, or charcoal fire, is still, of course, largely employed, but the objection to it is that disagreeable fumes are given off which are absolutely injurious inside the house; and then there is the danger of fire, and also the danger that a careless workman may burn through some of the finer mouldings. Paint solvents have been available for many years, and until comparatively recently they consisted of caustic lime and soda. The objection to this class is that the mixture is "sloppy" in use, and unless great care is taken to neutralise any of the alkali left on the surface after the paint is removed (which is done by applying a little vinegar and water), the subsequent coats of paint will be seriously affected. The next class of paint solvent consists of such materials as benzole, acetone, alcohol, etc., frequently mixed together. Their disadvantage is that when used on the outside they evaporate so quickly as to necessitate a considerable quantity of the spirit being used, with the result that the process becomes expensive. Some five years ago a patent was taken out for a paint remover, consisting of the usual benzole, etc., to which is added paraffin, Japan and Carnauba wax. This forms a thick coat which prevents the spirit from evaporating, and causes the paint to become softened in a very short time, depending, of course, upon the number of coats, and the age of the work. For ordinary three-coat work, probably ten minutes would suffice to soften the paint so considerably that it can be readily scraped off the surface, which is then rubbed over with a piece of rag dipped in benzine or turpentine, and is then ready for repainting. This class of paint-remover the writer looks upon as the best available, and its use is steadily increasing.

The Glazing Process.

Sometimes one has been asked how the particularly rich effect in coloured work, such as that just described, is obtained. The answer is by the process known as "glazing," which means that rich transparent colour is applied over a solid one of a more sombre hue. A good example is to use Indian or Venetian red for painting the door in three or four coats, perhaps a little lighter in the stiles and rails, and obtain the desired rich effect by giving a final coat of crimson lake or madder lake. These colours being somewhat transparent, the Venetian red shows through and forms a solid ground, while the brilliance of the lake is toned down at the same time. An almost infinite number of effects may be obtained by this process of glazing, and the subject is well worth looking into by those who have not previously studied it.

Zinc Oxide and Lithopone.

A lecturer at the Regent Street Polytechnic recently drew attention to the importance for architects, builders, decorators, and others of distinguishing between two pigments, which are both unfortunately referred to under the same name, viz., "zinc white." The two pigments are, rightly, zinc oxide and lithopone or sulphide of zinc. In view of the increased use of zinc paints generally, it may be well to point out here the difference between the two. Until about twenty-five years ago, the term zinc white always meant one material, zinc oxide, and many to-day so regard the term. A new pigment was, at the time mentioned, introduced, consisting of zinc sulphide and some seventy per cent. of precipitated or artificial barytes, with sometimes a small proportion of zinc oxide. The barytes in this case was practically the same as "blanc fixe," and should not be confused with ordinary barytes, which is used as an adulterant of lead. Moreover, in the lithopone the chemical constituents are precipitated together, and form a necessary part of the paint itself. Now as to the difference between the two. Zinc oxide is made by burning metal zinc (known as spelter), which converts it into vapour; and on this vapour being cooled, the zinc oxide of commerce is the result. There are various grades of zinc oxide; the best is pure white, far whiter for instance than white lead. Zinc oxide has no poisonous properties whatever, being absolutely innocuous. When ground in oil, it does not form an emulsion, or soap, as is the case with lead. Being practically inert, it forms a very durable paint, and has the valuable property of spreading over a surface much greater than lead, say, from 25 to 33 per cent. greater, so, although it is usually a little more expensive than lead, when its spreading property is considered, it really becomes rather cheaper. It is not affected by sulphur fumes, which abound in all large towns. A great many people seem to think it can only be satisfactorily used for inside work; as a matter of fact, it is one of the most durable paints for outside work. The reason for this popular error is readily arrived at. It is the lithopone or zinc white which is only suitable for inside work, and for that purpose a very cheap paint it is. It is the base of the best water paints on sale, and may be used with perfect satisfaction, but never outside, where it has a tendency to change colour, a defect which zinc oxide is wholly free from. During the last few years a propaganda has been carried on on a modest scale in favour of zinc oxide, and it is curious to note that architects and engineers who have looked into the question are still divided in opinion on the subject, and for a reason which may be summed up in the phrase "Once bitten, twice shy." An engineer of the writer's acquaintance became strongly opposed to zinc oxide, because he had, or he thought he had, used it on a large job, and it turned out very badly. On investigation, it was found that the paint he had employed was not zinc oxide at all, and it has been found in every case that has been closely investigated, that the same conditions existed, except perhaps that when zinc oxide has been employed and turned out badly, the mixing had been improperly done. Painters are a very conservative class of men and appear to think that because white lead is mixed by adding a quantity of patent driers, linseed oil, and turpentine, every other paint should be mixed in the same way, which is, on the face of it, absurd. Zinc oxide is bought very finely ground in linseed oil to a strong paste, and is made ready to use by thinning with refined boiled oil and very little turpentine, and no driers, except in bad weather, when a little zinc driers may be used.

Flat Enamel Finish.

Although raised paper of the series of beautiful relief decoration goods known as "Anaglypta," "Cordelova," etc., justly enjoy a very large sale, plaster work will always be employed in high-class buildings, because of the beauty of its finish. One can often notice that a beautiful ceiling made of "carton-pierre," with a plaster finish, is finished in distemper. This is all right for the first time; but when the ceiling becomes dirty, as of course it must do in time, and it is necessary to distemper it again, there is always the probability of the undercoat of distemper not being properly washed off, which means that the sharpness of the detail and the principal item of beauty of the ornament is therefore lost. Few decorators seem to recognise that by far the best way of finishing such ceilings is to use flat enamels, which may be had in white or pretty well any colour required. They dry quite free from gloss, and give all the appearance of distemper, excepting that they may, if necessary, be scrubbed, and the coat being very thin, there is no likelihood of the sharpness being lost, as when distemper is employed. Flat enamel may be used also with excellent effect in panel work in conjunction with glossy enamel on the stiles, rails, and mouldings; and, indeed, the two together produce very pleasing results.

Vermilion Substitutes.

One of the most ancient pigments known —namely, vermilion, appears to be very likely to disappear before very long, for the simple reason that substitutes that are just as permanent, and much cheaper, have been produced by the efforts of modern chemists. There are dozens of kinds of brilliant reds in various shades that may be had that are unaffected by acid, alkali, or sulphur, and are practically permanent, that is to say, as permanent as vermilion would be if exposed under similar conditions. The one disadvantage of many of these reds is that they are liable to "bleed," by which is meant, that if a coat of another coloured paint is applied over them, some portion of the red works through and shows up in small red specks, which suggests spots of blood. There are now at least two or three different kinds which have now been produced entirely free from this deficiency, and some experiments recently made show these to be quite reliable in this respect, while they have remarkably good body, or opacity, so that even a single coat covers the woodwork completely. In the majority of colours, too, there has been very marked improvement. Every reader probably has noticed how often greens when used outside fade after having been exposed for a year or so, the yellow in the green appearing to disappear, leaving the colour almost blue. The greens which are mostly subject to this are those known as "Brunswick greens," which are a cheap class of colours, but are used very extensively. Greens are now made that may be looked upon as permanent, and can be had in a variety of shades at a very small advance of price over the old-fashioned Brunswick greens. J.

PAINT & ITS APPLICATION TO STRUCTURAL STEEL

By Gaston Depierres.

Abstract of a portion of a paper read before the Paint and Varnish Society by Mr. Gaston Depierres, Vice-president.

What I am about to say is largely from a paintmaker's point of view, and is the direct result of study recently given to the manufacture and properties of structural steel, and the use of paint in its preservation. I therefore venture to hope that it may be of some interest to both paint manufacturers and paint users.

Flaws, Rust and Grease

are things that may destroy the work of the painter. No surface of structural steel ought to be coated with paint unless it shows the greyish-white, natural colour of the metal, and is absolutely free from traces of adherent acids and moistures. Yet, when unsatisfactory results are obtained, the paintmaker is generally the first one to be criticised, though most probably he has applied a perfectly good and suitable paint. Steel is perhaps the most tenacious of all known substances, having great cohesive force between its particles, so that they resist any effort to pull or force them apart; and as we fancy all matters to be in a state of motion at all times, the difficulty in preserving it by the use of paint is at once apparent. The defects in modern structural steel are largely due to mechanical working; that is, it is run out too hot or too quickly, and afterwards not properly housed and cared for. The enormous increase of late in its use in building and engineering construction demands increased vigilance and attention to its maintenance and present condition wherever it has been placed; as, either from corrosion, fatigue, vibration, or general deterioration, the metal may become so impaired as to be unfit to do that for which it was designed; and unless it is properly protected by coatings of paint at various periods, those entrusted with its care will assume the enormous responsibility of further catastrophes, entailing great expense, and, worse still, shocking loss of life.

Nature of Rust.

Notwithstanding what has been said by the eminent men who have treated this subject, practically only from the chemical point of view, I venture to say that to paintmakers and painters rusting must be understood to mean atmospheric oxidation and not corrosion by other agencies. Consequently, apart from chemical agents, water and oxygen are the primary causes of rust, with the contributory influence of atmospheric carbon dioxide (carbonic acid). Rust is hydrated oxide of iron; that is, a compound of the metal iron with oxygen and water; 100 parts ordinary iron rust, containing 52 parts of iron, 22 parts of oxygen, and 25 parts water. Water is here in a state of chemical combination, and not a mere mechanical adjunct in the form of moisture. Wherever rust has once formed, its further occurrence is a natural sequence; and its prevention becomes more difficult—in fact, impossible—unless the affected places are perfectly freed from all traces of oxide. So far from being a solid, coherent mass, rust is loose and porous, absorbing and persistently retaining water, which, with the help of atmospheric air, assists in the conversion of such portions of the iron which have hitherto remained intact.

Rust has a tendency to grow and spread out from a centre; hence a small spot of it on the metal extends itself under the paint, so that in time the paint will be flaked off, and the metal will have expanded. It is therefore essential for the proper upkeep of the steel structure that all rust-spots, of whatever nature, should be as early as possible prevented from spreading; and to this end they ought to be repaired at once, without waiting for all the old paint to disappear before laying on an entirely fresh coat all over. It is a remarkable thing that a speck of rust will sometimes strike through a coat of paint like a smoke stain through distemper in a ceiling; and this is, of course, more visible when white paint is used. When this is dry it is seen that the rust has turned the paint yellow.

Rusting Agencies.

I hardly think that we can accuse the oil or varnish, but am of opinion that it is most probably due to a certain percentage of water in a good many paints, though, of course, in a well-prepared paint, this should not be the case.

Various authors have advanced the theory that electrolytic action is one of the agencies for rapid corrosion. Like all other chemical reactions, rusting is no doubt accompanied by electrical tension, set up in the affected objects. This appears to me to be practically proved by the fact that in large steel structures the maximum amount of corrosion is to be found where two pieces of steel are attached together; this is especially noticeable round the rivet-holes, bolts, and nuts; hence the necessity for greater care to be exercised in their painting.

It is not by the massive pieces of an iron bridge, such as girders, stays, ties, and large visible portions, that the strength of the entire structure should be measured, but rather by the soundness of the numerous smaller component parts uniting the larger ones. Davy's discovery that steel knives and other articles can be protected from rusting by strips of zinc has led me to make various experiments in that direction; but I regret to say that I have been unable to obtain from them concordant results which might have helped to put this theory in practice in the preservation of structural steel.

An Important Point

to be noted in the formation of rust is the increase in volume of the iron concurrently with the progress of the rust formation. Ironwork embedded in fresh mortar or set in brickwork soon becomes attacked at the surface, and gradually the corrosion extends towards the interior—a circumstance that may become a great danger to the structure; and yet I notice almost daily all over this great city thousands of tons of steel girders being embedded without a particle of paint, or with a miserable coat of shop-paint given for appearance sake only, and having no protective value. Yet engineers and architects are supposed to draw proper specifications to protect their clients, and district surveyors are appointed to see on behalf of the public that structures are sound; but in many cases they seem to be unaware of the fact that in not insisting to have the steel structure carefully protected by several coats of paint, they assume the responsibility of many accidents and catastrophes which may happen in years to come.

The Cleansing of Steel.

The cleaning of structural steel is a problem for engineers, and yet how few have seriously set their mind to solve it in a logical and practical manner. Specifications are often very loose with regard to the manner in which the cleaning should be done before re-painting; when, as a matter of fact, no clause can be stringent enough, no inspection by the clerk of the works too minute, when the importance of the cleaning of steel before the application of paint is taken into consideration. Several methods are at present employed:—First, scrubbing or scouring with hard substances, such as pumice-stone, emery, etc. Secondly, scrubbing with wire brushes, and chipping with chipping hammers or steel scrapers made of old files; thirdly, pickling with acids; fourthly, cleaning by the sand-blast process.

The first method,

Scrubbing and Scouring,

cannot be recommended, as it offers the great disadvantage that it necessitates the employment of water or petroleum oil, which are often used to facilitate the removal of the iron rust. It is highly probable that this is the cause of many failures, since the labourers generally entrusted with the cleaning of ironwork can hardly be expected to know the meaning of absolute dryness. When this method is employed, a hot blast from a blow-lamp should be applied to the surface of the iron, to remove all moisture or burn off all traces of petroleum oil from its surface; but, unfortunately, this is seldom, if ever, put into practice on account of the expense of it. The pickling with acids is undoubtedly the process by which a thousand times as much new iron and steel is cleaned as by any other process. All work that is to be electro-plated, for instance, or that is to receive a coat of vitreous enamel, is cleaned in this way. No doubt an efficient cleaning is obtained by pickling in hot sulphuric acid or muriatic acid; but unless one is well prepared to neutralise thoroughly, and remove all traces of acid from the metal immediately after it is taken from the "bath," the result will be disastrous. Of all methods the cleaning by sand-blast seems to offer the most rapid, effective, and conomical means of preparing structural steel to receive a coating of paint. It leaves the metal not only perfectly clean, but dry, an important and essential condition if a receptive surface is to be secured. The painting of the metal should follow immediately after the cleaning, as the cleaning of the steel by this process roughens its surface slightly, and it is well known that under such conditions surface corrosion rapidly sets in.

It is argued that one of the disadvantages of

Sand-blasting

is the deleterious effect upon the eyes and lungs of the operator. This, in my opinion, can easily be overcome by means of suitable respirators, various kinds being now obtainable which would ensure complete immunity on that score. There is no doubt to-day that sand-blasting certainly offers the best means of cleaning old structures which are very rusty; and now that air-compressors, small oil engines, and electric motors of a portable kind are available, it is fair to presume that steel coatings will have better opportunities in the future to prove the life there is in them than they have had in the past; if the example that has been set before us by America for some years past is followed in England—to wit, the adoption of the method of cleaning by sand-blast.

Paint-making, and the Painting of Steel.

At one time paint-making was an art, then it became a trick, now it is a science. To-day paint-making has been rescued from the domain of empiricism, and has become an exact science. One skilled in it can now practise it with a certainty of results in exact proportion to his knowledge of its principles, and his ability in applying them to the work in hand. The theory that oil, or the binder, is the life of paint—that is to say, the thing that makes it wear—is to a certain extent misleading, and has been the cause of many of the blunders and failures with it in the past. I venture to say that an excess of linseed oil in paint is nearly as much an adulteration as the introduction of a useless or harmful pigment. We work upon the hypothesis that solids are co-efficient with the liquids in producing the best materials; and that the secret—if there be any—lies in the proper adjustment of the amount and kind of each needed to secure a perfect product.

(*To be continued.*)

THE FEDERATION WHO'S WHO.

Photo: Ruddock, Ltd.

Mr. STEPHEN EASTEN, President of the Northern Centre.

Mr. Stephen Easten was born at Lowick, Northumberland, and served his apprenticeship as a joiner at Norham-on-Tweed. He began business on his own account in Newcastle in 1888. Having been elected in January, 1906, by the Ward of St. Nicholas, as a member of Newcastle City Council, he was appointed chairman of the Estate and Property Committee in March, 1908. Mr. Easten, who is a past president of the Newcastle and District Building Trades Association (1906 and 1907), and of the Northern Counties Federation, is now President of the Tyne and Blyth District Building Trades Federation, and was appointed president of the Northern Centre of the National Federation in January, 1909. Among the large contracts executed by his firm (Stephen Easten, Ltd.) in Glasgow, are the Newcastle Corporation power station and offices, the Cathedral buildings, Milburn House, the Scottish Provident buildings, etc.

Photo: Stanley & Co.

Mr. JAMES DENVER, Secretary of the Northern Centre.

Mr. James Denver, of Manchester, entered the offices of Mr. John Tomlison, Manchester, in a junior position, in June, 1900, and thus became acquainted with the building trades employers' organisation. Since then he has taken a keen interest in association work, and he was appointed secretary for the Northern Centre of the National Federation of Building Trades Employers at Birmingham in July, 1908 in succession to Mr. John Tomlison, resigned. Mr. Denver was further appointed secretary for the Employers' Section of the Northern Centre Conciliation Board, in September of last year, also in succession to Mr. Tomlison.

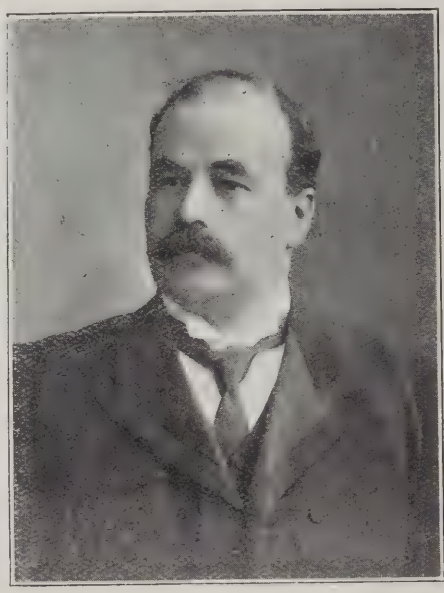

Photo: Medrington's, Ltd,

Mr. WILLIAM BULLEN, President of the Lancashire, Cheshire, and North Wales Federation.

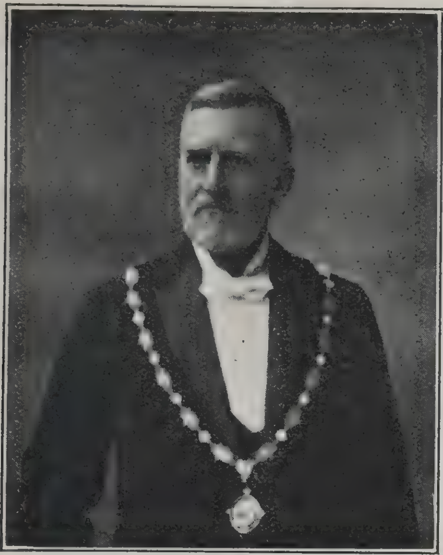
Mr. William Bullen, of Liverpool, rendered such excellent services to the Liverpool Association, that it was inevitable that he should be invited to accept the higher responsibilities involved in officially representing the Lancashire and Cheshire Federation. It was in 1894 that Mr. Bullen's firm joined the Liverpool Association, and he, as the active partner, at once took such interest in association business as marked him as an acquisition and as a future officer. He joined the Executive Council in 1902, in 1903 was elected a vice-president, and in 1905 became president. Here Mr. Bullen found ample scope for his energies, and he set himself to enlarge the membership of what was already one of the largest associations in the country. Ably seconded by the secretary, Mr. B. B. Moss, Mr. Bullen's efforts resulted in the addition of 114 new members during his year of office; and it is noteworthy that the president himself attended every one of the 62 meetings held. The members signalised their appreciation of Mr. Bullen's extraordinary success by electing him for a second term as president, this being the only occasion, since the association was formed forty-two years ago, on which such a distinction has been conferred. In his second year of office, Mr. Bullen had the satisfaction of seeing a further 101 new members added to the association, and again he did not miss a single one of the 81 meetings held locally. During this period he also attended Federation meetings in various places, and initiated a scheme by which the Mersey Federation, comprising the associations of Liverpool, Birkenhead, and Wallasey, was formed to secure uniform action in all matters affecting their mutual interests. On retiring from the presidency of the Liverpool Association, Mr. Bullen was presented with an illuminated address from the members; while to Mrs. Bullen, who ably seconds her husband's activity in public work, a silver rose bowl and vases were presented. As president of the Lancashire and Cheshire Federation, Mr. Bullen has continued to show the same productive activity, and he is carrying on an organisation campaign which will doubtless shortly show most gratifying results. Personally, Mr. Bullen infects those about him with an intense desire for achievement; but great as is his activity in this and other directions of public work, he looks upon such work as a relaxation and relief from the still greater energy with which he devotes himself to a large and increasing business. Happy the man who can make his "play" so useful!

Photo: Y. Burns.

Mr. JOHN TOMLISON, Secretary of the Lancashire, Cheshire and North Wales Federation.

Mr. John Tomlison was born at Preston, Lancashire, on August 10th, 1857, and entered his father's office at the age of fifteen, with the intention of following the business of a joiner and builder. Ill-health, which ultimately resulted in permanent lameness, caused his abandonment of this intention when he was about twenty-one years of age, and for the next twelve years he followed no occupation. In July, 1890, he accepted the secretaryship of the Preston Building Trades Employer' Association, then recently formed, with a membership of about thirty, and he has held the position until the present day. The membership has for a number of years averaged about 175. In 1894 he assisted in forming the old Lancashire Federation—the pioneer of the present system of national organisation—and he was appointed secretary in December of that year. When, four years later, an amalgamation took place with the Manchester, Liverpool and District Federation, under the present title of the Lancashire and Cheshire, he was appointed secretary of the reconstructed society. On the reformation of the old National Association of Master Builders, he was appointed secretary of the Northern centre council, and about the same time accepted the secretaryship of the Manchester and Salford Master Builders' Association, which, in conjunction with the Federation, opened offices in Manchester; Mr. Tomlison still continuing to reside at Preston. In 1904 he took an active part in the formation of the Federated Employers' Insurance Association, Ltd., to deal principally with building trade employers' risks, and for about two years he was one of the directors, resigning at the end of that period on account of differences of opinion with his colleagues. In 1904-5, Mr. Tomlison took part in the negotiations for the now established scheme of conciliation, intended to prevent strikes and lock-outs in the building trades, and on its adoption he was appointed Employers' Secretary of the National, Northern Centre, Manchester, and Preston Boards, but relinquished the secretaryship of the National Board about two years ago, and resigned the two Northern Centre secretaryships last year. Mr. Tomlison acted as secretary of the National Federation for a brief period during the interval prior to the appointment of Mr. A. G. White, but was prevented by a severe illness from attending the Dublin meeting.

NOTE.—The portraits of Mr. C. H. Barnsley, ex-President; Mr. Ernest J. Brown. the present President: Mr. S. Smethurst, Senior Vice-President. and Mr. A. G. White, Secretary of the National Federation, appeared in our Christmas Edition de Luxe.



Mr. W. R. THOMPSON, President of the Yorkshire Federation.

Mr. W. R. Thompson was born at Dewsbury in 1846, and commenced his business career by entering the office of his uncle, the late Mr. J. T. Rawsthorne, who was engaged in the stone, slate, and general building material trade, being also quarry owner and lime burner and slating contractor. Mr. Thompson gradually rose to be manager of the business, and in 1882 became sole proprietor. The business was established about 150 years ago, and has passed from uncle to nephew for three generations, Mr. Thompson being of the third generation. In 1880 Mr. Thompson paid a visit to Canada and the United States, visiting many of the chief cities, and going as far west as Winnipeg.

The deep interest which Mr. Thompson has always taken in association and federation work may be judged from the following appointments which he has held:—Yorkshire Federation, president 1908, treasurer 1899, 1900, 1901; National Association of Slate Merchants and Slaters, president 1898; president of Spen Valley and District Master Builders' Association; president of Spen Valley and District Accident Assurance Company, Ltd.

In local affairs Mr. Thompson has taken a great interest in the public library movement, having been a member of Dewsbury Public Library Committee since its foundation in 1890, and occupied the position of chairman for some years. His most interesting record, however, is in connection with technical education, he having been a member of the local committee for more than forty years, while at present he is chairman of the technical school, which is one of the most progressive and up-to-date schools in the kingdom, having an attendance of about 1,000 students. Mr. Thompson has also taken a great interest in Freemasonry, and is a Past P.G.O. of West Yorkshire.

We regret that the portrait of Mr. J. Davidson, Secretary of the Yorkshire Federation, has not reached us in time for publication in this number.

The Northern Counties Federation of Building Trade Employers.

The Northern Counties Federation of Building Trade Employers, which was founded in the year 1898, comprises the counties of Northumberland, Durham, Westmorland, and Cumberland, and the town of Middlesbrough. The associations governed by and affiliated to the Federation number eight, and (that of Middlesbrough excepted) these are outside the two counties of Northumberland and Durham. The membership, including individual members, is approximately five hundred. Within the Federation, for the maintenance of local working rules, etc., there are two district "associations of associations," viz., Tees-side Association, comprising the local associations of Middlesbrough, Stockton-on-Tees, and West Hartlepool, and the Tyne and Blyth District Federation, comprising the local associations of Newcastle-on-Tyne, North and South Shields, and Blyth.

Since the adoption of the scheme of conciliation boards for the building trade, those within the district have worked with satisfactory results.

The intertrading rule, with various modifications, has been adopted throughout the Federation, and has been the means of securing additional membership and strengthening the position of the associations.

The relations with the operatives have been undisturbed by strikes or lock-outs for some time, as the result of the operations of the conciliation boards, and of the absence of the aggressive tactics of the operatives so prevalent in the past when trade was brisk. The present depression has not been used by the employers to effect retaliation, as it has not been their policy to seek reductions in wages, but rather to secure more equitable and reasonable working rules, making for greater economy and freedom by avoiding waste and friction.

The work of organisation is proceeding, and there are hopes of securing the affiliation of the Darlington Master Builders' Association in the near future.

The funds are raised by annual subscription; the mode of fixing and raising the subscription being to ascertain each year the sum needed for the Federation, the Northern Centre, and the National Federation, and, on the basis of the previous year's wage-pay, to fix what rate per cent. of wages paid by the members will produce the sum required, and levy accordingly as the subscription for the year: the minimum subscription accepted from any member is one guinea.

During the year 1908, the following subjects have engaged the attention of the Federation: Conditions of contracting for public authorities; the adoption of the "Builders' Journal" as the official organ; collective bargaining for workmen's compensation insurance; furnishing evidence with respect to accidents in the building trades; the consideration of decision not to seek reduction in the wages of the operatives; the conduct of proceedings before the conciliation Boards; the question of fair terms for sub-contractors; and the adoption of the intertrading rule in the district.

It is now well recognised that the Federation is not a philanthropic institution, but underwrites many of the risks of contracting, in the sense that it protects contractors against the aggressive tactics of operatives, against unfair stipulations by building owners and architects, and against many other contingencies; so that the organisation has not only justified its existence, but has proved itself an absolute necessity to the trade.

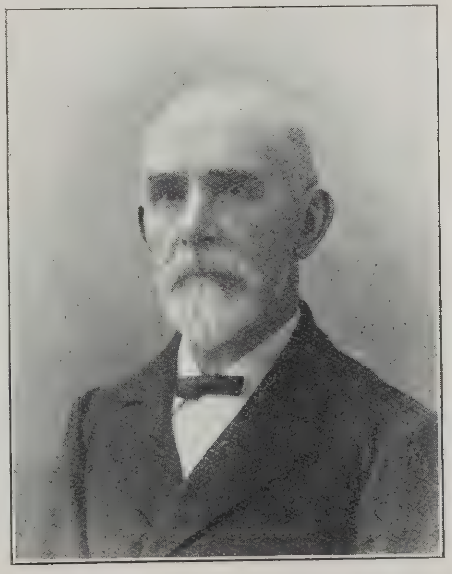


Photo: Thirlwell & Co.

Mr. JOHN DAVISON, President of the Northern Counties Federation and of the Stockton and District M.B.A.

Mr. John Davison, builder and contractor, of Stockton-on-Tees, began business forty-four years ago, and has executed several of the largest contracts in the town and district, including the post office, the Friends' Meeting House, the Y.M.C.A. building, Lightfoot Grove Chapel, Park Buildings, Middlesbrough County Court, Middlesbrough post office additions, a Baptist Chapel at West Hartlepool, Deanbank Chapel, Ferryhill; addition to Northallerton Tarpaulin Works, additions Stockton Higher Grade Schools, etc., etc. He was one of the builders present at a meeting, on April 30th, 1890, to commence an association. This association, which seems to have collapsed the same year, was resuscitated on May 4th, 1893, when Mr. Davison was chairman of the meeting. This association met with varying success up till October, 1896, when Mr. Davison undertook to act as hon. secretary, as well as holding the office of president. From that time the association steadily improved. Almost every builder in the district is now a member, and the association is financially prosperous. In February, 1897, the present secretary, Mr. W. C. Creasor, was appointed, and Mr. Davison was re-elected president, an office to which he has annually (despite his protests) been re-elected. Mr. Davison was also the first president (in 1897) of the Tees-side and District Association, which includes Stockton, Thornaby, Middlesbrough, Hartlepools. He took an active and prominent part in the formation of this Association, and also of the Northern Counties Federation, of which he is now president. Mr. Davison rarely misses a meeting, and his work has helped in no small degree to the successful organisation of this district.

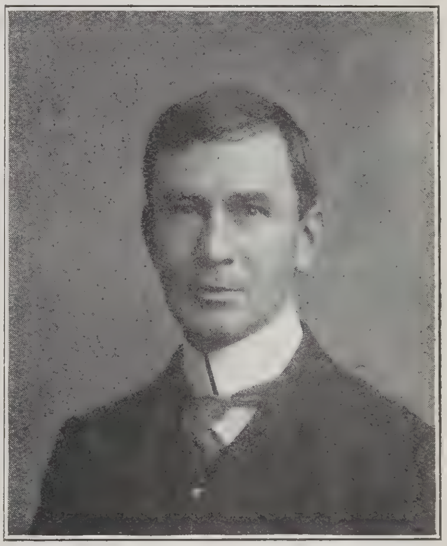

Photo: French

Mr. WILLIAM HENRY HOPE, Secretary of the Northern Counties Federation.

Mr. William Henry Hope is the son of a solicitor, and was born at Sunderland on July 9th, 1872. His education, commenced at the Sunderland High School, was completed at Durham University. He left Durham to take up an appointment in poor law service, in which he laid the foundation of his knowledge of poor law practice and procedure, in which he is a recognised expert. After serving articles in Sunderland and London, Mr. Hope was admitted a solicitor in 1897, and soon after starting practice was appointed secretary of the Sunderland Master Builders' Association, and by his tact and firmness and organising abilities so won the confidence of the trade that he was later appointed to a similar position successively by the Tyne and Blyth Federation of Building Trade Employers, and the Northern Counties Federation of Building Trade Employers, and he holds these three secretaryships at the present time. Mr. Hope, in addition to his building trade appointments, carries on with his partner Mr. Ritson an extensive general legal practice in Sunderland, is solicitor to the Sunderland Rural District Council, and still holds several appointments under the Poor Law administration. Mr. Hope's abilities have received recognition from his brother Poor Law officers, and he is at the present time president of the Northumberland and Durham Poor Law Officers' Association, and senior vice-president of the National Poor Law Officers' Association. Mr. Hope has been a member of the Sunderland Borough Council since 1903, when he was elected as representative for Central Ward, defeating his opponent, who stood as a Labour candidate, by a majority of nearly two to one. Upon coming up for re-election in 1906, Mr. Hope's return was unopposed. Mr. Hope is a prominent and enthusiastic Freemason, a Past Master of the Phœnix Lodge and the Thornhill Lodge, and has this year attained to provincial office in the craft.

TIMBERS OF COMMERCE: SOURCES OF SUPPLY.

Mr. H. J. Elwes, F.R.S., lecturing on "Timbers of Commerce: Their Present and Possible Future Supply," at the Carpenters' Hall, London Wall, E.C.. on March 18th, remarked that since 1900 he had been studying trees which may become the timber trees of Great Britain. Recalling a lecture which he gave at the Surveyors' Institution five years ago on timber trees that can be produced in Great Britain, but had been ignored, he remarked that it is useless to blind ourselves to the fact that we cannot compete, either in quality or in price, with some other countries in the economical production of timber. He was convinced that we can only compete with other countries in the economical production of a few hardwoods—oak, elm, ash, sycamore, and walnut. The afforestation of waste land, and the proper planting of trees thereon, can never be remunerative.

Briefly reviewing the principal sources of our timber supplies, he remarked that 90 per cent. of our timber comes from Northern Europe, Sweden, Finland, and Russia. Scotch pine and spruce cover millions of acres of land where agriculture is impossible. These forests will, he said, always be the future sources of our supplies. Larch comes in limited qauntities from the White Sea, but competition in this timber will never be so severe to the British landowner as that which involves pine and spruce. Taking the Mediterranean and the Black Sea, these, he said, are important as regards the production of oak. Known as "wainscot," oak has, on account of the various good qualities which it possesses, endeared itself to the architect and the joiner, and has consequently become dear. How long supplies will last it is difficult to say, but the French have bought large quantities, seeing the scarcity of oak in their own country.

The lecturer next referred to an oak, called brown oak, which has been ignored by our architects, but very much appreciated by the Americans, who consider it the best for decorative purposes. Manchuria and Korea have large forests, used by the Japanese. No people have more skill and taste in woodwork than the Japanese. They never use plaster, but substitute wood, which they never paint or varnish, depending for effect upon the grain. Dealing with Japanese timbers, he remarked that he did not think there were any conifers which will be used in England for fine work. Among the hard woods, of which there are many, there are none which have been brought into our markets in large quantities. The tropical forests of Southern Asia produce many timbers which will become very valuable, but we must never expect to get supplies of tropical hardwoods equal in size and quality.

Having briefly reviewed the possibilities of the supplies from Borneo, Sumatra, and the Andaman Islands, the lecturer proceeded to deal with the timbers of India, whose forests are better known than those of any other tropical country. She sends us, however, little but ebony, rosewood, and satinwood.

Then we come to North America, which next to Northern Europe, gives us the largest of our timber supplies. The forests, however, have been so recklessly exploited, and such large quantities have been destroyed by fire, that they are approaching exhaustion, and others are being used as substitutes. In spite of the opinion of many eminent writers, the lecturer remarked that he could not see any imminent danger of the supply failing. The two American pines that we know best are white pine and pitch pine. The former is so high in price that it is only used for first class work by cabinet-makers. Pitch pine, however, is used generally. There is no tree, the lecturer said, whose forests have been so depleted as those of pitch pine. As for American spruce, it covers enormous areas in Canada, and though the consumption has been enormous (it being the principal wood used for making paper), experts agree that owing to the rapid way in which it is reproduced, there is enough to last for ever. Of the American hardwoods, the chief are white oak and red oak, so much of which has been used lately that the supply will not last; and this should be one of the greatest inducements to English landowners not to sacrifice the valuable oak at the low prices at present obtaining. English oak is, and will remain, the best timber for certain uses.

After enumerating many other woods, he drew attention to the fact that English ash for oars is as good as, if not better, than any American ash, and as the American supply is likely to fail, the development of ash in England should be encouraged. Passing on to the Pacific Coast of North America, of which Oregon pine is the most important timber, he remarked that, although the quantity felled is enormous, and although large quantities are destroyed by fire, yet the reproduction is so rapid that, with good legislation, there will be a good supply for an indefinite period.

With regard to the West Indies and Central America, there is no information about mahogany to enable one to forecast the supply from these districts in the future, as this seems to depend largely on the cost of labour and transport. Greenheart, on account of its great strength, is one of the most valuable woods we have, and the supply seems to be getting exhausted in the accessible parts of British Guiana. The West Coast of Africa has been, in late years, the principal source of our mahogany supply, and to-day probably three-fourths or two-thirds of it comes from that quarter. Madagascar is full of woods of which we know almost nothing.

Then we come to Australia and New Zealand, and this is a subject which would require an evening to itself. Their timbers are very little known, and none of the Government publications give any idea of what the future supply is likely to be. Some interesting samples of the various woods alluded to in the course of the lecture were on view round the hall, and frequent reference was made to them by the lecturer during his discourse. The chair was taken by Sir Hugh Beevor, Bart., M.D., etc.

Coming Events.

Wednesday, April 7.

NORTHERN POLYTECHNIC ARCHITECTURAL AND BUILDING STUDENTS' ASSOCIATION.—Lecture on "The Hennebique System of Reinforced Concrete," 8 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION (117, George Street).—Associates' Business Meeting, 8 p.m.

INSTITUTION OF CIVIL ENGINEERS (Great George Street, Westminster).—Students' Visit to the Chingford Reservoir Works of the Metropolitan Water Board.

Thursday, April 8.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS (University, Western Bank).—Annual Meeting.

PAINT AND VARNISH SOCIETY (St. Bride's Institute, E.C.).—Mr. W. G. Aston on "Lakes," 8 p.m.

Saturday, April 10.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

Enquiry forms have been issued to the associations through the various Federations requesting information as to current rates of wages and hours of labour, for publication shortly in the form of a comparative statement.

The Sweated Industries Bill at present before the House of Commons has been considered, and objections have been formulated and conveyed to Members of Parliament likely to render assistance in opposing the objectionable features.

It was reported last month that communications had been addressed to the War Office and Post Office *re* their asking for tenders without quantities. A reply has been received from the former to the effect that, as far as practicable, in future quantities will be supplied for works of over £500 in value.

A dispute with plasterers occurred at Swansea owing to a sub-contractor employed by one of the Swansea members employing labourers to do plasterers' work. The matter has now been satisfactorily adjusted.

The secretary attended a conference of the secretaries of the Midland Centre at Birmingham on March 25th, and contributed a paper. The meeting was well attended, and a good and useful discussion took place.

On the following day he attended a meeting of the Nottingham Association, and contributed a paper on the intertrading rule. After an interesting discussion, it was decided that it was advisable to adopt the rule in Nottingham, and the further steps to be taken were referred to the executive committee.

The secretary also attended the annual dinner of Cambridge Association.

The president (Mr. E. J. Brown) attended the annual dinner of the Bristol Association on March 30th.

The Trade Disputes Bill, which seeks to make arbitration compulsory in trade disputes on the application of either party, has been considered, as the Bill in its present form would, if it became law, be likely to interfere injuriously with all existing voluntary schemes of conciliation. This objection has been laid before the Employers' Parliamentary Council, with a request that an amendment should be sought providing that such legislation should only become operative after existing voluntary conciliation boards have failed to settle the dispute.

Members are again reminded that arrangements have been made for a party of our members to visit the International Building Trades Exhibition on the evening of April 20th, at 5.30 p.m., on the invitation of Mr. H. Greville Montgomery, M.P., one of the directors. Although it is desired as far as practicable to arrange the visit as above, the tickets are really available any time, and those who find the evening time inconvenient can suit their own convenience. Tickets on application to the secretary.—A. G. White, secretary.

THE NORTHERN CENTRE OF THE NATIONAL FEDERATION

COMPOSED OF

The Lancashire, Cheshire and North Wales Federation, The Yorkshire Federation and The Northern Counties Federation.

Secretary: JAMES DENVER, Cromwell Buildings, Blackfriars Street, Manchester.

Northern Centre Board of Conciliation the Building Trades.

The Court of Arbitrators appointed by this Board to investigate into the case reported in the issue of this Journal for March 24th last, in which the Liverpool Stonemasons' Society claim a firm, members of the St. Helens Association, to be Liverpool employers, have now given their decision, and find the said firm to be Liverpool employers as claimed.—JAMES DENVER, Employers' Secretary.

THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION

Secretary: JOHN TOMLISON, Cromwell Buildings, Blackfriars Street, Manchester.

The monthly meeting of the Administrative Committee of this Federation was held at the Board-room, Blackfriars Street, Manchester, on Friday afternoon, March 12th, when the president (Mr. William Bullen) presided over an attendance of eleven representatives.

Matters arising out of the publication of the half-yearly reports were discussed, and resolutions passed thereon.

The accounts for the quarter presented by the secretary were recommended to the Executive Board for payment.

The April monthly meeting was postponed until the 16th, owing to the usual date falling on Good Friday.

Some discussion took place on the position of ex-presidents on the Administrative Committee, and it was agreed to place the matter on the agenda for the quarterly meeting of the Executive to be held on March 29th at Blackburn.

A deputation attended from the Bolton Association with reference to a case of one of their members who had signed a contract appointing the architect as the sole arbitrator, and he had refused to allow for extras for a very considerable sum. After hearing the deputation, it was agreed to have the opinion of a solicitor and counsel on the case if necessary.

Circular letters were read from the National Federation with reference to the International Building Trades Exhibition and the official journal.

The proposed new rules of the Accrington Association, and the revised rules of the Radcliffe Association, were before the committee for approval, and after some discussion, it was left to the secretary to write to the respective societies pointing out several matters for their reconsideration.

The quarterly meeting of the Executive Board of this Federation was held at the Old Bull Hotel, Blackburn, on Monday, March 29th, when the president (Mr. William Bullen) presided over a fair attendance of members.

The secretary reported that he had received several suggestions from local associations for amending the National contract form, and it was agreed to forward the same to the Administrative Committee with a recommendation that they be laid before the National Federation for their consideration.

The Administrative Committee were instructed to redraft Rule 9, and to give formal notice for amending it with regard to the formation of that committee.

The revised rules of the Lancaster, Radcliffe, and Accrington Association were approved and adopted.

The secretary reported that he had received notice from the Federated Employers' Insurance Association, Limited, for amending the Federation Agreement and rates, and he was authorised to call a meeting of the Insurance Comittee at an early date to give the same consideration.

The Blackburn employers were invited to meet the committee to discuss trade matters and the desirability of again becoming affiliated to the Federation, but there was only a small response, and nothing formal was done in this direction.—JOHN TOMLISON, Secretary.

THE YORKSHIRE FEDERATION.

Secretary: J. DAVIDSON, 14, Park Road, Leeds.

The monthly meeting of the Executive Council was held at the Builders' Exchange, Northumberland Street, Huddersfield, on Thursday, March 18th. Mr. W. R. Thompson, president, occupied the chair, and thirty-nine delegates from affiliated associations were present.

The president referred to the loss which the Federation and the Hull Association had sustained by the death of Mr. Goates, of Hull. He moved that an expression of the deep sympathy and condolence of the Federation be tendered to the relatives and the Hull Association. The resolution was seconded by Mr. Biggin and passed in silence.

The treasurer reported receipt of £8 10s. on reserve fund account, and £123 12s. on account of subscriptions. He tendered his sincere thanks to the local associations who had so generously responded to his appeal for an early remittance on account of subscription for the current year.

Correspondence from the Hull Association was read containing suggestions for amendment of the National form of contract. Messrs. E. Quibell and J. T. Levitt referred to the same, and emphasised the importance of obtaining their incorporation if at all possible. On the motion of Mr. A. W. Sinclair, seconded by Mr. E. Quibell, it was resolved to request the other local associations to forward their suggestions for amendment, alterations, and additions to the Federation secretary at the earliest possible date, and that these be considered by the Emergency Committee with a view to a report being presented to the Federation.

The written observations of the Barnsley and Wakefield Associations on the expediency of obtaining a declaration from workmen on entering employment were read. A discussion ensued, and it was ultimately resolved, on the motion of Councillor W. G. England, J.P., seconded by Mr. J. Biggin, to defer the consideration of the question until the replies of the local associations are received.

A draft sub-contract form had been prepared, and a copy forwarded to each representative and secretary of local associations. One or two suggestions for amendment were

ROBERT HALL,
Building Surveyor,
52, Frederick Street, BURY.

made, and it was resolved, on the motion Mr. J. T. Levitt, seconded by Councillor W. G. England, J.P., to refer the matter to the Emergency Committee for further consideration and report.

A letter from Mr. A. G. White, the National secretary, was read, as to reference being made on the official stationery of the various Federations and local associations as to "The Builders' Journal" being the official organ. It was resolved, on the motion of Mr. J. S. Myers, seconded by Mr. C. Bent, that when further supplies of stationery are being ordered for the Federation, the following words be printed: "'The Builders' Journal' is the official organ of this Federation.'"

It was reported that the income from advertisements would probably defray the cost of the printing of the new issue of the Federation Directory. On the motion of Councillor W. G. England, J.P., seconded by Mr. J. T. Levitt, it was resolved to request the affiliated local associations to take a copy for each member on preferential terms of 2d. each, exclusive of carriage; and that single copies be supplied at 6d. each. It was further resolved, on the motion of Mr. A. J. Forsdike, seconded by Mr. S. Coop, to draw attention in the directory to "The Builders' Journal," and invite members to become subscribers in order that the National Federation may derive the fullest advantage from the arrangement with the proprietors of the journal.

A letter on the Housing, Town Planning, etc., Bill, which had been addressed, on behalf of the Federation, to the President of the Local Government Board, and handed to Mr. Burns personally by the secretary of the Employers' Parliamentary Council, was read. Reference was made to the strong opposition from many sources which was being made to the clause providing for a quinquennial survey, which, although included in the Government Bill in fulfilment of a promise, it was understood met with the opposition of the Local Government Board.

A letter from the National secretary, containing particulars of the action taken by the National Federation and the Employers' Parliamentary Council arising out of a motion by a Labour member asking the House to practically base the fair wages clause on trade union conditions and wages was read. Owing to the opposition of the Government, the motion was subsequently withdrawn, and one submitted by the Government was unanimously approved.

It was reported that the Observations of the Employers' Parliamentary Council on Bills in Parliament had been supplied to each local association and representative, which Observations included the following among other Bills: (a) Sweated Industries, (b) Trade Disputes.

A letter was read from the secretary of the Sheffield Association, enclosing a communication which had been received by him from one of their associate members, drawing attention to the action of the Bridlington Association. It was stated that two of their customers in Bridlington had been officially requested by the secretary of the Bridlington Association to attend a meeting, and show cause why they had accepted a tender from a firm who were not members of the local association, or had a local establishment. Mr. Robinson, of Bridlington, stated that their members did not object to fair and open competition of bona-fide building trade employers, who were members of local associations affiliated with the Yorkshire Federation. In the case in point, however, the firm who had made the complaint were timber importers and slate merchants, and the members of the Bridlington Association considered it a most objectionable practice that merchants who supplied building trade employers with materials should also enter into direct competition with them to secure work on which their livelihood absolutely depended. They had referred to the last issue of the Yorkshire Directory, and could not find that the firm in question was included among the members of the Sheffield Association.

Mr. Forsdike, on behalf of the Sheffield Association, pointed out that the firm in question had joined the Sheffield Association when they commenced business. They had appealed to the association for their support, and the cause of the objection of the Bridlington Association had not been previously explained. They were originally under the impression that the objection was based solely on the fact that the firm in question were not members of the Bridlington Association. Seeing that the ground of objection was the direct trade competition of builders' merchants with building trade employers, he would withdraw the particular case at present, in order that it might receive further consideration by the Sheffield Association. At the same time his association desired a clear and definite statement of the benefits and recognition which the associate members of a local association were entitled to receive from the federated associations. They therefore asked for expressions of opinion, or an officially authorised statement, as to the reciprocal relations under the inter-trading rule between associate members of local associations affiliated with the Federation. In order that the inter-trading rule might be discussed in all its bearings, it was resolved, on the motion of Councillor J. Dawson, seconded by Mr. P. Rhodes, to request the local associations to give the rule and its scope most earnest consideration, and favour the Federation with their observations and recommendations as early as possible.

A letter was read from the Sheffield Association with respect to the arrangements which had been made between the Sheffield Corporation and the association with respect to the erection of hoardings.

The president reported that the Emergency Committee had considered the documents in the York case, and that a draft statement for submission to counsel had been prepared and was receiving careful attention. Mr. Coop, president of Dewsbury Association, invited the Federation to hold the next meeting in that town; and on the motion of Councillor J. Dawson, seconded by Mr. J. Biggin, the invitation was cordially accepted, and the meeting fixed for Thursday, April 15th.

The representatives were entertained to tea by the president and members of the Huddersfield Association, to whom a hearty vote of thanks was accorded for their generous hospitality.—J. DAVIDSON, secretary.

LOCAL ASSOCIATIONS AFFILIATED TO THE YORKSHIRE FEDERATION.

LEEDS ASSOCIATION.

Secretary: J. Davidson.

The monthly meeting of the Leeds Association was held on March 9th. The president (Mr. W. Irwin) was well supported by members.

It was decided to make representations to a member who was not giving reasonable preference to members of sub-trades who were members of the association.

Mr. J. Pickard and other members reported the proceedings of a conference with the Leeds and Yorkshire Architectural Society on the preparation of plans by builders. The architects pointed out that this was a growing practice, and one which might easily involve builders in very unpleasant and costly consequences. It was contended that several distinct advantages accrued to builders by the fact of having an architect to appeal to in the event of unreasonable requests of clients. The matter received the careful consideration of the association, and a resolution was ultimately passed expressing the opinion that the practice of builders drawing plans should not be extended or encouraged, and members were requested to give the same their earnest attention.

A committee was appointed to consider a suitable place for the meetings of the association in view of the termination of the lease of the Builders' Exchange on March 31st. A resolution was passed to pay a sum to the Yorkshire Federation on account of subscription for the current year.

The members considered the National contract form, and their representatives were desired to obtain further information on the amendments suggested.

The members also felt that it was highly desirable that some certificate should be signed by an employee when commencing service, in order to ensure that only those were engaged who were physically fit and constitutionally sound.

SHEFFIELD ASSOCIATION.

Secretary, T. Smith.

The annual dinner of the Sheffield Master Builders' Association was held at the Building Trades Exchange in Cross Burgess Street on March 17th. About 110 were present. The president, Mr. W. W. Mears, was in the chair and amongst those present were Sir John Bingham, Bart., Alderman Nixon, Councillor Cattell (chairman of the Health Committee), Councillor Fenton, Mr. F. E. P. Edwards (city architect), Mr. A. Sinclair (Scarborough), Councillor England (Barnsley), Mr. W. R. Thompson (Dewsbury, president of the Yorkshire Federation of Building Trades Employers), Mr. W. Longden, and Mr. Thomas Smith (secretary).

After the usual loyal toast, Mr. A. W Sinclair proposed "The National and Yorkshire Federations of Building Trades Employers." He rejoiced that they were now able in almost every case to settle disputes without strikes and ill-will, and the consequent heavy financial loss. They could not have had the Conciliation Board which dealt with these matters had it not been for the Federation.

Mr. W. R. THOMPSON, in response, said he looked upon the Sheffield Association as one of the premier associations in the country. They had always held a powerful influence in the deliberations of the Yorkshire Federation. If the motion, proposed by Mr. John Hodge in the House of Commons on the preceding Wednesday, had been carried, they would have been under the heel of trade unionism very much more than ever they had been in the past, because in all Government contracts they would have had to adopt trade union rates of wages and trade union rules. Referring to Mr. Herbert Gladstone's proposal to invest the Home Secretary with power to make certain rules and regulations applicable to the engineering and building trades, he said that some of the propositions were very unnecessary and very onerous. One useless rule was that all chains used in hoisting should be tested and annealed every year, and also examined by a competent person every three months, and a register kept for the inspector's examination. It did not say anything about wire ropes, so probably it was one of those proverbial rules they could drive a coach and six through. It was proposed also that painters and plumbers should be provided with water, soap, brushes, and towels.

Sir JOHN BINGHAM, replying to the toast of the "City and Trade of Sheffield," proposed by Councillor England, expressed his opinion that contract work was far and away better, and more to the interest of the working men, than municipal labour. They would know, then, what they had to get, and it was the fault of the authorities if they did not get it.

Councillor CATTELL, who also responded, considered it one of the greatest crimes a Corporation could commit to use the ratepayers' money in competition against the ratepayers themselves. He confessed with shame, he said, that the two building estates the Corporation had in their possession were losing piles of money every day, and, notwithstanding that, the housing of the working classes to-day, taken as a whole in the city, was in no better condition than it was five years ago. Whilst they had cleared out slums in the Crofts area, there were many living in parts of Sheffield to-day under conditions which were no credit to the city. If they had only learned the lesson from the Wincobank cottage exhibition that they ought to have done, they would have been in a very much better position. But, unfortunately, a few faddists on the Council would have their own way, and one of the most foolish acts the Corporation ever committed was in purchasing the houses. What was the good of purchasing them? The houses were there, the conditions were there, and the working classes were housed. He asked for the co-operation of builders in the great work of housing the working classes in a proper manner. The outskirts of Sheffield should be dealt with as a whole, and the co-operation of neighbouring local authorities should be secured. He believed that Mr. John Burns's Bill would assist them in the work.

Mr. A. J. FORSDIKE, in proposing "The Architects and Surveyors," said that it was most desirable that architects should have a practical as well as theoretical training. Only a practical training could fit an architect to undertake with confidence the very serious responsibility which now attached to his profession. He strongly deprecated the ordering of materials by architects, and in specifying the material of any particular maker, he thought that specification should read, "or other of equal value." P.c. sums were an ever-present bone of contention between them, and builders regarded this as an unfair method of giving out work. He thought they should be put into quantity form wherever possible. He was also strongly in favour of greater uniformity in making out quantities. As builders, they would like quantity surveyors pure and simple, apart from architects altogether. With regard to "squaring-up," he also thought they were entitled to have something to say. The contract contained a clause as to when the work should be completed, and it was only fair that there should also be a stipulation as to when the contractor might rely on getting paid up. Profits were exceedingly small, and it was most unfair that a contractor should be kept waiting until it was convenient for the architect to measure up a job. The ruinous prices which obtained were perhaps to some extent their own fault, as at such times employers were anxious to keep their men together. In conclusion, he wished to offer an explicit assurance that the Masters Builders' Association did not constitute a ring for raising prices, and competition between the members was on perfectly legitimate lines. They had latterly had the question of walking time much to the front, and in seeking to abolish it they were making an endeavour to cheapen building operations without in any way interfering with the wages of the men.

Councillor FENTON, in reply, referred at the outset to the question of quantities, and said that the suggestion that they should have a model set would be difficult to put into practice; but a model form of specification would, he thought, be an advantage to all concerned. With respect to the settlement of contracts, he sympathised much with builders who had difficulties of that kind. He was quite agreed that architects should not order materials, though an exception might be made in certain patented articles. With respect to the remark of one of the speakers, who cited an instance where 75 per cent. of the contract consisted of p.c. sums, and the contractor was held responsible for defects in the whole, he thought it was a case in which the 25 per cent. should be quite a separate item for which the contractor should take no responsibility in any shape or form. There were one or two matters still in negotiation between the architects and surveyors and the contractors, but he was happy to say that the relations between the two societies were never better. The Architects' Society had taken counsel's opinion, which confirmed their own impression, that workmen's insurance was a matter solely for the contractor, and could not legitimately form an item in the quantities. In p.c. sums there was a resolution of the Architects' Society, that an item should be inserted for profit and fixing; and if this was done, there was not very much to grumble about. The question of the approval of the contract agreement form was still before the R.I.B.A., who pointed out that it made no provision for the bankruptcy of the contractor, and as soon as a reply was received, it should be communicated to the Master Builders' Association. In conclusion, he pleaded for more attractive buildings, and mentioned that in his recent visit to Vienna and Buda-Pesth, he had been much struck by the extraordinary amount of money spent in beautifying their buildings, as compared with Brussels, Paris, or London.

The PRESIDENT, replying to the toast of his health, proposed by Councillor J. Dawson, remarked that forty-seven new members had been admitted during the year, and the organisation and finances had been put on a satisfactory basis.

At the annual meeting of the Sheffield Master Builders' Association, the President (Mr. T. Eshelby) presiding over a large attendance of members.

The audited balance sheet was presented by the Treasurer, and showed the finances of the Association to be in a most satisfactory position, there being a substantial addition to the capital accounts as a result of the year's working.

Mr. W. W. Mears was unanimously elected as President for the ensuing year, and in investing him with the chain and insigna of office, the retiring President reminded him that he had now attained to the highest position and the highest honour which the Association were able to confer upon him, and he wished him health and prosperity in carrying out his onerous duties. Mr. Mears then took the chair, and thanked the members warmly for the position in which they had placed him, a position which conferred obligations which it would be his constant endeavour to discharge in a manner worthy of the best traditions of the Association.

The retiring president (Mr. Eshelby) was accorded a most hearty vote of thanks for the manner in which he had presided over the deliberations of the Association during the past year, and was unanimously elected an honorary vice-president of the Association.

Mr. Wm. Longden (Messrs. Geo. Longden and Son, Ltd.) was unanimously elected vice-president for the ensuing year. For the twelve places on the committee there were fifteen nominations, and a vote by ballot resulted in the election of the following gentlemen:—Messrs. H. H. Hodkin, W. May, F. Turner, G. C. Alflat, F. Fidler, J. C. Warring, G. Roberts, J. S. Teanby, W. Lockwood, W. R. Union, J. Dawson, and G. H. Brown. The members of the Conciliation Board elected were:—Messrs. W. Longden, J. Biggin, A. J. Forsdike, J. D. Cook, A. Mastin, T. Roper, G. E. Powell, W. W. Mears, T. Eshelby, and F. Fidler. Mr. J. J. Parker, C.A., was re-elected as auditor for the ensuing year.

At the close of the annual meeting, the monthly meeting of the Association was held and presided over by Mr. W. W. Mears. The business was more or less of a routine character, and with the exception of the question of walking time raised by the operatives in relation to a job on which a member of the Association was engaged, no discussion of general interest took place.

The annual report read at the annual meeting showed a very flourishing state of affairs, and the progress was stated to be all the more noteworthy in view of the fact that in every respect the Association had achieved its record progress at a time of unprecedented depression in the building trade. The organisation of the Association had been much improved, and was now considered to be equal to that of any association in the country. During the year several contentious matters had arisen between the Association and the City Council, and on one occasion the Association had considered it necessary to protest to the President of the Local Government Board against aspersions cast on their business at a Local Government enquiry. The Corporation's housing schemes had claimed the attention of the Association, who had protested strongly against the policy of the City Council in developing building estates, at a cost which compared most unfavourably with the cost of the same work done by private contractors. At the same time, the Association pointed out that in developing their estates, the Corporation adopted methods of cheapening in regard to roads, which would amount to £20 per house, and which methods, though perfectly satisfactory, and, in fact, preferable in suburban roads, were not permitted to the private contractors. In connection with retention money on contracts, the Association had obtained, as a result of their representations, a substantial concession, and the City Council now agreed to retain only 5 per cent. on a contract for six months after completion, instead of 10 per cent. for twelve months. The City Council's new by-laws were still *sub judice*, and a deputation from the Association to discuss the objections which the Association had raised, would meet a committee of the City Council in due course.

The question of day-work prices had been discussed on several occasions, and was still being considered.

The Conciliation Board had met several times, and had satisfactorily disposed of matters brought before it. The main questions had reference to walking time, and in view of the trouble and anomaly which walking time entailed, it had been decided to abolish it.

With the Architects' Society the relations of the Association were satisfactory, but there still remained questions unsettled. The Architects' Society could not see their way to adopted the National form of contract, which they complained did not provide for the bankruptcy of the contractor, while it made provision for a like contingency on the part of the proprietor.

Socially, the Association had had a busy year, and only an improvement in trade was necessary to still consolidate further its position and usefulness.

YORK ASSOCIATION.

Secretary: J. Hague, Solicitor.

The York Conciliation Board met on Wednesday, March 24th, to try an appeal by the Operative Society of Carpenters and Joiners against a notice for alteration and addition to working rules given by the masters. Mr. Councillor Geo. Sharp (president of the Board) was in the chair, and was supported by Messrs. T. W. Magson (vice-chairman), C. Spence, R. Porteus, G. Crewcaft, Coulson, and F. W. Nicholson, representing the operatives, and by Messrs. W. E. Biscomb, W. Bellerby, C. Dent, H. Colman, and L. Wray, representing the masters.

The notice against which the appeal was made was:—To delete the words "radius ten miles," from the title page, and also from the printed heading above the numbered rules; to limit the payment of lodging and railway fares to workmen sent out from York to work outside the radius; and to fix the area in which working rules applied, at four miles from the head post office at York.

The case for the appellants was opened by the secretary to the Operatives' Society, and the case for the masters was then given.

The Board considered the case on the facts which had been placed before them, and, on a vote being taken, it was carried unanimously that the notice given by the masters for alterations and additions be upheld, and the decision of the Board was announced by the chairman.

At the conclusion of the hearing, a vote of thanks was accorded to the Lord Mayor for kindly allowing the use of the Old Council Chamber at the Guildhall.

THE NORTHERN COUNTIES FEDERATION.

Secretary: W. H. HOPE, Solicitor, Post Office Chambers, 14, Norfolk Street, Sunderland.

Minutes of a meeting of the Executive Council held in the Board Room, 14, Norfolk Street, Sunderland, on Thursday, March 4th, at 4 o'clock in the afternoon, Mr. J. Davidson (Stockton), in the chair, when fifteen representatives were present.

The minutes of the executive council meeting held at Sunderland on November 24th, 1908, were read, and the members agreeing were signed by the president as correct.

The question as to whether the National form of contract had worked satisfactorily or otherwise in the Federation's area, and whether any amendments appear to be necessary, was discussed. The secretary reported that all the local associations had been written to, asking for their observations, and read the suggested amendments received from the local associations, which were further commented upon by the representatives of the different associations. It was thought generally that contractors should not be held liable for material which was specified by the architect, as they had no voice whatever in its selection, and might have protested in voice against its use; that there should be some time fixed when the building owner should be held to have accepted delivery of the work so as to put an end to the contractor's general liability, and that provision should be made for more than a cash discount in reference to P.C. sums. Several instances were given where the architect had taken tenders for different work and material and included the price in the bill of quantities as P.C. sums, when, unless the builder himself added a sum for profit, there was neither profit nor discount for him. The opinion was that this Federation should take a strong stand and insist upon the principle of a trade discount. After considerable discussion on the question, it was resolved, on the proposition of Mr. W. J. Robertson, seconded by Mr. R. Heslop: "That a small committee be appointed, consisting of the president, Mr. J. W. White, Mr. W. T. Weir, and the secretary, to go fully into the question and decide if any amendments were necessary, and if so what, and report to the quarterly meeting of the Board of Representatives." Mr. W. T. Weir asked that Mr. S. Easten's name be substituted for his, and this request was agreed to.

The secretary reported that a small subcommittee of Durham County Council had been appointed by the Buildings Committee to consider the grievances of the Federation. At the last meeting of the Buildings Committee this report was not received, owing to pressure of the ordinary business. It was resolved: "That members tendering should stipulate that the contract would be subject to any recommendations that might be ultimately adopted by the Buildings Committee."

Bishop Auckland Union invited tenders for workhouse buildings on the basis of quantities supplied, and stipulated that contractors were to enter into an agreement to forfeit £200 in the event of their withdrawing their tender. A circular was drawn up and forwarded to every member within the Federation, drawing attention to this, and advising them to stipulate in their tenders for the embodiment of the usual terms of agreement in a proper form of contract. It is understood that the work has been withdrawn for the present.

The Federation had printed and circulated a copy of the report of the bankruptcy proceedings of a contractor in Northumberland, who attributed his bankruptcy to a form of contract he had entered into with a district council, which form the official receiver severely criticised, describing it as "confiscatory," and observing that in the case of small contractors it must, if enforced, end in the bankruptcy court. Leaders upon the case appeared in "Builders' Journal" of January 20th, under the heading of "Scandalous Contract Forms," and in the issue of February 10th under the heading of "Unfair Contracts."

A member of the Newcastle Association has been asked to sign the Hexham R.D.C. form of contract for work to be done, which contained clauses that the council's engineer should be sole arbitrator, and the bills of quantities were not guaranteed. Correspondence had passed between the R.D.C. and the Newcastle Association, and the former replied that they were not prepared to alter their form, as the time in which the work had to be carried out is limited, but that they were quite prepared to consider any suggestion made in writing as to the form to be adopted in future cases. On the proposition of Mr. J. W. White, seconded by Mr. W. Foster, it was resolved: "That this Federation draw the attention of the Hexham R.D.C. to the unfair form of contract used by them, and forward them a copy of the National form of contract and ask them to adopt it in future cases."

The question has been raised upon what basis local associations elect their representatives upon the Board of Representatives, (1) whether their return included both ordinary and honorary members, and, if so, what payment was made to the Federation in respect of honorary members. Replies showed that five associations claimed representation on both ordinary and honorary members, but made no payment for honorary members. Three associations appointed representatives upon the number of ordinary members only, and made no payment for honorary members. The rule upon representation was read, that each branch association shall be entitled to elect one representative upon the Board for every 10 members or proportion of 10 over five. Nothing is said as to the classification of honorary members. On the proposition of Mr. J. W White, seconded by Mr. W. J. Robertson it was recommended to the next quarterly meeting of the Board: "That the same proportion of local subscription received from honorary members by the local associations be paid to this Federation in respect of honorary members, as in respect of ordinary members."

To illustrate this: if the subscription is, say, 3s. 9d. per £100 of wage for ordinary members, and 21s. for honorary, then when sending 1s. 3d. per £100 to the Federation for ordinary members, one-third of the guinea for honorary members is to be forwarded.

The secretary reported that the Darlington Association had written asking for particulars as to the cost per member for that association to become affiliated with this Federation, and that the matter would be considered by that association in March. This information has been given.

The South Shields Association raised the question as to whether one subscription paid to a local association within the Federation by a member gave him the benefits of membership over the Federation's area. It was decided: "That a member shall be considered a member within the district where he pays his subcription, and be upon the telephone card belonging to the association to which he pays his subscription."

The secretary reported informally upon the form of sub-contract agreement which he had drawn up upon the instructions of the Federation for the Teesside Association, which had been approved by counsel, and was under the consideration of the Teesside Association.

The question of a model apprenticeship indenture for the whole of the Federation was discussed, but as the conditions affecting each association were different, the preparation of a common form was not approved.

On the proposition of Mr. J. W. White, seconded by Mr. W. J. Robertson, Mr. Robert Wilson, of Barnard Castle, was elected a member of the Federation.

On the proposition of the president, seconded by Mr. R. Heslop, accounts amounting to £30 2s. 6d. were passed for payment.

LOCAL ASSOCIATIONS AFFILIATED TO THE NORTHERN COUNTIES FEDERATION.

SUNDERLAND AND DISTRICT ASSOCIATION.

Secretary: W. H. Hope, Solicitor.

A meeting of the Bricklayers' Trade Committee of the Sunderland and District Association was held at 14, Norfolk Street, Sunderland, on Tuesday, February 2nd, 1909, at 8 o'clock in the evening, when representatives of the employers and operatives were present. On the proposition of Mr W. Branton, seconded by Mr. G. W. Urwin, Mr. R. J. Huntley was unanimously elected chairman. The secretary read the proposed notice of alteration to the working rules and the correspondence thereon that had passed between the association and the society, and explained that this meeting had been called, at the request of the operatives, to consider informally the proposed alterations. The chairman then gave the reasons why the association sought to have the proposed alterations. Mr. Branton said that the proposed alterations had received the careful consideration of the members of the society, and they were not prepared to accept the alterations to Clause B as suggested by the employers, but proposed that the rule should be altered to:—"From the 8th November until the 20th November (both inclusive) all men shall commence work at 7.30 and cease at 4.30 (instead of 5 p.m.), with 20 minutes for breakfast and 40 minutes for dinner, except on Saturdays, when work shall cease at 12 noon, with 20 minutes for breakfast." As to Clause C, they rejected that altogether; and with respect to Clause D they proposed that work should commence at 7 o'clock, with full meal hours. After considerable discussion upon the matter, the chairman proposed, with respect to Clause C: "That work should commence at 8 o'clock, with 20 minutes for breakfast and 30 minutes for dinner, and finish at 4.30; commence on Saturdays at 8, and finish at 12, with 20 minutes for breakfast; making a total of 42½ hours per week." The operatives agreed to place this before their society for consideration. It was proposed that in Clause B the time should read: "From November 8th until November 27th work shall commence," etc.; and in Clause C: "From November 28th until January 24th, work shall commence," etc.; and in Clause D: "From January 25th until February 20th work shall commence," etc. It was agreed that both sides consider this proposal. The proposal put forward by the employers to the Bricklayers' Society for the adoption of a new working rule dealing with the notice of alteration to the working rules was considered along with the proposal of the operatives, that instead of 14 days being added to the present time for giving notice, "That a notice shall not be given in by either side later than 14 days previous to the expiration of the time for giving such notice, unless it be a counter-notice." It was decided that this proposal be forwarded in writing to the employers. The operatives submitted a proposed alteration to working rule (5), which reads: "A lock-up shed shall be provided for the accommodation of the workmen's tools, and in which they can have their meals," and that it should be altered to read as follows:—"A lock-up shed shall be provided for the sole use of the workmen, where they can keep their tools, and in which they can have their meals." This proposal is in view of the fact that some of the sheds were used as stores for cement, etc. It was agreed that this should be placed before the employers in writing. It was mentioned by the operatives that there was a proposal on foot for an eight hours' day during the summer period. It was agreed that this should also be placed before the employers in writing.

TYNE AND BLYTH FEDERATION.
Secretary: W. H. Hope.

At a meeting of the Executive Council of the Tyne and Blyth District Building Trades Federation, held at the Hotel Metropole, Newcastle-on-Tyne, on Thursday, March 18th, Councillor S. Easten in the chair, representatives were present from Newcastle-on-Tyne, South Shields, and Blyth, North Shields being unrepresented. A letter received from the National Federation asking whether any amendment to the National form of contract was desired, along with the replies received from the local associations, was discussed, and on the proposition of Mr. W. T. Weir, seconded by the chairman, it was resolved unanimously: "That this Council is of opinion that in any consideration of the National form of contract the question of prime cost sums be thoroughly gone into."

A complaint of violation of working rule had been received from the South Shields plasterers against a South Shields member. The facts were as follows:—A plasterer was unable to finish a small job on the Saturday morning, and had to turn up first thing on Monday morning to finish it. This he failed to do, and his employer waited until after dinner-time, when, as the job would have been spoiled had it waited any longer, he put a bricklayer on to finish it. A large amount of correspondence upon the question had passed between the Federation and the society before the latter wished to have a trade committee called, but this Federation saw no sufficient reason for doing it.

A complaint of violation of the working rules against members of the Newcastle Association who are carrying out work at South Shields had been received. The operatives had not replied to the employers' letter asking for the facts of the complaint.

The organisation secretary's report was read, and, on the proposition of the chairman, seconded by Mr. W. T. Weir, it was resolved:—"That it is desirable that Mr. W. C. Creasor attend the meetings of the local associations, and get into touch with their work, and that in future all notices calling their meetings be forwarded to him, and also to the Federation secretary."

The secretary reported upon the annual dinner, which was held at Newcastle-on-Tyne on December 17th last, when 136 were present. The dinner was considered one of the most successful that have been held under the auspices of the Federation. A deficiency amounting to £13 17s. was paid out of the funds.

A communication from the South Shields Association with respect to proposed new by-laws of the Sunderland and South Shields Water Company was read; but as no action can be taken at present, it was deferred until the issue of the by-laws by the water company.

On the proposition of the chairman, seconded by Mr. Ferguson, it was resolved: "That the train fares of the employers' representatives attending the Conciliation Board meetings be paid out of the funds of the Federation."

It was resolved to hold the annual general meeting at Newcastle-on-Tyne, on Tuesday, March 30th.

Accounts amounting to £41 16s. 4d. were passed for payment.

THE MIDLAND CENTRE OF THE NATIONAL FEDERATION.

Secretary: F. W. Amphlet, 58, New Street, Birmingham.

The usual quarterly meeting of the Executive Council of the Midland Centre was held at the Imperial Hotel, Birmingham, on Thursday, April 1st. The president (Councillor H. Smith) took the chair, and representatives were present from Birmingham, Walsall, Derby, Redditch, Nottingham, Northampton, West Bromwich, Leicester, and Worcester. The president and secretary were requested to see the secretary of the North Staffordshire Master Builders' Association, with a view to reorganising that Association.

The secretary was instructed to ascertain from the local associations how far the practice of architects and others in requiring priced quantities to be supplied with tenders obtains in the Midland Centre area.

In his quarterly report, the secretary stated that complaints as to the depression in trade seemed general all over the Midlands. No serious difficulties with the operatives had been reported. Negotiations were going on in several associations in regard to notices of alterations of rules, especially as to hours of work.

Reference was made to the last half-yearly meeting of the National Federation. Mr. F. H. Fish (Nottingham) had been appointed a member of the National Council, in place of Mr. J. Wright, who, as treasurer, was now an ex-officio member.

During the quarter the secretary had met the members of the following associations:—Mansfield, Burton-on-Trent, Leicester, Redditch, Bromsgrove, West Bromwich, and Stourbridge.

The third annual conference of Midland Centre secretaries was held in Birmingham on March 25th. The president took the chair, and representatives were present from Long Eaton, Burton-on-Trent, Derby, Birmingham; Nottingham, Stourbridge, and King's Norton. Mr. A. G. White, the National secretary, gave an address, in which he stated that the essentials of success in the working of a builders' association were, in his opinion, a proper set of rules, such as the model set; an adequate basis of finance such as the model set provides; the intertrading rule and its co-relative the telephone card, in full operation; and an active carrying out of the objects and rules as indicated in the model set. Mr. White also dealt with the following matters:—The excessive proportion of specialist and p.c. sums in quantities, the waste of money due to the development of competitive tendering, the cutting of prices in slack times, and the co-operative purchase and cartage of materials such as already exists among the master masons and bricklayers of Paris. The address was a very suggestive one, and gave rise to a most interesting discussion.

The following matters were also discussed:—The intertrading rule, the "Builders' Journal," and the practice of architects in asking for priced quantities to be supplied with tenders. The secretary's report was received and ordered to be entered in the minutes.

The secretary was instructed to inform the National Secretary that the following associations approved of the existing contract form, and had no amendments to suggest:—Long Eaton, Mansfield, Burton-on-Trent, Nottingham, Bromsgrove, Leamington, Walsall, King's Norton, Leicester, and Northampton.

The suggestion of the National Secretary that a note should be placed on Federation and Association note-paper to the effect that the "Builders' Journal" was the official organ of the Federation, was adopted so far as the Midland Centre is concerned, and recommended to local associations.—Fred. W. Amphlet, Secretary.

LOCAL ASSOCIATIONS AFFILIATED TO THE MIDLAND CENTRE.

BROMSGROVE AND DISTRICT ASSOCIATION.

Secretary: Sydney J. Brazier.

The third annual dinner in connection with the Bromsgrove and District Association was held at the Golden Cross Hotel, Bromsgrove, on Thursday evening, March 4th, the president (Mr. D. Edwards) being in the chair, and the vice-president (Mr. W. J. Tilt) in the vice-chair. About fifty-five gentlemen were present.

Mr. E. B. Cotton proposed the toast "Success to the Bromsgrove and District Master Builders' Association." He was very glad to know that this association was steadily increasing in numbers, and this was evidence that it was doing good work amongst the trades. He believed the association did a great deal of good in settling small disputes between masters and men, and if that conciliatory spirit could be extended to other trades, a great deal of litigation would be saved. The chairman, whose name was coupled with the toast, said that it gave him much pleasure to respond on behalf of his fellow members. If there was a young fellow present who wished to become a practical builder, he would advise him to learn the trade as a bricklayer and a joiner, and in his opinion, there was nothing to equal the joiners' shop as a means of practical education.

Mr. A. Brazier submitted "Kindred Associations." He said that the more he saw of the work of the association, the more he approved of it, for it brought them together as one of the largest bodies of employers, to protect their interests and those of their employees. Conciliation Boards were a great source of usefulness; he thought that every man who sat on those boards should go to the meetings with an open mind to do what was fair to both parties. Mr. F. W. Amphlet, whose name was coupled with this toast, said that the membership of the association was considerable for a town the size of Bromsgrove. The object of the Federation was to embrace all the builders of the country. They sought to embrace in their ranks all branches of the trade, whether engaged as large employers of labour or as smaller men, whether actually engaged in the trade or belonging to some trade allied with the trade. He was very glad that a local Conciliation Board had lately been formed, which would deal with any dispute between masters and men in the first instance, and in case of a non-settlement, the matter would be referred to the Midland Conciliation Board, and from there to the National Conciliation Board, so that it could be seen that each time the cases were brought before a different tribunal outside the influence of local prejudice. He was pleased to know that the insurance scheme adopted by the Midland Centre had been well taken up by several members, but he hoped every member would do so, as it was an entirely unrestricted policy at a very reasonable rate, and members could easily save their subscription to the association by its use. He added that every member should subscribe to "The Builders' Journal," the official organ of the Federation, which had proved a great success. Interesting news from all parts appeared regularly in its pages.

The vice-chairman, in submitted the toast of "The Architects and Surveyors," remarked that his experience was that architects always acted fairly between builder and client. Mr. Smith, whose name was coupled with the toast, said he hoped next year to have a more satisfactory report with respect to the number of buildings erected in the district.

Mr. J. Brazier proposed the health of the "President and Vice-President, who replied.

The health of "The Visitors" was proposed by Mr. A. H. Godsall, and Mr. W. Pike replied.

THE SOUTH-EASTERN CENTRE OF THE NATIONAL FEDERATION.

Secretary: T. Costigan, 31 & 32, Bedford Street, London, W.C.

LOCAL ASSOCIATIONS AFFILIATED TO THE EASTERN COUNTIES FEDERATION

NORWICH AND DISTRICT ASSOCIATION.

Secretary: J. H. Hatch.

On Thursday, March 18th, the annual meeting of the Norwich and District Master Builders' Association took place at Victoria Chambers, Bank Plain, Norwich. The president (Mr. W. Stacey Daws) occupied the chair, and was supported by the vice-chairman (Mr. B. E. Scarles) and other members of the association.

The report of the committee states that the balance-sheet for the year ending December 31st, 1908, showed for the first time in the history of the association a small deficit, due, however, to special circumstances. Three new members were elected during the year, and it is believed that several building-trade employers might be willing to join the association if members personally interested themselves in securing them. The committee are pleased to report that the rules of the plasterers and the masons have been revised, and agreed upon for a period expiring March 1st, 1911. Very important trade questions were brought to the notice of the committee during the year affecting the contract for building a new secondary school in Norwich. Considerable attention was given to such questions, and it is satisfactory to report that certain modifications were made in the terms of the contract, although not to the extent hoped for.

The members of the association again visited the beautiful grounds of Mr. Charles W. Daws, of "Riversdale," Wroxham, on July 8th, and a most enjoyable afternoon was spent, and the thanks of the association are tendered to Mr. Daws for placing his grounds at their disposal.

The committee regret that during the year the association lost three of its most prominent members by death, viz., Mr. John Hurn, Mr. G. E. Hawes, and Mr. Charles Payne. The two former had occupied the presidential chair, while Mr. Payne had for several years served as a member of the committee. The association was represented at the funeral of each, and letters of sympathy were sent to the bereaved widows and families.

The report, which was moved by the chairman, was adopted unanimously. The following officials were then elected for the ensuing year:—President, Mr. B. E. Scarles; vice-chairman, Mr. W. G. Crotch; treasurer, Mr. J. S. Smith; committee, Messrs. W. E. Bird, W. S. Daws, G. A. Hawes, J. W. King, R. A. Pank, W. T. Scarles, and J. Young; secretary, Mr. J. H. Hatch.

Several matters were discussed and disposed of.

THE MASTER BUILDERS' ASSOCIATION OF NEW SOUTH WALES.

The annual report for the year ending January 19th, 1909, of the Master Builders' Association of New South Wales opens with a jubilant note that is in refreshing contrast to the dismal records of bad trade to which we have been too long accustomed in this country. It is with a great deal of pleasure and gratification, the committee say, that they present the annual report for the year now closing, which has probably been one of the busiest years for the building trade in the history of the State, certainly the busiest of the past fifteen years. The year 1908 has been one of the best years the association has known since the early years following its incorporation.

It is now twelve months since the association occupied its new premises, and the result is a complete justification of the wisdom and foresight of those members who initiated the movement and carried it through to its successful completion. The comfort and convenience of the association rooms have been thoroughly appreciated, and the offices in the building have been all let to good tenants, the major portion of whom are connected with the building trade.

At the close of the first half-year the association was enabled to purchase the building from Builders' Exchange, Limited; the shareholders voluntarily resigning any claim to interest (for which they deserve the hearty thanks of the association), the price paid by the association was below the actual cost. At the close of the year, the first year of occupation, the committee was able to reduce the mortgage by £500.

Thirty-four new members have been added to the rolls of the association since January, 1908, a higher total than during any recent years, which, when allowance is made for the members lost by death, retirement, or other causes, means a net increase of 12½ per cent. in the membership for the twelve months. There has also been a gratifying increase of membership in the Exchange.

During the year there have been many notable additions to the architecture of Sydney in course of erection. Warehouses, shops, and office buildings have been altered, added to, and, in many cases, entirely rebuilt on a larger scale, and in more modern style. There are also several important buildings about to be erected, so that, as far as the city is concerned, the new year is starting well, and promises to be as good as its predecessor. In the suburbs, building operations have somewhat exceeded in number those of the previous year, and there appears to be no immediate prospect of any slacking off.

From enquiries made, it appears that the output of bricks from the principal brickyards during 1908 exceeded the output of 1907 by between 5 and 6 per cent. By referring to the reports of the past two or three years, it will be seen that the output has been increasing steadily since 1904.

A report received from the Metropolitan Board of Water Supply and Sewerage shows that the new buildings erected during 1908 in the city were 199 in number, of an assessed annual value of £45,385. This is a decrease in number, but an increase in value, as compared with 1907—211 buildings, annual value of £34,603. In the suburbs the number of buildings was 4,069, annual value £152,449, an increase in number, but a decrease in value, as compared with 1907—4,045 buildings, annual value £156,382. The total for the area within the jurisdiction of the Board for 1908 is 4,268 buildings, of an annual value of £197,834. This information affords a useful means of comparison of the activity in the building trade from year to year.

One of Sydney's leading daily papers recently set forth that the value of the building operations in city and suburbs during the year totalled in round figures £5,000,000. The committee are of the opinion that this estimate is too high, and regret that the various municipalities and councils have not yet followed the excellent example of the South African towns by keeping records of the number of buildings erected within their borders, the chief materials used in construction and total value of each building.

There is also one feature of the trade that must not be overlooked, viz., that, though the year has been a busy one for the master builders, it has by no means been one of unclouded prosperity. In many trades the prices of materials have been increased, while the competition has been so keen that prices obtained by builders have not increased *pro rata*, with the result that the builder is really doing more work for relatively less money. The amount of work going on has, no doubt, tempted many to start building on their own account, and some to come here from other places, so that the competition is really keener, if anything, than before.

The amount of public works let out by contract is keeping up well, and the Government promises several large and important works to be tendered for shortly, so that those members who are accustomed to Government work should be kept fairly busy during the new year. There is, however, one matter that is not so satisfactory, and that is the number of tenders opened and held over "to be reported on." It appears to the committee that the system of estimating adopted in the Government Architect's Department must be radically wrong, when, after keenest competition among tenderers, the lowest tender is much above the departmental estimate. This is evidently recognised by the department itself, for the assistance of the committee has been sought by the department to entirely recast the printed schedules which in Government works are made part of the contract for valuing extras or deductions.

The ever-recurring day labour question has again forced itself on the notice of the association. There is no doubt that this system is a direct form of State Socialism. To the average citizen the word "Socialism" seems a thing apart; recent events, however, have brought most forcibly before the public the aims of Socialists. Not only have the aims been clearly stated, but the means whereby they are to be achieved should now be familiar to all. It is for the public to judge—it is for the public to say whether the Government shall, in its methods of carrying out public works, largely endorse a system that it has to suppress in other directions. This association has spoken with no uncertain voice on the matter; years ago it pointed out the evils of the system, and every contention made by the association has been proved, beyond a doubt, to be correct. It is the intention of the association to continue in its opposition to the system, believing that it is absolutely inimical to the public welfare.

The efforts of the Government to induce the right classes of emigrants from Great Britain to make their homes in New South Wales have been crowned with a fair amount of success. Large numbers of farm hands and domestic servants have been brought here on assisted passages, and work generally found for them, while others of the farming class have been settled on the estates subdivided privately or by the Government. The advertising done by the State, and by the Immigration League, has also had the effect of attracting workmen in the building and allied trades, most of whom have applied to, or been sent to, the association and to individual members for work.

(*To be Concluded.*)

The Society of Ordained Surveyors held their eleventh annual general meeting on Monday last, in the rooms, 117, George Street, Edinburgh, when it was shown that the funds of the Society at the close of the financial year amounted to rather more than £500.

Trade and Craft.

The "O.S. Wiring System."

Messrs. Siemens Brothers and Co., Ltd., whose head office is now at Caxton House, Westminster, gave at that address, on Friday last, a demonstration of the "O.S. Wiring System," which has been devised with the object of meeting the demand for an inexpensive, efficient, and durable system. The firm has taken up a licence for the sale of "Kalkos" conduits and fittings, which are made of tinned brass or other metal, so proportioned that they follow rapidly sudden changes of atmospheric temperature. Hence no moisture collects in the conduits and fittings, and the wires do not perish. Moreover, as the system, in the course of erection, is soldered throughout, the conduit can be used as the earthed return of a concentric system, thus saving the return wire and allowing of a reduction in the size of the conduit. The "Kuhlos" and "Stannos" Metacase conductors, which, while flexible, are watertight, electrically continuous, and mechanically protected, are comparatively inexpensive. Kuhlos wires are cased with plain or tinned brass or copper, and Stannos wires are cased with tinned copper; rubber insulation being, of course, inserted in each instance. These, with the Kalkos conduits and fittings, make up the "O.S. Wiring System," which is therefore adaptable to every system of wiring, from high-class concealed work to the less expensive surface work.

The cathedral at Pienza, near Siena, is reported to be in grave danger. Some of the walls are "hanging without foundations, there being instead cavities from 10ft. to 12ft. deep, the walls holding together no one knows how." The cathedral is described as a "gem of the Renaissance," and it is hoped that the efforts to save it from destruction will be successful.

* * *

The summer meeting of the Institution of Mechanical Engineers will this year be held in Liverpool, and will begin on Monday, July 26th, concluding on Friday, July 30th, with excursions to Chester and Penmaenmawr. During the week meetings for the reading and discusion of papers will be held in the lecture hall of the Municipal Technical Schools, where, on Tuesday, July 27th, the Lord Mayor will receive the Council and members of the Institution. The Institution dinner will be held on the evening of that date, at the Exchange Station Hotel. Visits to many important works in the district have been provisionally arranged.

* * *

An important amalgamation of labourers' unions is worth noting. An agreement, which has been signed by ten societies, provides for the mutual recognition of each other's cards of membership, transfer of members from one society to another in the case of men changing their employment, mutual help in work, organisation of joint action in case of disputes, and, where disputes arise among unions, arbitration as a means of settlement. The societies which have given their adhesion to the agreement are: United Order of General Labourers of London; Workers' Union; British Labour Amalgamation; Navvies', Builders' Labourers', and General Labourers' Union; Dock, Wharf, Riverside, and General Workers' Union; Amalgamated Society of Gas Workers; Brickmakers and General Labourers; Amalgamated Association of Tramway and Vehicle Workers; National Amalgamated Union of Labour; National Union of Gas Workers and General Labourers. These unions have a membership of over 100,000. The agreement is the result of the action of the General Federation of Trade Unions, which was instrumental in the formation of the General Labourers's National Council, of which Mr. G. N. Bell was appointed secretary, and the promoters of the agreement hope that it may lead the way to complete amalgamation.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 8. EASTER COLTFIELD, ALVES.—Mason, carpenter, plumber, slater, plaster, and painter works of cottages to be erected at Easter Coltfield, Alves. Plans and specifications with John Witter, architect, Elgin, to whom tenders are to be sent by April 8.

April 8. MOURNEABBEY, CO. CORK.—Erection of a parochial house at Mourneabbey, for the Rev. J. Linehan, P.P. Plans, etc., at the offices of the architect, Mr. Samuel F. Hynes, F.R.I.B.A., 5, South Mall, Cork. Tenders to be sent in by April 8.

April 8. DEWSBURY.—Erection of three houses at Northfields, Dewsbury. Plans and specifications and bills of quantities of the architects up to April 8, on which day before 3 p.m., tenders are to be sent to Kirk, Sons, and Ridgway, F.R.I.B.A., architects, surveyors, and valuers, Market Place, Dewsbury.

April 8. WEST AUCKLAND.—Erection of a church hall at West Auckland. Plans and specifications, and all particulars, of F. H. Livesay, architect and surveyor, Newgate Street, Bishop Auckland, up to April 8, on which day tenders are to be delivered to the Rev. J. Roscamp, the Vicarage, St. Helen's, Auckland.

April 8. PENMAIN, NEAR BLACKWOOD, MON.—Erection of forty houses at Penmain, for the "Oakdale Building Club," Secretary, W. Phillips, Pontllanfraith. Plans and specification at the offices of the architects. Tenders by April 8 to Webb and Davies, joint architects, High Street, Blackwood, Mon.

April 8. PONTYPRIDD.—Erection of three shops, with offices over, at Mill Street, Pontypridd. Plans and specification and bills of quantities at the offices of the architects on deposit of £2 2s. Tenders, endorsed "Tender for Shops," by April 8, to A. O. Evans, Williams, and Evans, architects, Pontypridd.

April 8. WINDSOR.—Erection of a wood refreshment house on an island in the Thames, for the corporation. Plan and specification and form of tender of the borough surveyor and E. A. Stickland, Alma Road, Windsor. Tenders, endorsed "Tender for Refreshment House," by April 8, to C. Cecil Durant, clerk, 2, Park Street, Windsor.

April 8. BRISTOL.—Construction and maintenance for twelve months after completion of (1) a steel-framed building covered with galvanised corrugated iron, (2) a small brick building, (3) a small wooden office, for the docks committee. Specification, schedule, form of tender, and form of contract, and copies of contract drawings, of W. W. Squire, engineer, engineer's office, Cumberland Road, Bristol, on production of a receipt, deposit £3. Tenders, endorsed "Tender for Sack Shed, etc.," by 3 p.m., on April 8, to secretary of the docks committee, docks office, 19, Queen Square, Bristol.

April 9. NEWMACHAR (SCOTLAND).—Mason, carpenter, slater, and cement works of reconstruction of steading at Brownhills, Elrick, Newmachar. Plans and specifications with Burnett and Reid, 12, Golden Square, Aberdeen, with whom tenders are to be lodged by April 9.

April 9. HAVERFORDWEST.—Work at the old county prison, Haverfordwest, and alterations, painting, and drainage work at the police station, Milford Haven, for the Pembrokeshire C.C. Plans and specifications and all particulars upon application to Arthur H. Thomas, assistant county surveyor. Tenders to be delivered by April 9.

April 10. GILSLAND.—Erection and completion of a house at Gilsland. Plans, etc., at 3, Stanley Crescent, Gilsland. Tenders by April 10, to Thos. Routledge.

April 10. CARLISLE.—Various trades in alterations to premises in St. Cuthbert's Lane, Carlisle, for J. Martindale. Names stating trades before April 10, to J. H. Martindale, F.R.I.B.A., architect, Eaglesfield Abbey Rooms, Castle Street, Carlisle.

April 10. SUTTON-ON-SEA.—Erection of Wesleyan Church and school-rooms at Sutton-on-Sea. Particulars and bill of quantities from John Wills and Sons, architects, Victoria Chambers, Derby. Application before April 10, must be accompanied by £1 1s. deposit.

April 10. TRURO. — Completion of the tower, from plans and specifications supplied by E. Sedding, architect, for the vicar of St. Paul's Church, Truro. Plans, etc., at the Vicarage, up to April 7. Tenders by noon on April 10, to the Rev. W. G. Kerr.

April 10. ELGIN.—Mason, carpenter, slater, plumber, plaster, and painter works of additions and alterations at Murrayfield, Elgin. Plans and specifications with John Wittet, architect, Elgin, to whom tenders are to be sent by April 10.

April 10. CLWTYBONT.—Alterations to Caledffrwd, Clwtybont, for Dr. D. R. Evans. Plans and specifications, etc., at Caledffrwd or at the office of the architect. Tenders by April 10, to Ellis F. White, architect and surveyor, 17, Bridge Street, Carnarvon.

April 10. CROOKHILL.—Extension of shop premises at the Crookhill branch of Blaydon Co-operative Society. Plans and specifications at the office, Blaydon. Tenders, endorsed "Crookhill Branch," to be sent to the office, Blaydon, by the morning of April 10.

April 10. GLENCRAIG.—Brick, joiner, plumber, plaster, and slater works of proposed licensed premises, Glencraig, for John Hunter. Plans and specifications and all other information on application to James T. Scobie, architect, Dunfermline and Lochgelly. Estimates with the proprietor, 5, Douglas Street, Dunfermline, by April 10.

April 10. WELLING (KENT).—Erection of a branch public library in Bellegrove Road, Welling, for the Bexley U.D.C. Plan and sections, and specification, general conditions, and form of tender, of Thos. G. Baynes, clerk, council offices, Bexley Heath, Kent, upon deposit of £1 1s. Tenders, endorsed "Tender for Welling Public Library," to the clerk by noon on April 10.

April 10. ABERSYCHAN (WALES).—Erection of a building to be used as a drinking fountain at Leigh Road freehold land, for the U.D.C. Plans and specifications at the office of W. H. V. Bythway, clerk. Tenders, endorsed "Drinking Fountain," to be sent to the clerk by April 10.

April 10. DUNGIVEN (IRELAND).—Alteration and extension of church, for the committee of Dungiven Presbyterian Church. Principal parts of the work will consist in constructing screens and building a concrete front. Plans and specifications with Rev. Andrew Gibson, B.D., or Samuel Macartney, architect, Dungiven. Tenders with Patterson Boyle, secretary, by April 10.

April 12. MARTOCK.—Erection of a Ham stone wall at Ash Churchyard, Martock. Particulars at vicarage. Tenders to Churchwardens by April 12.

April 12. GELLIGAER.—Erection of 30 or more cottages at Gelligaer village for the Cascade Building Club. Plans and specifications may be seen at the office of Wm. Harris, architect and surveyor, Bank Chambers, Bargoed. Tenders by April 12, to the secretary, E. I. Phillips, A.A.I., High Street, Bargoed.

April 14. DARTFORD, KENT.—Cleaning and painting works and repairs at Darenth Asylum, Dartford, for the Metropolitan Asylums Board. Drawing, conditions of contract, bills of quantities, specification, and form of tender, at the office of the Board, Embankment, E.C., upon deposit of £2. Tenders, by 10 a.m. on April 14.

PLUMBING & SANITARY

April 17. LINLITHGOW.—Construction of about 5 miles of 6in. to 18in. sewers and relative works, for the Bathgate District Committee. Plans, specification, and schedule at the office of Middleton, Hunter and Duff, MM.Inst.C.E., 42, Frederick Street, Edinburgh, on deposit of £1. Tenders, endorsed "Uphall and Broxburn Drainage," by April 17, to J. G. B. Henderson, district clerk, Linlithgow.

April 19. MARLOW, BUCKS.—Construction of bacterial contact filters, pump well, engine house, outfall to river, and other works for the treatment of brewery discharges at Marlow, Bucks., for Thomas Wethered and Sons, Limited. Drawings and specification and form of tender and copy of quantities at the office of William Fairley, civil engineer, 69, Victoria Street, Westminster. Tenders to be lodged with the engineer by April 19.

April 19. EASTHAM.—Construction of sewers and appurtenant works in Church Lane and Stanley Road, in the township of Eastham, for the R.D.C. The work will consist of about 430 lineal yards of stoneware pipes varying in diameter from 12in. to 6in. Drawings and specification of the engineers, Priest and Ellis, M.Inst.C.E., 13, Harrington Street, Liverpool, from whom copies of the specification, form of tender, and bill of quantities may be obtained on deposit of £1 1s. Tenders before 9 a.m. on April 19, to J. E. S. Ollive, clerk, 54, Hamilton Street, Birkenhead.

April 24. ROTHBURY.—Construction of about 4,100 lineal yards of 9in. and 6in. earthenware and cast-iron pipe sewers (including about 200 lineal yards in heading), together with manholes, inspection shafts, river crossing, detritus and settling tanks, bacteria beds, and other incidental works, for the U.D.C. Plans, sections, and specifications and bills of quantities with form of tender from C. Franklin Murphy, A.M.I.C.E., civil engineer, Newgate Street, Morpeth, on deposit of £5. Tenders, endorsed "Tenders for Sewage Works," by April 24, to George Nicholson, clerk, council offices, Rothbury, Northumberland.

May 4. LONDON.—Construction of a brick sewer, 6ft. internal diameter and 7,180ft. in length, in the Borough of Paddington, for the L.C.C. Drawings, specifications, bills of quantities, form of tender, and other particulars on application to the chief engineer, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon deposit of £10 with the cashier of the council. Fair wages clause. Tenders to the clerk of the L.C.C., Spring Gardens, S.W., and marked "Tender for Extension of Middle Level Sewer, No. 2, to County Boundary at Willesden," by 11 a.m. on May 4.

ROADS AND CARTAGE.

April 8. WAKEFIELD.—Construction of roads at South Kirkby Collieries, near Wakefield. Plans and specifications, and bills of quantities at the Pontefract office of Garside and Pennington, surveyors, etc. Tenders endorsed "Roads at South Kirkby," to be forwarded to the South Kirkby, Featherstone, and Hemsworth Colleries, Ltd., Ropergate House, Pontefact.

April 8. MORLEY.—Supplying the following materials during the year ending March 31, 1910, for the Corporation:—Broken granite, Yorkshire setts, flags; and kerb, sewer and drain pipes, Portland cement, pitch and creosote oil, manhole and ventilating covers, gully grates and frames, lime, sand, scavenging brooms and for refilling, stocks of machine brushes. Forms of tender and any further information on application to W. E. Putman, Assoc.M.Inst.C.E., borough engineer and surveyor, town hall, Morley. Tenders, endorsed "Tender for —," to the town clerk, F. Thackray, by April 8.

April 10. TAMWORTH.—Supplying broken granite for the year ending March 31, 1910, for the Corporation. Tenders, endorsed "Granite," by April 10, to F. E. G. Bradshaw, borough surveyor, Municipal offices, Tamworth.

April 10. LEEDS.—Paving and flagging the following streets, for the Corporation: Arthur Street, Back Nice Road, Marian Road, Back Marian Road, Marian Mount, Marian View, Marian Avenue, Cyprus Place, Back Cyprus Place, Cyprus Mount, Melville Mount, and Back Cobden Place. Also macadamising and flagging the improvement in Harrogate Road, and paving Mill Hill. Drawings of the private streets at the city engineer's office, Municipal Buildings. Forms of tender and bills of quantities and contract on application at the highways office, 155, Kirkstall Road. Tenders, endorsed "Tender for Street Work," by 10 a.m. on April 10, to town clerk's office, town hall, Leeds.

April 12. GELLIGAER.—Forming and metalling a new road at Gelligaer village for D. Williams and Co., Taff Vale Brewery, Merthyr Tydfil. Plans and specifications, with Wm. Harris, architect and surveyor, Bank Chambers, Bargoed. Bills of quantities on deposit of 10s. 6d. Tenders, endorsed "New Road," by April 12, to Frank James and Sons, solicitors, Merthyr Tydfil.

April 13. CHORLEY.—Supplying the following materials for year ending March 31, 1910, for the R.D.C.:—Broken granite and slag, rubble, chippings, setts, kerbs, tools, implements, etc. Particulars and forms of tender of Percy Whalley, highway surveyor, Gregson Lane, Hughton, near Preston. Tenders by April 13, to John Whitfield, solicitor, clerk for highway purposes, 10, High Street, Chorley.

April 14. HAMPSTEAD.—Paving with creosoted deal a portion of Constantine and Agincourt Roads, for the Corporation. Area about 2,275 square yards. Specification of O. E. Winter, A.M.I.C.E., town hall, where form of tender, with full conditions, can be obtained. Tenders by 9 a.m. on April 14, to Arthur P. Johnson, town clerk, town hall, Hampstead.

April 14. CARSHALTON. — Laying limestone tar paving, relaying and providing kerbing, and incidental works, at North Street, Waterloo Road, and The Beeches, for the U.D.C. Bills of quantities from the surveyor, Wm. Willis-Gale, A.M.I.C.E., at the Council Offices. Tenders, marked "Tar Paving," by noon on April 14, to C. P. Lovelock, clerk, district council offices, The Square, Carshalton.

April 19. YORK.—Supplying about 52,000 tons of broken stone, or about 47,000 tons of broken slag, in one year; or about 256,000 tons of broken stone, or about 232,000 tons of broken slag, to be supplied over five, or less, years, for ballasting purposes, for the North Eastern Railway. Specification and form of tender on application to W. J. Cudworth, the company's engineer, at York. Tenders to the secretary, endorsed, "Tenders for Stone Ballasting," by 9 a.m., on April 19.

April 20. ALTON.—Materials and steam rolling during the year ending March 31, 1910, for the R.D.C. Specifications and forms of tender from the surveyor, William McIntosh, Alton, Hants, on the receipt of a stamped and addressed envelope. Tenders by April 20, to A. F. M. Downie, clerk.

April 23. LONDON.—Road repairing and tar paving work, etc., at the Northern convalescent hospital, Winchmore Hill, N., for the Metropolitan Asylums Board. Drawing, conditions of contract, specification, and form of tender, at the office of the Board, Embankment, E.C., upon deposit of £1. Tenders by 10 a.m. on April 23.

April 26. WANDSWORTH.—Making-up and paving part of Acuba Street, Southfield, for the corporation. Specification and drawings, and forms of tender, at the borough engineer's office, new streets department, 56, East Hill, Wandsworth, S.W. Tenders, endorsed "Tender for Paving Acuba Street," at the Council House, East Hill, Wandsworth, S.W., by 4 p.m. on April 26. Fair wages clause.

MISCELLANEOUS.

April 8. MERTHYR TYDFIL.—Providing and fixing vestibule or inner doors and letter-box slits and plates to 88 houses, to workmen's dwellings at Penywern and Twynyrodyn, for the corporation. Particulars and forms of tender from the borough engineer. Tenders, endorsed "Workmen's Dwellings," to T. Aneuryn Rees, town clerk, by April 8.

April 17. LONDON.—Supplying furniture and fittings at the New Central Library, for the Corporation. Applicants must state similar work executed by them. Names by April 17, J. Percy Shuter, town clerk, town hall, Fulham, S.W. Of the limited number selected to compete a deposit of £2 2s. will be required.

Appointments Wanted.

The charge for Advertisements under this heading 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ABLE architect prepares designs, perspectives, working drawings, etc., on moderate terms.—W., 6, King's Road, Kingston-on-Thames. 4918

ABLE ASSISTANCE rendered, drawings, tracings, photo-prints prepared, plans from rough sketches, specifications, etc.—Yorkshire Drawing Office, 21, Scale Lane, Hull. 4940

ARCHITECT'S Assistant (24), disengaged; Inter. R.I.B.A.; 6½ years' varied experience; working drawings, details, and perspectives, levelling; assist with quantities; shorthand and typewriting; excellent references. — S. Riches, 35, Culverden Road, Balham, S.W. 4963

ADVERTISER (20), three years with Quantity Surveyors, wishes to enter Builders' Office (preferably estimating department); excellent testimonial; very low commencing salary, with good prospects. —E., 2, St. Mary's Road, London, S.E. 4960

APPOINTMENT as Improver (19), prob. R.I.B.A., just completing three years' articles with an architect and surveyor; small salary to commence; highly recommended.—H. Cullerne, "Bridge House," Lugwardine, Hereford. 4911

ARCHITECT'S Assistant (28) seeks situation; thoroughly competent in all design and construction, including steelwork and ferro-concrete; details, specifications, quantities, surveying; eleven years' experience; manage office; permanency preferred; excellent references.—Apply, at first, Box 4954, Builders' Journal Office.

ARCHITECTURAL Draughtsman, thoroughly experienced in designing steel and ferro-concrete work, factory chimneys, retaining walls, foundations, overhead gantries, and all constructional work is open to assist or consult architects by correspondence.—Box 4927, Builders' Journal Office.

ARCHITECT and Surveyor's Assistant (25), 9 years' experience; excellent draughtsman, working drawings, details, specifications, perspectives, surveying, French, typewriting; moderate salary.—Arthur Bailey, 26, North Street, Hailsham, Sussex. 4819

ARCHITECTS, Builders, etc., draughtsman (19), used to general work, fill up time in office; good references.—F. J. Williams, c/o F. Cundall, Architect and Surveyor, 34, Parade, Leamington Spa. 4878

ARCHITECT'S Assistant (22), six years' experience; student R.I.B.A., good draughtsman, contract drawings, details, surveying, etc.; assist with quantities; salary moderate.—J. J. S., 1, Silver Street, Stockton-on-Tees. 4888

ARCHITECT'S Assistant (27), excellent draughtsman and colourist; contract drawings, specifications, details, design, perspective, surveys, etc.; travelling studentship winner; highest refs.—Box 4902, Builders' Journal Office.

ARCHITECT'S Assistant (23) desires engagement, town or country; excellent draughtsman; good general experience; first-class references.—Box 4937, Builders' Journal Office.

ARCHITECT'S Assistant (26), desires engagement at moderate salary; good draughtsman.—Address, Young, Narellan, Old Colwyn. 4950

ARCHITECT and Surveyor's junior assistant (19), desires engagement; surveying, levelling, etc.; office routine; salary 15s.—Box 4930, Builders' Journal Office.

ARCHITECT'S Assistant (25), R.I.B.A. exam., nine years' thorough practical experience, design, working drawings, details, specifications, estimating, quantities, levelling, perspectives, etc.; sal. moderate.—Apply, Box 4900, Builders' Journal Office.

ARCHITECT'S fully qualified Assistant and Quantity Surveyor, energetic and experienced, desires immediate engagement, temporary or otherwise; competition expert; highest references; salary moderate.—W. B., 156, Warwick Road, Birmingham. 4935

ARCHITECT'S Junior Assistant disengaged, 4½ years' articles, wishes to meet with architect in Lancashire office; specimen drawings, certificates for construction; sitting for Inter. R.I.B.A., June.—Apply, J. S. H., Wittington Lane, New Springs, Wigan. 4815

ASSISTANT A.R.I.B.A. (29), 14 years' London and Provincial experience; working drawings, details, specifications, supervision, perspectives, assist quantities, well up in management; testimonials; references; salary, 2 guineas.—Apply A, 31, Cotswold Road, Westcliff-on-Sea, Essex. 4775

ARCHITECT'S Junior Assistant, 5½ years' experience; disengaged; working and detail drawings, typewriting, knowledge of perspective; moderate salary.—W. L. Francis, 11, Middleton Road, Ilkley, Yorks. 4891

ARCHITECTS, and builders, experienced surveyor open to prepare quantities and estimates, check accounts and measuring; moderate terms.—Apply Box 4817, Builders' Journal Office.

ASSISTANT Surveyor seeks re-engagement; 9 years with City firm; highest testimonials; surveys, levels, estate management, etc.; shorthand if required; moderate salary.—K., 21, First Avenue, Manor Park. 4917

ASSISTANT, provincial experience, good planner and designer, domestic Renaissance, working drawings, details, surveying, competitions; excellent draughtsman, A.R.I.B.A. at one sitting; age 27.—Box No. 4928, Builders' Journal Office.

BUILDERS' Assistant desires situation; thorough knowledge plans, specifications, quantities, measuring; not afraid of work; salary not so much an object as permanent situation; 21; 5 years' experience.—Box 4839, Builders' Journal Office.

BUILDER and contractor's estimating and managing clerk seeks berth, exceptionally good all-round qualifications, acquired by sound London and provincial experience, and a reliable and successful estimator, including sewerage and kindred works; good references.—T. C., 3, Hampton Terrace, Brighton. 4933

BUILDER'S or Architect's Junior Assistant (18), good tracer, well up in prime cost, and general office work; excellent references; three years' experience. — J. W., 164, Wellesley Road, Ilford, Essex. 4833

BUILDER (38), life experience, seeks engagement as Building or Estate Clerk of Works or Builders' General Foreman; thorough knowledge of plans, details, quantities, and accounts; accurate setting out; good manager all trades.—Box 4958, Builders' Journal Office.

BUILDING Exhibition.—Young architect is prepared to assist exhibitors at the above; can reach same daily; terms low.—Box 4925, Builders' Journal Office.

BUILDING Trades' Exhibition, 1909.—Gentleman, with wide architectural experience, offers services to provincial or other exhibitors as representative at their stand; for terms apply Box 4931, Builders' Journal Office.

BUILDER'S or Architect's Assistant (25), Inter. R.I.B.A.; neat draughtsman, levelling and surveying; assist quantities, specifications, accounts, and general routine; excellent references; moderate salary for experience. — H. O'R., 80, Lavender Sweep, Clapham Common, S.W. 4973

CARPENTER and Joiner desires sit.; bench, building or estate, or other suitable capacity; experienced; good refs.; age 30.—R. H. W., 24, Thorncroft Road, Fratton, Portsmouth. 4908

CLERK of Works, shortly disengaged; first class; well up in all trades; best London references; abstainer.—R. E., 2, William Road, Guildford, Surrey. 4972

CLERK of Works, desires re-engagement, possessing first-class testimonials for ferro-concrete construction, also from Metropolitan Borough Councils, eminent architects and engineers; age 45.—Box 4922, Builders' Journal Office.

CLERK of Works, shortly disengaged, well up in all trades, best London references; abstainer.—R.E., 2, William Road, Guildford, Surrey. 4938

DRAUGHTSMAN (junior), 5 years' experience in structural engineers, good knowledge of constructional and ornamental work, details, quantities and estimating; shop experience.—M.D., 74, Bartholomew Road, London, N.W. 4884

DRAUGHTSMAN, neat, quick tracer, working drawings from rough sketches, good colourist; shorthand, typing, etc.; about 12 years' varied experience; terms moderate.—Box No. 4889, Builders' Journal Office.

ESTATE, Buildings Manager (33), desires re-engagement; ten years' experience in mills, farms, cottages, etc., including the preparation of plans, quantities, estimates and accounts; good knowledge of timber trade; salary 3 guineas; country preferred; abstainer.—Box 4632, Builders' Journal Office.

FIRST Class Architectural Designer and Draughtsman, artistic and practical, experienced in planning; elevations and details, office and competition work; moderate salary.—Apply Box 4792, Builders' Journal Office.

GENTLEMAN, with office in Glasgow, splendid connection among architects, builders, etc., is open to represent one or two good firms; first-class references given.—Box 4893, Builders' Journal Office.

GRAINING wanted, piecework; distance no object; best work only.—C. Monk, Oakdene, Parkfield Road, Willesden, N.W. 4951

MANCHESTER district, architect's draughtsman gives temporary assistance; experienced planner and designer; contract, detail or competition drawings.—Box 4949, Builders' Journal Office.

OUTDOOR representative, surveyor's assistant (25), disengaged, requires appointment; had experience interviewing, canvassing, knows London well; well educated, and of good address; first-class references.—Box 4952, Builders' Journal Office.

PARTNERSHIP.—Gentleman with practical knowledge, desires post in sanitary engineering business with view to partnership.—Address, Engineer, 1, Creighton Avenue, Muswell Hill, N. 4942

REINFORCED CONCRETE.—Details, drawings, calculations, and assistance generally, rendered to architects, builders, etc., by a specialist of large experience; terms moderate.—Box 4887, Builders' Journal Office.

SURVEYOR'S Assistant seeks re-engagement; 9½ years with municipal engineer; exceptionally good testimonials; well up in surveying, levelling, etc., and all work appertaining to a surveyor's or contractor's office. — Box 4971, Builders' Journal Office.

TO Builders.—Experienced, practical Builder Surveyor undertakes preparation of estimates and settlement of accounts on reasonable terms.—Box 4957, Builders' Journal Office.

TO Manufacturers.—Gentleman, with valuable connection among engineers, railway companies, and contractors, is prepared to undertake London agency for one or two good firms; offices in Westminster; highest references given. -- Box 4967, Builders' Journal Office.

WORKING shop foreman seeks re-engagement; thoroughly practical and reliable carpenter and joiner; abstainer; 7 years' ref.; age 38; wages moderate.—C. M., 16, Margett's Road, Kempston, Bedford. 4932

YOUNG Architect is prepared to assist others, at his own office or otherwise; mod. terms.—Box 4926, Builders' Journal Office.

Appointments Vacant.

A START in Life,—Vacancy for youth as pupil; moderate premium required, in a county architect's office.—Pryer, Clarence Street, Gloucester. 4947

ARCHITECT required to represent a large West End firm of contractors; must be a qualified man and be willing to call upon architects as representative.—Apply Box 4955, Builders' Journal Office.

ARTICLED Pupil—Reinforced Concrete. Required a young gentleman as articled pupil in reinforced concrete specialist's office, one with a knowledge of elementary applied mechanics, and mathematics and a taste for theory of construction and design preferred; an excellent opportunity for one willing to learn and understudy chief engineer.—Write, R. C., c/o Hastings Bros., Ltd., King's Chambers, Portugal Street, Kingsway, W.C. 4907

ARTICLED PUPIL.—Vacancy for same in old established West End firm of architects and surveyors; moderate premium; small progressive salary to suitable youth.—Box No. 4890, Builders' Journal Office.

OFFICE Boy wanted, by a builder, at West End; apply, in own handwriting, stating age, salary, and experience, to Box 4974, Builders' Journal Office.

Box 4897.—This vacancy is now filled up, and advertisers tender thanks to all applicants for letters sent. 4970

WANTED, Joiners' Foreman, for London shop of 20 men; able to estimate and work accurately to cost; used to machinery.—Box 4936, Builders' Journal Office.

JOINTLESS Floor Layers. — Wanted immediately, one or two good men, thoroughly experienced in composition floor-laying.—Apply, giving experience and wages required, Box 4946, Builders' Journal Office.

WANTED, competent reinforced concrete hands, experienced enough to act as sub-foremen.—Write, stating wages required, to D.N., Box 4944, Builders' Journal Office.

WANTED immediately, for Manchester district, competent surveyor, age about 25, for plane and angular surveying and levelling. Must have fair constructional knowledge. Address, stating age, experience, and salary required, to—"S. 31," W. H. Smith and Son, Advertising Agents, Blackfriars, Manchester. 4965

Parliament and Town Planning. The resuscitated Housing and Town Planning Bill was read a second time in the House of Commons on Monday, April 5th, when Mr. John Burns, in moving the second reading, said that the Bill was almost an exact reproduction of the Bill that was read a second time on May 12th last, and that stood the ordeal of twenty-three days' criticism in Grand Committee. An essential feature of the Bill, it was explained, was that it made Part 3 of the Housing of the Working Classes Act, 1890, applicable throughout the country, instead of being merely adoptive. It gave increased facilities for the acquisition of land for housing on small-holding terms. It would enable loans to be obtained from the Public Works Commissioners, up to a period of eighty years at the minimum rate of interest. It would consolidate existing Housing Acts into one measure, giving more efficient machinery at less cost. It would strengthen and simplify the present law as to closing orders and the demolition of slum dwellings. The town-planning portion of the Bill represented a new departure for this country, and Mr. Burns regretted that it had come so late. It was not fair to the poor that "streets should be put the wrong way on, or formed at the wrong angle, that they should be placed where the sun rarely got and the wind always did, and [the seeming paradox disappears on close examination] where ventilation was always denied the inhabitants." The Bill also sought power to abolish underground and cellar dwellings and to prohibit the future erection of back-to-back houses. Mr. Burns (who was at this point interrupted by Mr. Lupton, member for Sleaford, who seemed to favour back-to-back houses, and who had to be reminded that "this was a debate, and not a *conversazione*") agreed with a statement issued by the National Association for the Prevention of Consumption "that back-to-back houses and cellar tenements were unfit for habitation," and he said that eminent medical men, whose names he gave, had represented to him that the death-rate from infectious and other diseases, and lung complaints, was far higher in back-to-back houses than it was in through-ventilated houses. To those who would tell him that some of the provisions with regard to town planning were more arbitrary than they should be, he would reply, in anticipation, that he was perfectly convinced that the Government would be able to meet them in Committee. Mr. Lyttelton, who followed Mr. Burns, criticised the Bill in a very friendly spirit. He thought that the principle of town planning was quite sound. It was lamentable to think of the vast sums that had been wasted on the pulling down of expensive property which had been erected at haphazard, and which those responsible for the development of the town had been compelled to remove. Yet, subject to certain matters being adjusted satisfactorily, he did not think that owners of property need apprehend any loss. The principle of town planning would expand the market for building. Instead of landowners being almost forced to sell, as at present, small parcels of land upon which houses were packed, the tendency of the Bill would be to spread out the zones of the suburbs, and to bring much more land into profitable occupation, and thus, by creating a large area upon which buildings might be erected, to recoup the landlord for the lesser number of houses placed upon the acre. He welcomed nothing more in this Bill than the greater elasticity which it would allow in matters which had become intolerable by reason of the absurdity of rigid cast-iron by-laws; and he claimed for private experiments in planning that they had shown that commercial stability was perfectly consistent with beauty and sightliness, and local amenity generally. With certain details of the Bill, however, he was in disagreement. He thought that it gave the central authority too much power, and he conceived the possibility of that power being exercised against the local wish, and thus bringing discredit and unpopularity upon otherwise beneficent operations. He thought it unwise, also, to make the Local Government Board the appellate body in questions of demolition and the like, and he gave reasons why compensation in such cases should err (if at all) on the side of liberality, the bald value of property being often inadequate and unjust. A most serious defect in the Bill was the absence of any provision for an addition to the staff of the Local Government Board for the purpose of working the measure. The Board must set aside the false economy that might eventually cause the country to lose millions of pounds, and must equip itself sufficiently to be a real guide to the country. That is exactly the contention put forward in these pages at the time when Mr. Burns seemed disposed to deny himself what we regard as the indispensable advice and assistance of the R.I.B.A. Mr. Masterman gave certain reassurances with respect to the augmentation and equipment of the staff; and with regard to the question of preserving commons and open spaces (referred to in another column of this issue) he stated that all reasonable requirements in this respect would be met by amendments to be moved in Committee. The opposition to the Bill, led by Mr. Lane Fox, who moved the amendment, which was lost (20 for, 128 against), was based mainly on financial considerations, fears being expressed that the local authorities would not be able to cope with the burdens which the Bill imposed upon them.

The Prince's Practical Wisdom. The Prince of Wales, presiding at the first meeting of the Royal Commission for the Brussels, Rome, and Turin Exhibitions, made a speech that was not less stimulating than his famous "Wake up, England!" utterance of a few years ago. His Royal Highness, after explaining that the Brussels Exhibition, to be held next year, will represent the first occasion on which His Majesty's Government has taken part officially on an important scale in an exhibition in Belgium; and that the Rome Exhibition (in 1911) will be devoted to arts and archæology, while the Turin Exhibition of the same year will be confined to agriculture, industries, and commerce, referred to the reluctance to take part in foreign exhibitions which has been shown in the past by some of the large firms in this country, and attributed it to the fact that the trouble and cost of preparing an effective exhibit appears to be out of proportion to the direct commercial results obtained in the shape of increased orders. He reminded his hearers, however, that "the extent of the benefit resulting to any particular industry from the display of its manufactures at an exhibition cannot be measured solely by the amount of direct orders received by individual exhibitors." This reminder, stand-renters at Olympia should note, holds good for home exhibitions, where the results, although they are more immediate and direct, are still not always so prompt as to satisfy the less experienced among the exhibitors, who have yet to learn that patience and perseverance are essential to the full fruition of any form of advertising. The Prince added, "In the opinion of the recent Committee of Enquiry, the same causes which render it necessary for individual firms to spend large sums of money on advertisements in order to maintain their position in a particular trade, also render it imperative that every effort should be made at the present day to maintain and improve the reputation of British manufacturers as a whole. Experience has shown that even in the case of firms having an established reputation and world-wide connections, attempts to discontinue advertising have usually been followed by a diminution in the sales effected; and it is not unreasonable to assume that the neglect by Great Britain of one of the most important forms of national advertisement would be equally detrimental to her interests as a manufacturing country." In other words, if we are to prosper, either as individuals or as a nation, our traders must put more faith in the virtues of persistent advertising. Apropos, Sir Thomas Roe has just introduced a Bill to enable local authorities to advertise the attractions and advantages of their districts. But, in spite of high sanction, it is not likely that "the new spirit," as it is somewhat erroneously called, will infect the professional classes. With all our firm belief in advertisement, we shudder at the horrifying idea of the advertising architect. The builders' merchant, however, and the contractor, labour under no such disqualification, and the latter tradesman would find it greatly to his advantage to be much more emulous of the former in making the most of his opportunities in this direction.

Exit Euclid. It is not for nothing that the leaders of modern thought are deprecating "T-square architecture," and are dead against the slightest inclination to "argue in a circle." They are apparently in a conspiracy with the Education Department, which has not hesitated to lay its profane hands on Euclid. In a White Paper (ominous emblem!) that has just been issued by that august body, there are many revolutionary propositions —if it is still permissible to use a word that is instinctively associated with Euclid. Thus it is dogmatically laid down that "Straight needs no explanation, and all attempts at definition are waste of time." It is further alleged that "Progress in geometry does not depend on the memorising of definitions." The mathematician who is staggered by that statement will surely become a practical geometer, by the crude process of "measuring his length on the earth," as the sensational novelist used to phrase it, when he reads this: "Axioms are still less necessary, and the best course is probably never to mention them." Why that weak intrusion of "probably"? It detracts considerably from the uncompromising dogmatism that befits so draconic a pronouncement. This White Book on "The Teaching of Geometry and Graphic Algebra" is intended, we believe, for the regulation of such studies in secondary schools, whence, it may be safely assumed, are drawn most of the recruits for the noble army of architects. Those who are still at school will bless their lucky stars at escape from the soulless drudgery of burdening a reluctant memory with definitions and axioms that are sometimes worse than sterile; for there is undoubted truth in the statement that "Euclid did not write for children, but for men. To commence the subject by proving what seems to them to need no proof is a safe way to make boys think that the whole subject is artificial and unreal." This evil effect has been too often intensified by reason of the well-marked proclivity of teachers of a certain type for emphatic and fatal insistence on unessentials, while leaving their unfortunate pupils to flounder about helplessly *in ignorantio elenchi.* Any reform that shall concentrate the student's attention on principles rather than on futile paradoxes should be cordially welcomed, and will probably go far towards removing that profound distaste for mathematics which is shared by so many imaginative minds. In such cases it is not the pure reason of mathematics that is abhorrent, but the clumsy method of presentment. Oliver Goldsmith's contemptuous reference to "the low cunning of algebra" was merely a reflection on the incompetency of his teachers.

OUR EDITION DE LUXE.

Building Trades Exhibition Number.

The value of the Building Trades Exhibition to all connected with the great building industry is now so generally acknowledged, that we are spared the task of demonstrating its importance to our readers' consideration. The present fixture, which opens on Saturday next, the 17th inst., at Olympia, promises to be the most successful of all those which have been organised under the very able direction of Messrs. H. G. and H. C. Montgomery. The demand for space has been abnormal, and this great hall and its spacious annexe have been taxed to the uttermost to find room for the numerous firms who naturally desire to be represented. For weeks past the exhibition space has been reported as exhausted.

The exhibition may be regarded as one of the most interesting events in the building trade this year, and it is our desire to deal with it in a manner befitting its importance. We have arranged therefore to publish on Wednesday next, April 21st, an Edition de Luxe, printed on art paper, dealing very fully with the various features and exhibits.

Mr. H. Greville Montgomery, M.P., has kindly consented to write an article on the Exhibition, its inception, aims and growth; and we shall also publish short notes on the value of such exhibitions to architects, builders and others, by Sir Aston Webb, R.A., Mr. Mervyn Macartney, F.R.I.B.A., F.S.A., Mr. A. W. S. Cross, M.A., F.R.I.B.A., Mr. Alfred East, A.R.A., Mr. R. Frank Atkinson, F.R.I.B.A., and other well known artists. The proceedings at the opening ceremony and the luncheon will be fully reported, with sketches by our special artist. We shall also give a complete list of the visits of various bodies, arranged up to the time of opening. Among the other contents of special interest will be the revised drawings for the Royal Automobile Club's new premises, Pall Mall—Messrs. Mewès and Davis, architects—now first published.

To deal with the exhibits in a manner at once useful and informative has ever been a trouble in writing about exhibitions, and, after consultation with Mr. Ernest Newton, Mr. Mervyn Macartney, Mr. A. W. S. Cross, and other well-known architects, we have decided upon what we believe is an original and interesting arrangement for this information. The whole of the work of preparing the notices has been entrusted to Mr. Fredk. Chatterton (of Messrs. Chatterton and Couch, AA.R.I.B.A.), who has selected from data furnished by the various exhibitors some particular information about each exhibit which he believes will be of interest and use to his fellow-architects, accompanying each notice by an illustration procured in a similar manner. In the selection and preparation of these particulars and illustrations Mr. Chatterton has had an absolutely free hand. The sectionising and arrangement of them, subsequently, has been carried out by us on a system that will facilitate immediate reference, and will enable readers at the exhibition to find any exhibit with a minimum of trouble.

The Edition de Luxe will be on sale at our stand, No. 23, Row B, on Wednesday, April 21st, the fourth day of the exhibition, which remains open till May 1st.

AMERICAN ARCHITECTURE: WITH ESPECIAL REFERENCE TO WORK AT WASHINGTON.

By Francis S. Swales.

Abstract of a paper read before the Royal Institute of British Architects, Monday, March 15th, 1909.

(Concluded from page 292, No. 739.)

An Artist's Idea Achieved.

Walter's plan consists of three blocks. The central one which embodies the needs and aspirations of the formative period of the American nation; of two newer ones, a north wing and a south wing containing the two houses, each linked to the old block—the old home of both houses. It is indubitably a practical arrangement, designed to afford the best lighting to the new wings and to shut out as little as possible from the old structure; but I like to think that it is something more than all that—that there is a beautiful symbolism about it—an artist's idea achieved. That from the beginning Walter saw the two houses—the Northern States and the Southern States — widely separated, housing two different representation of the people, yet each essential to the existence and continuance of the other. That he saw in the old building the expression of a half century of common effort and common accomplishment founded upon the old plan representing the Constitution of the United States; common ideals crowned by that ornament of achievement, Unity, represented by its dome. First he planned and constructed the two wings and linked each to the old building—the two great wings of white marble were seen to predominate—to assert their importance over the old structure. He then proposed a larger dome—an emblem of a greater unity, a greater objective, one that would be powerful enough to draw the two into closer relations and harmony with each other—and to mount this emblem of a great Amendment upon the old base of the Constitution, and, finally, to bring the old structure up to the quality of the new, in appearance at least, he found it expedient to give the old substructure a coat of white paint; but he planned for the reconstruction of its front in the same enduring and beautiful materials of which the wings had been built. He saw weaknesses in the substructure that would not permit him to construct his dome of the same material as the wings, so he built it of cast-iron, and, like the amendment which I feel it represents—that which gave the slaves their freedom and the suffrage at the same time—it overhangs its substructure and is unpleasant to behold from many points of view. But so Walter deemed it expedient to leave it, and so also Lincoln left the Amendment, to succeeding generations to modify or re-construct as may be found necessary or desirable; and how is the present generation doing its duty to that trust? And to whose hands has it been especially committed? When the American Institute of Architects was formed—patterned upon this Royal Institute—Thomas Ustick Walter was selected to be its first President. He was the last representative of American architecture as it was.

The First American R.I.B.A. Royal Medallist.

The architecture of the present in the United States may be said to have begun with Richard Morris Hunt, whom this Institute honoured as the first American to which it awarded, in 1893, the royal gold medal. Hunt, when he returned to the United States in 1855, had been for ten years a student in the Ecole des Beaux Arts in the atelier of Hector Lefuel, and had worked under Lefuel and Visconti upon the construction of the extensions of the Louvre carried out during the Second Empire. He is accredited with the design of the Pavilion which faces the Rue de Rivoli, opposite the Palais Royal. Hunt was the son of a Congressman, and went directly into the office of Walter, working for him upon the Capitol for six months. He then returned to New York, where he found two or three architects endeavouring to resuscitate Gothic architecture by attempting to follow the so-called Gothic revival—or should I say Gothic postmortem?—in England. Upjohn had built Trinity Church with a great steeple, typifying religion dominating over New York—a stone exterior of pleasing design, fit to go with an old English village, and a vaulted interior—that is, "vaulted" in *plaster!* There were one or two other examples of this same sort of thing—a kind of old-world scenery, planted in little parks, amidst Greek temples serving as sub-treasury, hotel, and theatre. He set to work vigorously to change things. He started an atelier, in which he had as pupils Mr. George B. Post and Charles Gambrill, Professor Ware and Henry Van Brunt. All of these pupils turned to the brand-new "Gothic." Ware and Van Brunt practised together in Boston. Gambrill and Post, for a time, in New York. Upon the return to the United States, in 1870, of Henry Hobson Richardson, who had studied for several years in Paris, the firm of Gambrill and Richardson was formed; and in this office the late Stanford White worked as a draughtsman before he, too, went to Paris to study. Hunt had endeavoured to work in the *neo-Grec*, but seems to have found it an up-hill task, and, in spite of his best endeavours and his uncompromising contention against engineers designing architectural work, such buildings as the State War and Navy Department at Washington, the Capitol at Albany, and the Philadelphian city hall, went merrily on. Richardson returned after the war was over, and at the time that the country was being fairly inundated with Irish and Italian labourers, German mechanics, and fortune-seekers and adventurers from all parts of the world, the administrative ability which America inherited from England was taxed to its utmost to preserve order and provide elementary education. Richardson almost immediately caught the rough, vigorous spirit of the times, and his Trinity Church at Boston, Court-house and Gaol at Pittsburgh, and Chamber of Commerce at Cincinnati, attracted the attention of the public to the difference between the work of the architect and that of the engineers and builders. Everybody wanted his building, whether a court-house or church, railway station or gate lodge, in "the Romanesque rock-faced style." An architect's client, who was wealthy but without taste, was described in the architect's office as being "rich and rock-faced." Richardson's work extended all over the country—even to Washington, where he built the residence of the late Secretary of State, then Colonel, John Hay. His design for the Cathedral at Albany was perhaps his greatest work, but the building, a commonplace Gothic structure, was not erected from his design. He died in 1886, and his influence upon the architecture of the country terminated when, in 1888, in the competition for the huge Cathedral of St. John the Divine, a Renaissance design by Messrs. Carrère and Hastings was placed first by the assessor over a number of the most original, impressive, and imaginative works that had been produced in Richardson's style, including the design in course of erection, a huge *tour-de-force* by Mr. William Halsey Wood, and the masterpiece of the period, the design submitted by one Buffington and made by the late Harvey Ellis.

ALASKA-YUKON PACIFIC FAIR, 1909. DETAIL OF THE AGRICULTURAL BUILDING.

Hunt and Avery: McKim, Meade & White.

Hunt, who found his taste for classic work opposed by the wave of Gothic and "Picturesque" popularity, had meantime compromised with the public by taking into association with himself Henry O. Avery, and together they produced the design for the William K. Vanderbilt house, Marquand house, and others in the French transitional styles of Francis I. and Louis XII. The Vanderbilt house was very successful, one of the most charming designs I have seen, either old or modern, in the style. Henry P. Kirby, of New York, produced some fine imaginative studies in this style, which he published in his book of "Compositions." A number of strong men were won over to the style of the early French Renaissance, including Ellis, who produced some interesting work in St. Louis, among other things the City Hall; Bruce Price, of New York, who designed the Chateau Frontenac, an hotel for the Canadian Pacific Railway at Quebec; and Clarence Luce, of New York; Louis Hickman, of Philadelphia; Julius Schweinfurth and George Newton, of Boston, made studies of conspicuous merit, nearly all of which were produced between the years 1888 and 1892. In 1889 several works by Messrs. Carrère and Hastings were published, which had been built at St. Augustine, Florida, in the style of the Spanish Renaissance, but highly original and beautifully adapted to American needs, composed on lines of pure design and ornamented with paintings, mosaics, and decorative sculpture. Messrs. McKim, Meade, and White produced several works in the Italian Renaissance style—the Villard houses and the Century Club; the Madison Square Garden, with the tower similar to the Giralda of Seville, and the New York "Herald" Building, by Stanford White. The publication of the early studies by Mr. McKim for the Boston Public Library, which clearly showed that it owed its inspiration to the Library of St. Genevieve, in Paris, had a very beneficent influence, and for several years was regarded by architects and the public generally as the finest example of architecture in the United States. Its extent and costliness indicated something of the demands for education of the citizens of Boston, and its conservative architecture is unquestionably only a reflection of the character of the representative people of that city.

The Columbian Exhibition

afforded an opportunity, for the first time, of bringing together the combined artistic abilities of several of the then leading architects of the country. Again, the best work owed its inspiration to French designs. From the time of this Exhibition down to the present day the history of the development of American architecture discloses a rapid march of progress. The classic influence, re-established in the public favour by the Exhibition, has been maintained, and has been accepted in one or another of its manifestations throughout the country. Numerous architectural schools have been founded; and the old ones at the Cornell, the University of Illinois, and the Massachusetts Institute of Technology, improved their courses of instruction, modelled in principle upon that of the great school of Paris. The atelier system, first attempted by Richard Hunt, was successfully inaugurated about fifteen years ago (by Mr. E. L. Masqueray, since Chief Architect of the St. Louis Exposition, who was at the time Hunt's chief assistant), and has been fostered by the Society of Beaux-Arts Architects, which has made its principal objective the education of the younger men. The Architectural League of America—a society composed of societies—whose members are the various architectural clubs, which, in several of the large cities do auxiliary work to that of the Society of Beaux-Arts Architects, especially as regards the education of those office-trained men whose circumstances prevent them from taking a regular course in one of the universities. These have given birth to and rock the cradle of the architecture of the future.

After the Exhibition.

It would be an almost Homeric catalogue that would attempt to include the works worthy of honourable mention which have been built since the time of the Columbian Exposition, and I am sure I need only to name a few of the architects who have produced them to recall to your memories views of different works of merit by each of them as among the leaders, Daniel Burnham, Charles F. McKim, George B. Post, John M. Carrère, Walter Cook, Thomas Hastings, Cass Gilbert, Whitney Warren, E. L. Masqueray, Henry Hombostel, Ernest Flagg, Louis H. Sullivan, and Peabody and Stearne, among the strong and brilliant men who have advanced the standard of design, Messrs. Lord and Hewlett, York and Sawyer, Tracy and Swartwont, Hiss and Weekes, Herts and Tallant, Hale and Rogers, Rankin and Kellogg, Trowbridge and Livingstone, Kelsey and Cret, Harold Magnigle, Dome Barber, J. H. Freedlander, H. Blackall, Arnold Brunner, John Galen Howard, J. Randolph Coolidge, Wyatt and Notting, Pell and Corbett, Richard Howland Hunt, Howells and Stokes, Shapley Ruton and Coolidge, Guy Lowell, Parker Thomas and Rice, Cope and Stewardson, Frank Miles Day, Kirby, Petit and Green, and Edgar Seeler.

Gothic Exotic.

Of those who indulge their fancy in Gothic the most successful in obtaining picturesque results (though to me Gothic is an anachronism and an exotic in America) are Messrs. Haight and Githens, Cram, Goodhue and Fergusson, Allen and Collens, Henry Vaughan, Cope and Stewardson, Field and Medary, and, though only occasionally, Julius Schweinfurth, Frederick M. Mann, Albert Kahn, Maginnis, Walsh and Sullivan, and Adin Lacey. Of the younger fraternity whose ability in monumental work has been given opportunities to make itself known are John Russell Pope, Kenneth Murchison, Janssen and Abbott, Delano and Aldrich, Carpenter and Blair, Waid and Parsons, D'Hautville and Cooper, De Galleke and Armstrong, Louis C. Spiering, Mariner and La Beaume, Galvin Keissling, Jackson and Blake, Andrew Sauer, Paul and Seymour Davis, John Van Pelt, W. W. and Hunt Bosworth.

Then there are those who, either by choice or force of circumstances, have devoted themselves to some special class of work, as residences. Of the great number of these architects I will mention only those who have done a considerable amount of excellent work, which enables me to include Wilson Eyre, Charles Platt, Oswald Hering, Lawrence and David Boyd, Little and Browne, Chapman and Frazer, W. G. Rantoul, Claude Bragdon, Alpheus Chittenden, Elmer Grey, Myron Hunt, Frank Lloyd Wright, Hugh Garden, Robert Spencer, John T. Comes, Hoppin, Koen and Huntington, Grosvenor Atterbury, Percy Griffin, James T. Kelley, Newman and Harris, Charles Barton Keen, Meade and Garfield, and George B. Page. The names stand for thousands of well-designed buildings erected during the past decade or two, and there are others.

[Mr. Swales completed his paper with the description of a visit to Washington in the company of friends, to whom the opinions expressed are to be attributed, as they are probably expressed with less reticence than Mr. Swales would himself observe.]

Before Walter died, he made a plan for extending the east front of the Capitol by arranging offices along it, and left it to his heirs to go to Congress for the money when the country couldn't stand the appearance of the old front any longer. Congress has now built for itself two fine office buildings, two white marble edifices with coupled Doric colonnades as we turn west along North B Street. The library has blocked up the view down Pennsylvania Avenue to the south-east, and it occupies but one-half of the last side of the square. At the other side they will probably soon build the Supreme Court Buildings. Several more buildings are needed, and the whole square is to be enclosed by public buildings in the not very distant future. The front of the Capitol is going to be rebuilt in marble, without any "practical" subterfuge, and because at present it is unworthy to be part of a building that stands for the people of the United States. Walter made a plan to improve it, but the addition of offices would have been unfortunate for the effect. Carrère and Hastings have made some changes to his scheme that will make it just as it should be.

We drive now to the House Office building, and inspect the beautiful interiors. The design of these interiors seems to have commenced where the most refined and scholarly work of the best period of the style of Louis Seize left off; we see the rotunda and staircase hall.

The Library of Congress

goes well with the feeling that follows a good meal accompanied by good-fellowship. It was commenced by a couple of Germans, Smithmeyer and Peltz, but finished by three good Americans—General Casey, his son Edward Casey, and Bernard Green. But young Casey was the real architect who made it worth looking at; it was not his fault that the dome on the library, when seen from Pennsylvania Avenue, looks as though it were on one wing of the Capitol. He did well with the interiors; and the plan which is by Smithmeyer and Pelz, is fairly good.

The Mall and the Avenue.

The next thing to see is the Mall. The Avenue, in accordance with the advice of the Senate Commission, is to be cut through the Mall from the middle of the west front of the Capitol straight to the Washington Monument, and beyond it all the way to the river—or almost; that is to say, to a round point near the river where the monument to Lincoln is to be built, and from which the approach to the bridge over to Arlington is to commence. Two of the big buildings are almost built; the pair in South B. Street are only part of the Agricultural Department. They remind us slightly of those in the Place de la Concorde, Paris. The new National Museum, which is not as big nor has it as fine a collection as the British Museum, has not much to learn from it in some other respects.

We have driven past

The Washington Monument,

and when the base proposed by the Senate Commission is added and the trees are planted in a regular way, it will look well, because the small work around the base and the road leading up to it will make it look its 555ft. in height, and it will be more effective and look like a monument.

This building which is going up on the corner to the left is

The New Pan-American Peace Palace

by Kelsey and Cret, of Philadelphia, and just beyond is the club building for the Society which calls itself the Daughters of the American Revolution.

The Corcoran Art Gallery has a fine interior.

The "Limit" of Ugliness.

As we pass between the President's house and the Treasury we ask a friend accompanying us, "Why didn't you drive straight to Pennsylvania Avenue instead of coming round to this side?" "Because," replies the representative from Montana, "that State, War, and Navy building has got on my nerves: for an absolutely ugly building that's the limit!" But this building is about Mullet's worst work.

Besides a number of good commercial and private buildings, there are the Carnegie Library, the War College, by McKim, Meade and White. The Naval Academy at Annapolis is worth the journey. The only cathedral in America that would do for Washington is the new one that Masqueray is building in St. Paul, Minnesota.

"I thought," remarked our English friend, "there was a handsome cathedral being built from designs by Bodley. Do you know about that?" "Do I know about it? That ——" he is about to say something, but cannot, then changes his mind and says softly: "I have seen the design and I suppose it is really a fine thing, though I think Gothic is an anachronism, and in Washington an exotic. A Gothic cathedral in Washington is as bizarre as a forty-storey office building would be in Oxford."

"But what other buildings remain to be built? I should think nearly all have been either completed or commenced," says our guest.

"Well, the Treasury Department is overcrowded, it would be glad to get rid of the office of the Supervising Architect, and the Supervising Architect would probably be glad to be rid of the Treasury Department. There is that Council of Fine Arts recently appointed by President Roosevelt which must be made permanent and given a home somewhere—possibly in that corner opposite the site suggested for the proposed Supreme Court House. It will not be long before the Government will find it expedient to create a separate department to take care of its works—possibly two departments—one a department of Works, and the Fine Arts, which would control everything of an architectural character, controlling the buildings, bridges, parks, and all their details, furnishings, equipment, and decorations, which would relieve the Treasury Department of a heavy load; and another which might be a Department of Engineering Works to relieve the War and Navy departments of a similar strain, by taking over all such works as dams, sea walls, harbours, levees, forts, earthwork and canals. Before long, even with these changes, one of the three departments in the State, War, and Navy building, will have to find new quarters, and even for the two that will be left it will remain inconvenient and unsatisfactory—and that means unprofitable."

"You don't suggest," we exclaim, "that the State, War, and Navy building, will ever be materially altered, do you?"

"We shall see," he replies. "You would have said the same thing about the New York Post Office five years ago, but it has been proved that the country can save money by building a new one. By the way, I haven't answered your question about the Mall—as to whether everybody is agreed—as a matter of fact the Department of Agriculture did try to interfere with the scheme, but Senator Newlands stopped the game by placing a 'rider' on the appropriation, so that the Department could only get the money for the building by setting it up in a given position. But I believe the time will come, and I think within the next four years, when all will be agreed that the plan of the Senate Commission must not be altered—why do I think that? Because nearly every new M.C. is a college man, and nearly every college of importance is planned on a comprehensive scheme. See the new plan for the University of Minnesota, by Gilbert, and those for the Western University of Pennsylvania by Hornbostel; then there are Cornell, Pennsylvania, Columbia, the University of the City of New York, Harvard, Yale, Princetown, Washington in St. Louis, the University of California, to mention only a few which have been, or are in the process of being, built to a prearranged plan. They cannot help but have some influence."

"So you really think my ideal town is a possibility?" asks Mr. Lanchester.

"I am sure it is a possibility," responds O'Grady, "but whether or not it is a probability depends more or less upon your own professional fraternity—you know the sayings as to the enemies of one's own household—and about households divided against themselves. I can remember the days when every architect who came to see me not only

ALASKA-YUKON PACIFIC FAIR, 1909. THE AUDITORIUM. ONE OF THE PERMANENT BUILDINGS.

'knocked' the bad work of the supervising architect under the old *régime*, but also wanted his job. It's different nowadays, they all pull together in public and have their rows out between themselves; of course there are still among them the 'yellow dogs' who bark at everything but their own bone, but those that are any good belong to one or another of the societies—sometimes to several, and they are all pals. They come here organised like an army, there are three or four strong societies, but you cannot put one up against another, for they pull together; and at times—let me give you the tip—we don't know it, but we suspect that they vote together. How do you stand as regards your leaders—or are you the leader yourself—or is your condition as ours was here a few years back, when every man was the sole leader of an army of one? Or, are you in England suffering from the old complaint that used to be the rule here, in the days when the American Institute of Architects had only just come into existence, of not knowing who the leaders of your profession are until they are beyond the age when they desire active leadership?"

"How do you account for this new condition of things among the architects?" asks our guest by way of reply.

"Search me," says the congressman. "How do you account for it?" turning to ourselves.

We reply: To several things; including, first the system of education which enables America to know who their strong men are while they are still young—a system that is competitive and the results of the competitions made public. It is the French system—that of the Ecole des Beaux-Arts—where each student knows exactly the standing and record of every other student as well as his own in every subject. The entrance examinations are to the schools—not to the Institute. Before a student has spent much time or money he knows whether it is likely to be worth his while to do so. Second, to fellowship which arises out of friendly association with one another in the architectural clubs, the universities, and the ateliers in Paris. To the influence upon a large personal following of young men by such strong men as Messrs. Charles McKim, John M. Carrere, George B. Post, Walter Cook, Cass Gilbert, and E. L. Masqueray; and of the college professors, Wm. R. Ware, A. D. F. Hamlin, D. Despradelles, Warren Powers Laird, Frederick M. Mann, Emil Lorch, Paul Cret, and others; but more particularly to the generous impulse of one of the present leaders who had a great opportunity to show his mettle and proved equal to the occasion. This was the man who might have designed in his own offices all of the buildings at the Columbian Exposition, but chose rather to recommend to the Exhibition Company to give out five of the largest buildings to his ablest contemporaries in his own town of Chicago, and five others to men practising in different parts of the country, whose loyalty to these co-workers was never found wanting, and whose integrity and ability—artistic, organising, and executive—proved him to be the fittest to lead, though he conceded himself that leadership to Richard Morris Hunt during his lifetime—Mr. Daniel Hudson Burham, of Chicago, Chairman of the Senate Commission, which recommended to the Senate that the plan of the great L'Enfant should be adhered to.

Discussion.

Mr. John W. Simpson proposed a hearty vote of thanks to Mr. Swales, and said he wished that someone more familiar than he with American architecture had been called upon to perform that duty. Mr. Swales was well qualified to read such a paper, being one of the architects connected with the St. Louis Exhibition, and also an old pupil of Pascal in Paris. It was not his (the speaker's) business to discuss or to criticise the paper. The views Mr. Swales had shown them were quite clearly representative of work in America, and he had nothing to do but to express his appreciation of the general excellence of its character. It was usual, he believed, to draw a moral, and it seemed to him that the only moral to be drawn was the wonderful influence of French work manifested in buildings designed by architects who had received part of their education in France. The great progress made since Hunt came from that country was really remarkable. The Americans were a nation pre-eminently practical; a nation used to dealing with vast monuments not merely as monuments, but as works of actual necessity. He had been occasioned some surprise by the statement of Mr. Swales, that when it was found that the station of the Pennsylvania and the Baltimore and Ohio Railways interfered with the construction of a certain avenue, and the authorities were requested to remove the obstructions, they demurred not at all, but speedily commenced to make the required alteration. He believed that a great improvement would be made if the Charing Cross railway station and the bridge across the foot of Ludgate Hill were demolished, and the respective termini reconstructed on the opposite side of the river to designs by Mr. Ernest George.

Mr. John Slater, in seconding the vote of thanks, observed that it almost turned them green with envy to hear of a young architect going to America and submitting a large scheme, such as the new Admiralty buildings, and getting it accepted immediately. Mr. Ernest George commented upon the common sense of Americans in pulling down certain buildings to make room for others of a more valuable type. He would like to see similar reform instituted in London.

Mr. Swales briefly replied.

TOWN PLANNING AND OPEN SPACES.

The appointment of the first University Professor of Civic Design and Town Planning has naturally invested the subject with fresh and vitalising interest. The somewhat airy abstraction of the publicist and the theorist will now crystallise in the more definite prolusions of the professor. The establishment of the Chair in the University of Liverpool, and the happy choice of an ideal occupant, are of good augury for the movement, and will go very far indeed towards confirming the public confidence in it, and thus towards strengthening the favourable mass of opinion that already seems to give assurance that the Town Planning Bill will not be abandoned, or at least that its best principles will become operative. As to the main motive and purpose of that Bill there is but little opposition; but some of its details are open to strong objection. In particular there is vehement protest against the clauses that give power to local authorities to enclose commons or open spaces, or to appropriate them for building purposes without the sanction of Parliament in each particular case. The Commons and Footpaths Preservation Society, the Metropolitan Public Gardens Association, the National Trust, and the Kyrle Society, are taking united action in preferring the reasonable request that, should it in any case be found desirable to include any public land—park, common, village green, or other similar open space—in a town improvement scheme, under the prospective new Act, an equivalent and a suitable area must be provided in compensation, and that in every such case the express sanction of Parliament must be obtained. No doubt it will be found that open spaces are sometimes awkwardly situated in relation to prospective town planning, so that their obliteration might be necessary to a good scheme; but what is chiefly feared by the jealous lovers of open spaces in that parsimonious local authorities might be tempted by relative cheapness of public as compared with private lands, to prefer to build on the former rather than on the latter. This temptation would be removed if the authority were compelled to make good the public loss. But here the rather nice question arises: How will "an equivalent and a suitable area" be calculated? Any orally worthy town plan, devised upon enlightened lines, will, as a matter of course, include due provision for parks and open spaces; which, however, will be required rather as promenades and playing-fields than as "lungs." The town-planning of the future will include properly organic breathing apparatus, and its parks and open spaces will be beauty spots and recreation grounds.

A CORNER OF THE ALASKA-YUKON PACIFIC FAIR, 1909.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading. Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second, and third respectively. Assessor: Mervyn E. Macartney, F.R.I.B.A., F.S.A.
July 31.	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	BOURNEMOUTH BRANCH PUBLIC LIBRARY. Architects practising in the County Borough of Bournemouth are invited to submit designs for a new Branch Library at Boscombe. Particulars from Charles Riddle, Borough Librarian, Central Library, Bournemouth.
No date.	WALLASEY U. D. COUNCIL. CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

Town Hall Extensions, Stoke-on-Trent.

The Town Council has decided to spend £20,000 on extensions to the present town hall, for the provision of a hall seating 3,500 to 4,000 people, a new courtroom, and other offices. The building committee will request the President of the R.I.B.A. to nominate an assessor to draw up the conditions and adjudicate. Prizes are to be given for the three best designs.

CONSTRUCTION AND WEAR OF ROADS.

At the ordinary meeting of the Institution of Civil Engineers, on Tuesday, March 23rd, a paper on the "Construction and Wear of Roads" was read by Mr. H. A. R. Mallock, F.R.S., who considered the subject from a theoretical point of view with regard to the foundation of the road, its surface, and the character of the traffic. The proper function of the foundation, he said, is to form a buffer between the natural ground and the surface of the road, and within the thickness of the foundation there should be a gradual change in the properties of the material employed from those of the natural ground to that required at the road surface; and, further, the proper thickness to be given to the foundation should depend on the elastic limits and breaking strain of the ground and foundation material. It is suggested that roads with a hollow cross-section, drained by a central gutter covered by a continuous grating, would be worthy of trial, as tending to prevent the accumulation of mud and water close to the footways, and as giving the greatest facilities for keeping the whole of the roadway clean. The formation of dust and mud was imputed almost entirely to the grinding and crushing action of iron tires and iron horseshoes. The diffusion of dust was shown to be chiefly dependant on speed, and on the width of the tires, and in a minor degree on the form and ground clearance of the vehicles. With soft tires the wear of any good road is extremely small, and with pneumatic tires still less, but as long as iron tires and iron-shod horses are used for traction, the best means of preserving a clean and unbroken road surface is to be found either in the applications of tar (many of which have already been made with considerable success), or in some other method which will give the same large limits of elasticity and rupture to the upper layer of road material.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Sewage Purification Works for Small Town

NORTHAMPTON.—X. Y. Z. writes: "Kindly advise with respect to the drainage of a small town as shown in the accompanying plan (not reproduced)."

The scheme suggested consists essentially of a 24-in. diameter sewer, with a free outfall to the river at low water, but which will act as an inverted syphon during the three hours the sewer is tide-locked, when the sewage will rise to a depth of some 6 ft. in a chamber adjoining the river, from which it will throw on to a filter; and after percolating through it will be discharged into a stream adjoining the river, where it will accumulate until the tide has receded sufficiently to allow the stream water to be discharged into the river. During times of storm, when the filter is unable to cope with the full amount of liquid, the surplus will flow across the top of the filter and fall into the stream to accumulate. Hydrostatically there is nothing to prevent this scheme working; but from a sanitary point of view some considerable alterations are necessary, and if the work is to be carried out with the aid of a loan the design of the works must be such as would receive the sanction of the Local Government Board, whose requirements are being modified and brought up to date in accordance with the recent Royal Commission Report. The *normal* volume of sewage during the three hours tide-lock is given as 15,000, but regard must be had to the extreme variations in this quantity which will occur when high water is respectively at about 2 a.m. and 2 p.m. Inasmuch as the storage capacity of the 24-in. pipe is 10,000 gallons, two out of the three hours of tide-lock will be occupied in filling the syphon when there is a flow of 15,000; but when the flow is less than 10,000 gallons in the three hours the syphon will not fill at all, and the filter would be inoperative. There are many sanitary objections to a syphon of this nature, but there is no danger of the pipes lifting. Ballast and coke breeze would be suitable materials for the purification of sewage if arranged in a properly constructed and well aerated filter and the liquid is distributed by a suitable appliance, which conditions the pro-

Mines Building (*Left.*) The Washington State Fisheries Building (*Right.*)

posed filter does not fulfil. The fact of there being no water-closets in the town will not materially reduce the difficulty of purifying the sewage; the presence of spring water in the sewers only dilutes the sewage; it does not reduce the amount of matter to be purified. The overflow of unpurified storm sewage into the stream would cause serious nuisance, and should not be adopted. In order to be able to give details of a suitable scheme it would be necessary to visit the locality and to consider the question as a whole after taking the necessary levels.

HENRY ADAMS.

Rights of Adjoining Owners.

WALES.—P. G. F. writes: "I reside in a house marked B on enclosed plan (not reproduced). In June, 1905, I erected over the backyard of my house a glass roof, and also enclosed the open end with glass, thus forming a dry yard. This structure was erected self-supporting, not in any way fixed to or supported by A's wall. Owing to A's rain-water pipe, I was unable to fix my roof within 3 ins. of A's wall, and I got a lead apron, and laid it against A's wall and on my roof to catch some of the rain-water, and carry it on to roof. I had A's oral permission to do this at the time, but he now asks me to compensate him for the use of his wall as one side of this structure. What I would like to know is, has A any claim on me? And can I compel him to remove his rain-water pipe and shutes, which overhang my property, thus enabling me to place my roof close up to his wall, and so do away with the lead apron?"

If your roof is quite self-supporting, there can be no question but that you were within your legal rights in building it as you did; but, on the other hand you have no right whatever to use A's wall, and must remove the lead apron and everything that is attached to it. I should, however, fancy that a trifling payment of an acknowledgment rental would most comfortably settle the matter. With regard to A's alleged encroachments on your property, if you are quite sure that A's property ends at the face of his wall, you may certainly order the removal of his rain-water spouting—both the gutter part and also the downpipe. In any case, you may most certainly call upon him to rearrange his rain-water spouting in such a way as to cease to discharge his roof water into your property. If you leave it alone for nineteen years and a day, it is probable that A will acquire the right to discharge his water on to your property.

F. S. I.

Water Discoloured with Iron.

CAMBRIDGE.—BATNAC writes: "A new hot-water service consists of new kitchen range with steel boot back boiler, galvanised cylinder in adjoining scullery and galvanised cold supply cistern in room above bath room on first floor connected with Stewarts and Lloyd's' water quality blue-painted flow and return pipes. The supply of water is from a well, and the suction pipe (lead) goes from the pump in the scullery below the kitchen floor to the well about 20ft. away, and 14ft. deep. The pump is of iron, with an iron foot valve at the bottom of the suction pipe. The main trouble is that the water is very much discoloured, as though with rust, and tastes quite strongly of iron, although drawn direct from a tap on the pump. Also pieces of rust-scale up to an inch long come out of the taps over fittings on first floor. After about a month's use the boiler was cleaned out. Enclosed is a sample of what was taken out; it appears to be lime impregnated with rust. I enclose copy of analysis of the water and of the deposit taken from the boiler (not reproduced). Can you account for the discoloration and taste (not noticeable before the installation of new system), and can you advise a remedy or remedies?"

The rust is caused by the iron or steel water pipes between the boiler and the cistern, and the galvanising may have cracked off the hot water cistern by the expansion and contraction night and morning. The first thing to do is to substitute lead or copper pipes between the boiler and the cistern, and also examine the cistern and find out whether the galvanising has cracked off the iron. If the galvanising has cracked off, a new copper cistern is needed, and the inside of the boiler should soon have scaled over with such hard water as yours, and the tainting from that source would then cease; but you will find that boilers of iron or steel plate rust more quickly than those of cast iron. To coat the boiler and pipes with scale, and thus prevent the rust taint, open the hot-water tap a little and keep the water *boiling* for ten hours. If scale can be formed more quickly than rust it will adhere to the iron and steel; but the best remedy in your case is the installation of lead pipes and a copper cistern. If the water was soft, copper would be needed throughout. The iron foot-valve should give place to one of brass or gun metal; or even of wood (elm), with oak-tanned leather hinges or valve; or a perforated cast-iron galvanised strainer-box with a brass valve inside it would prevent rust at the source and hold water in the pump; but you may need a wooden or brass pump to get rid of the rust completely in the cold water.

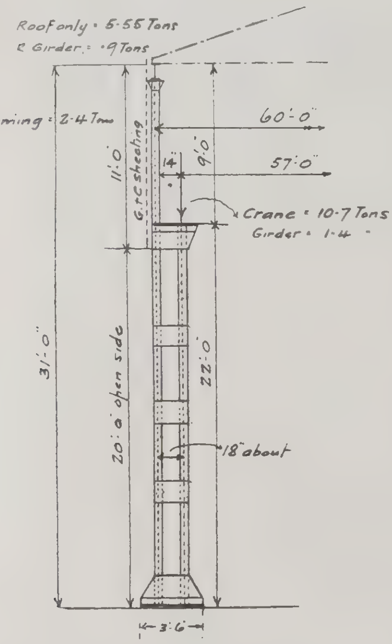
Partnership Question: Style of Firm.

PERTH.—REDSTONE writes: "Alpha and Omega carried on business under that name. Omega retired, and Alpha paid him up his share of the business, but nothing was mentioned at this time about the name. Alpha advertised that the business would still be carried on by him under the same firm name. Alpha died a year after, and left the business to his son, who took two other persons into partnership with him, and they advertised that the business would be carried on under the firm name of Alpha and Omega. After being in business one year, Omega wishes the new partners to sign a letter to the effect that he only allows his name to be used during his or his successor's pleasure. Can Omega call on the partners to sign this letter after the business being advertised in the way aforesaid and him taking no objection? In fact, the firm supplied Omega with goods, and signed the receipts under the firm's name."

I assume, of course, that when selling the business Omega transferred all his interest in the goodwill thereof to Alpha. That gave Alpha and his successors the right to use the name of Alpha and Omega, except in so far as might expose Omega to the risk of being held liable for the firm's debts. If Omega, by taking no step, allows the public to think him still a partner, and to rely on his credit, he might be held responsible. Therefore he is within his rights in objecting to the use of his name to that extent. Alpha may, however, style his business "Alpha, late Alpha and Omega." I do not understand Omega's claim that the permission is only during the pleasure of himself and his successors. His right to object is confined to himself. B.

Columns for Workshops.

There are many points arising in this problem which are difficult of theoretical treatment; the first points to settle are (1) the "fixing" of the columns; (2) what proportion of the wind or other horizontal forces can be considered as distributed to the other side of the building? We will assume that the columns are "free" at top as regards buckling in the plane of the paper, but will assume that only one half of the wind or other horizontal forces are carried by the stanchions on one side of the building. As far as the bending manents due to -the horizontal forces are concerned—and these form the most important factor in the present case—these will be almost the same on our assumption as if we assumed the columns fixed in direction at the top and took all the horizontal forces as being carried on one side, because the bending manents will be less if the ends are fixed in direction.



The horizontal forces are as follows:—

Wind blowing on side of building

$$=\frac{24\times11\times30}{2240}=3{\cdot}54 \text{ tons}$$

Wind blowing on roof

$$=\frac{24\times32.5\times6.7}{2240}=2{\cdot}33 \text{ tons}$$

Dragging force due to crane in

cross travel = say $\frac{1}{10}$ of load = 1 ton.

The bending manent at the base of the column due to these forces are as follows:—

Wind on side $=3.54\times25.5\times12=1082$ in.-tons
Wind on roof $=2.33\times31\times12=866$ in.-tons
Dragging force on crane
$=1\times12\times22=264$ in.-tons

Total $=2212$ in.-tons

∴ B.M. to be carried at the base of each column $=\frac{2212}{2}=1106$ inch tons.

Suppose the column consists of 2 18″×7″ Standard I. beams spaced at 18″ centres. The sectional area will then be $2\times221=44.2$ sq. in. The radius of gyration about a centre line at right angles to the plane of the paper will be $\sqrt{9^2+1{\cdot}45^2}=9{\cdot}12$.

$$\therefore \text{section modulus}=\frac{44.2\times9.12^2}{12.5}$$
$=294$ inch units nearly

$$\therefore \text{stress due to bending}=\frac{\text{bending-manent}}{\text{modulus}}=\frac{1106}{294}$$
$=3.76$ tons per sq. in.

This leaves $6-3.76=2.24$ tons per sq. in. to be provided by direct compression.

Next consider the loads acting on the column.

Load on roof column:—

Roof and roof girder $=5.55+.9$ $=6.45$ tons
Framing $=2.4$ tons

$$\text{Vertical pressure of wind}=\frac{3}{4}\cdot\frac{32.5\times17.4\times24}{2240}$$
$=4.55$ tons
13.4 tons

Load on crane column $=10.7+1.4=12.1$ tons. The total load $=25.5$ tons, and as the two portions are very nearly equal, this may be taken as acting centrally.

The equivalent length of this compound column $=2\times22=44$ feet

$$\therefore \text{Safe load}=\frac{f_c}{1+\frac{1}{6000}\left(\frac{44\times12}{9.12}\right)^2}=\frac{2.24}{1+.75}$$

$$=\frac{2.24}{1.56}=1.43 \text{ tons per sq. in.}$$

$$\text{Direct stress}=\frac{25.5}{44.2}=.57 \text{ tons per sq. in.}$$

This may be taken as satisfactory. We use the method shown above, and not that given for eccentric loading, because the stress due to horizontal loads is a maximum only at the base where the buckling tendency is least, so that this case is not so serious as that of eccentric loading. It should also be noted that we have treated the load given from the crane as the equivalent dead load.

The strength in a direction at right angles to the plane of the paper will be found to be ample.

Next consider the strength of the roof portion of the column above the point where it joins the crane portion.

B.M. due to wind on side $=3.54\times4.5\times12$
$=191$ in.-tons
B.M. due to wind on roof $=2.33\times9\times12$
$=252$ in.-tons

Total $=443$ in.-tons

$$\therefore \text{B.M. on each side}=\frac{443}{2}=221{\cdot}5 \text{ in.-tons}$$

Sections Modulus $=13.3$.

$$\therefore \text{Stress}=\frac{221.5}{13.3}=16{\cdot}7 \text{ tons per sq. in.}$$

This is much too much, and the column must be strengthened. This could be done if it is desirable to keep the clearance as much as possible by riveting a 8in. by 3½in. channel to each flange. The increase in section modulus would be $2\times15.94=31.88$, the total modulus then coming

$$13.3+31.88=45.18$$

$$\therefore \text{Stress}=\frac{221.5}{45.18}=4{\cdot}9 \text{ tons per sq. in.}$$

This leaves 1.1 tons per sq. in. for the direct load consideration; since the direct load is 13.4 tons, and the total area

$22.1+26.6=48.7$ the direct stress

$$=\frac{13.4}{48.7}=.28 \text{ tons}$$

per sq. inch, which will be good enough.

The question of the foundation is more one of fixing securely to overcome the bending manent than of carrying the direct load; for this reason it would probably be more satisfactory to bury the end of the column in concrete. The size of the bolts to tie the column to a concrete base can be found approximately as follows:—Assume column turns about one pair of bolts, the bolts being at 3ft. centres. Then by manents, force on each bolt.

$$\frac{\text{B.M.}}{2\times36}=\frac{1106}{2\times36}=15.3 \text{ tons.}$$

$$\therefore \text{necessary area of each bolt}=\frac{15.3}{7.}$$
$=2.2$ sq. in.

This would be given by 1¾in. bolts. A 1in. base plate will be satisfactory if it is very securely stiffened. A.

Steel Columns and Struts.

In reply to query by Thornton Heath, P.C.E.B., on "Steel Columns and Struts," in present issue of "Builders' Journal," I note value for C is given as follows, viz:—For sections mild steel one I beam $=\frac{1}{300}$.

For sections mild steel two or more I beams $=\frac{1}{480}$.

The $\frac{1}{300}$ agrees with page 344 in Mr. Andrews' book, but for built-up stanchions the value given is $\frac{1}{400}$ not $\frac{1}{480}$. Please say which is correct?"

The value given by me in the "Builders' Journal" of February 17th, for the constant in Gordon's formula for two or more

I a [s vir $c=\frac{1}{480}$

was calculated afresh from a number of cases taken at random, to agree with Rankine's formula as given by me, viz.:—

$$f_p=\frac{6}{1+\frac{1}{6000}\left(\frac{L}{k}\right)^2}$$

Strictly, one should use a different constant for every different section in Gordon's formula, $\frac{1}{480}$ being about the mean of a number of examples that I chose. The value of this constant can be calculated in the following manner:—

Take for example a stanchion composed of two 14in. by 6in. by 57lb. I beams at 8½in. centres and two 16in. by ⅝in. plates. The minimum radius of gyration of this section is 4.50 in., and the value of d in Gordon's formula is 15.25in.

Therefore if c is the constant of Gordon's formula, to agree with Rankine's formula—

$$C\times15.25^2=6000\times4.50^2$$
$$C=\frac{6000\times4.50^2}{15.25^2}=520 \text{ nearly}$$

Next take a section composed of two 10 in. by 3½ in. by 28.21 lb. channels at 4½ in. apart, and four 12 in. by ⅝ in. plates—

k min. $=3\,42$
d $=12$

$$\therefore c=\frac{6000\times3{\cdot}42^2}{12^2}=487 \text{ about.}$$

Take also a section composed of three 16 in. by 6 in. by 62 lb. I beams at 6½ in. centres, and six 20 in. by ⅝ in. plates—

k min. $=5.63$
d $=19.75$

$$\therefore C=\frac{6000\times5.63^2}{19.75^2}=487 \text{ about.}$$

Take finally a section composed of two 12 in. by 6 in. by 54 lb. I beams at 7 in. centres and four 14 in. by ⅝ in. plates—

k min. $=3.90$
d $=14$

$$C=\frac{6000\times3.90^2}{142}=467 \text{ about.}$$

Calculations of this kind show that $\frac{1}{480}$ is a good mean value for stancheons composed of plates and two or more I beams. For sections with channels the value of c may apparently be taken higher still, say $\frac{1}{550}$ as a mean figure. For a lattice channel, for example, of two 10in. by 3½in. by 28.31lb. channels at 6½ in. centres c comes as much as $\frac{1}{660}$. The large variation points to the desirability of using Rankine's formula in preference to Gordon's. A.

Strength of Compound Girder–Correction.

My attention has been drawn to a slip in my reply to "Calculator" in the "Builder's Journal" of February 3rd, which may cause confusion to some readers. The expression for the position of the centroid should be

$$d=\frac{ax}{2A+a} \text{ instead of } d=\frac{ax}{2A}$$

and d should of course be the distance to the centre of the joists, not the plates. This will affect the numerical example given, although the method is otherwise quite correct; d should be 1.4in. nearly, and $Z=95$ nearly, thus making $W=2.25w$ nearly. A.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Wrexham Church House.

NEW CHURCH HOUSE, WREXHAM.

This building is to be erected at the corner of Regent Street, near St. Mark's Church. The design is in late Gothic style, of red brick with stone dressings, and the roof is covered with green slates. The front part is of two stories, and comprises an entrance hall and two committee rooms. A small bar is situated under the stairs for dispensing light refreshments when required, this communicating with the caretaker's kitchen. On the first floor there are a club room and a full-sized billiard room, with raised recess for games. The floors of this part are fireproof construction of reinforced concrete by the Armoured Tubular Flooring Co. The main hall is capable of seating over 400, measures 65ft. by 35ft., and has a raised platform with changing rooms and lavatories at the back. In the basement there are to be a miniature rifle range and rifle room, and a large storage room for chairs. The rifle range is 25yds. long, and will be absolutely safe, as there is a concrete roof. The contractor for the building is Mr. W. E. Samuel, of Market Street, Wrexham, Messrs. Prothero, Phillott and Barnard being the architects.

Our Plate.

We give this week views of the Agricultural Building and the Fine Art Building at the forthcoming Alaska-Yukon Pacific Fair, Seattle, which is to be opened next month. The site is on the grounds of the University of Washington, in the midst of a great fir forest on Puget Sound, and faces three mountain ranges, so that its surroundings are both picturesque and unique. The Forestry Building can claim to be the largest log-house in the world, and there are other buildings for Agriculture, Manufactures, Fisheries, Mines, Fine Art, and Transportation, beside the Auditorium, the United States Government Buildings (including the Alaska, Hawaii, Philippines, and the Government Fisheries Buildings) and those of the foreign countries. The Washington State Building will cost £25,000, and there are also four county buildings. Most of the buildings are of a permanent character, and will remain standing. Views of other buildings are given in the text.

THE SPECIFICATION AND INSPECTION OF TIMBER.

By J. Davies.

Abstract of a paper read before the Society of Architects on March 11th, by Mr. J. Davies, of "The Timber News."

The question is, what forms of timber can the architect specify for use in a given building, which will on the one hand give his client the best value for his money, and will on the other permit the contractor and timber merchant to supply what is wanted without undue inconvenience?

Many of the ports which once sent us large quantities of the fir, pine, or deal, so largely used in building construction, both for joiners' and carpenters' work, have ceased to exist as sources of supply, and conversely other ports, till recently unknown, are now exporting to England some of the best and most suitable shipments.

Out-of-Date Text Books.

Although there is no lack of literature dealing with wood, most of the available books were published many years ago, before the conditions of to-day began to prevail. Some of the students' handbooks deal with the point in an incidental and casual way, and the chapters setting forth the ports of origin are obviously copied from the earlier works referred to. Others are content to generalise, and state that our yellow and white deal come from Russia, Sweden, and Norway; but this leaves us where we were, and does nothing towards helping us to differentiate between the various brands or shipments.

It may be urged that the architect need not interest himself in areas of origin, ports of shipment, or brands, it being his duty to see that good sound timber is supplied, irrespective of any other consideration. This might hold good, if the standard of quality required by different classes of work were always the same, and if builders and contractors were philanthropists eager only to please their clients and to achieve the highest possible level of artistic excellence in their work.

Timber Merchants' Appeal to Architects.

But we have to deal with materials, and men, as we find them, and it has been the custom of the profession to lay down in its specifications certain definitions of what it requires in the way of timber for constructional and decorative work. Now I submit that the timber merchant and contractor are entirely within their rights in asking that the description of timber in architects' specifications shall be clear and definite, and as far as possible in accordance with the reasonable convenience of the trade. So far from deprecating any close and detailed limitations in the timber clauses, the sensible contractor asks for them. Nothing would please him better than to know that the terms used in describing the wood are meant, and will be strictly enforced. Then, to use his own expression, he knows where he is, and can tender accordingly. Estimators now frequently complain that the formulæ usually put before them tell them little or nothing. If they read them literally, they would never secure a contract under open competition. They have to consider the class of erection in question, and the idiosyncrasies and prejudices of the architect, so far as they are known to exist, plus the possibility of trouble from the clerk of works. I attach so much importance to these considerations that, at the risk of labouring the point, I wish to warn the profession that, so far from securing the desired level of quality, the clauses in question frequently open the door to the substitution of inferior materials. If the contractor demonstrates the inability o the timber merchants to supply satisfactory material of the exact description specified, and obtains permission to supply something equal thereto, a great deal is at once left to his own discretion. Further, the more punctilious a builder is, the more will he suffer from the easy morality of his less scrupulous rivals, who by taking the fullest advantages of such opportunities, turn out their woodwork at a lower price and can tender accordingly.

Interpreting Timber Specifications.

In my own experience, I have learnt to associate many of the well-known builders and contractors with a certain set standard so far as their purchases are concerned. It varies with every firm, the experience of no two establishments being exactly alike. There are many who permanently exhibit as intense anxiety to carry out their woodwork in a manner creditable to themselves and just to the architects for whom they work.

Even these are sometimes involved in serious difficulties through varying intepretations of timber specifications, and grave injustice has been inflicted upon them by the inability of architects to realise the difficulties of the situation. On the other hand, there are a few who prefer the existing state of things, and see in it opportunities for using indifferent wood under the excuse that what was specified is unobtainable, and that "this is just as good."

I commend these facts to those who, possibly by reason of their own experience having been free from difficulties of the sort, are inclined to think the present system is sufficient. Of course there are countless instances in which the good faith of the builders and the sound common sense of the architect (best exhibited, when he has a conscientious firm working for him, in leaving as much to them as he can), have surmounted all difficulties without friction. Still, the possibilities of trouble are always there, and the wide differences between sundry clauses taken from recently issued bills of quantities, which I will quote from now, will show clearly that all cannot be right, and some must be wrong. For obvious reasons, I abstain from quoting any clause *in extenso*, but extract the phrases to which exception is taken. The first reads thus:—"The joiners' work to be executed with the best yellow Christiania or best red Petersburg deal"; and the second as follows:—"The joiners' work to be the best Christiania or equal quality deals." But although familiar with importers' stocks and the contents of the dock storage sheds, I should not know where to find a Christiania deal or plank. It may be found right to name a port of shipment, and it may be thought better to omit it; but it cannot be right to name a port which has entirely ceased to exist as a source of supply.

One of these clauses permits the use of Petersburg stuff. This is more reasonable, but is open to the objection that it rules out by implication other ports which send better and milder wood than any we now get from that place. Petersburg wood has shared the deterioration which has characterised the whole of our imports, and even the finest parcels show a considerable proportion of centres, knots, and sap. Another firm specifies the best Gefle yellow deal for joinery. This is nearer the mark, but similarly rules out other equally good Swedish shipments, and the even more useful material which comes from the White Sea, except by the indulgence of the architect.

Another says:—"Joinery to be first quality red Onega, Gefle, or American growth." This gives Onega the preference over other Archangel ports, which now send equally good wood, and rules out Petersburg as well as various Swedish imports. The American growth referred to is doubtless red or yellow pine, which will be dealt with in due course. The next gives Onega, Petersburg, or Archangel, leaving no room for even the best of the Swedish stuff. Altogether, it is clear that the information upon which these clauses have been based is very fragmentary, and is greatly in need of revision. The same applies to the phrases governing the carcassing or carpentry. One says:—"The timber for carpenters' work to be the best Memel, Danzig, or Riga fir, and no American, Swedish or Scots fir is to be used in any part of the building." You will agree that the wording of this clause suggests that the compiler meant what he said. Let us look at it for a moment. Memel has ceased to send us fir. Riga still sends us fir, but not of the former quality. Danzig still sends us fir, in diminished quantities, of smaller sizes and lower quality than in the past. American red pine, which when obtainable is considered equal to any European stuff, is barred. Swedish fir is excluded. This rules out the firm, tough, and elastic wood which comes in abundance from the best Swedish ports, and which is largely used for high-class timbering. What is meant by the exclusion of Scots fir is not clear. If the writer used the term commercially, indicating place of origin, it is necessary, as the quantity of Scots fir or pine used in England or Scotland is negligible, and would not enter into a builder's calculations. If he used the word botanically, to cover a species, he stultifies himself, as the Danzig fir, which he admits, and the Scots fir, which he bars, are one and the same thing. No mention is made of Petersburg wood, which includes some very strong carcassing stuff.

When Tendering becomes a Lottery.

Altogether the terms are very confusing, and make tendering under these clauses very much of a lottery until the personal intentions of the architect are ascertained. Some of the most formidable clauses are the easiest to work under, being recognised as a sort of Thirty-nine Articles, not calling for too literal an interpretation, and never referred to so long as the contractor behaves himself. But there they are, a rod in pickle for him, to be applied at the architect's discretion. Another specification requires as much as possible of the timber to be cut from deals, and not from baulks, with the avowed object of getting it better seasoned. This implies the use of Swedish or Russian stuff.

Summarizing the carcassing clauses, none of them specify the wood mostly used for constructional work where dimensions that are over 12ins. by 4ins. are required, viz., pitch pine, or, in some cases Oregon or British Columbian pine.

Most of our

Schools and Municipal Buildings

are timbered in pitch pine or Oregon pine, so far as the bigger sizes go, and in Russian or Swedish deals and battens where the smaller dimensions are concerned. Yet these items are not specified. Here we have a complete divorce between precept and practice, fraught with possibilities of endless disputes between the profession and the contractors. The right of veto being with the former, the necessity of revision may not appeal to them with such force as to the builders; but the feeling on the part of the latter is very strong, and the expressions which one hears in the ordinary course of business about archaic and obsolete restrictions are more crisp than elegant.

New Formulæ to meet the Case.

It is one thing to condemn, however, and another to create, and it must be admitted that the task of compiling clauses which will govern the use of timber with fairness to all parties is not an easy one. Still, with your indulgence, I propose to attempt it, and will put forward formulæ which appear to me to meet the case. I am not at all dogmatic about their details, and invite the co-operation of my audience in shaping them in such a way as fully to cover the legitimate requirements of the profession, as well as of the timber and building trades. They will be much more authoritative if appearing with the hall-mark of this society. If we can agree upon their terms, I venture to hope that your members will officially adopt them, thereby taking, as a corporate body, an active part in effecting a much-needed reform. Before they are placed before you, it may be appropriate to make a rapid survey of the important features of the timber trade to-day, with special reference to the soft woods which we have been considering, and which form by far the largest proportion of imports. It will be necessary to examine the nomenclature of the staple building wood in some detail, the terms which are variously applied to it being very puzzling to the uninitiated.

Fir that is Pine.

Although we speak of Memel or Danzig fir, the tree which yields it is a pine, botanically known as *Pinus sylvestris*, a coniferous, needle-leaved tree, growing very widely in Russia, Germany, Sweden and Norway, and in some parts of Scotland and the north of England. Whether we receive it in the form of squared hewn logs from Danzig, or planks, deals and boards from Russia, Sweden, and Norway, the wood is essentially the same, variations in its texture and quality being brought about by differences of climate and soil. That is why it is so difficult to draw distinctions between the shipments from various ports, any one shipment containing both fine, slowly grown, and clean wood from the highlands, and coarse, wide-ringed and spongy stuff from the lower and moister ground. A joiner may get hold of a nice clean mild-working deal of a particular brand and swear by it ever after, giving precedence to a shipment the average quality of which may be very ordinary. Or he may come across a piece which is harsh and inclined to warp, or so resinous as to make it impossible for him to get a smooth surface upon it. He is then likely to condemn that mark for good, although its average quality may be very high. Possibly this is one reason why the men who actually work the wood differ so widely in their opinions about it, and make such unreliable guides upon the subject. It is known to the shippers as red, and is so called in the Midlands and North; but most merchants and consumers in the South know it as yellow. It is thus variously called redwood, red deal, yellow deal, Baltic, Memel, or Danzig fir, which are quite enough to go on with; and has even two more names, Northern pine and Scots fir, although these two are fortunately not often met with in the South. It may be noticed here that the word deal is also used to denote a size, as 9 by 3, and in this connection has no relation to the name of the wood itself. It is the wood about which nearly all the disputes occur, and is the one which is usually specified for most forms of building construction, so that we are justified in spending some time upon it. From thirty to fifty years ago it mainly came from Memel and Danzig, Stettin, and Riga, in the form of logs, both round and squared. These were converted into carcassing and joiners' stuff in England, and undoubtedly yielded a large proportion of the finest and most durable wood. But as time went on, Russia and Sweden developed an export trade in what is, as we have explained, botanically the same tree. It came from these places in a more easily merchantable form, viz., sawn square-edged planks, deals, battens, and boards. Naturally, the saving effected in buying the converted sizes had an effect upon the trade in Danzig and Memel stuff, and the imports of the latter fell away, until now we get very little indeed. Still, as it was then correct to specify the latter variety, the terms became very firmly embodied in architects' specifications, and have been copied and re-copied until to-day. The situation is complicated by this fact, that, although Riga fir is no longer of desirable quality, and Memel fir is a thing of the past, we still get these hewn squared logs from Danzig, and if an architect absolutely insists upon it, they can be had, although only in limited quantities, and of very ordinary quality. Consequently, the builder who meets the re-copied clause in a specification is faced by the probability that the architect is only using a figure of speech, but also the possibility that he has some reason for using the words, and actually wants Memel or Danzig fir.

It will next be considered whether there is any special virtue in that wood, as compared with the best Swedish or Russian stuff.

(To be concluded.)

FIRE-RESISTING MILL AT BRIGHOUSE.

The spinning mills of Messrs. Wood Brothers and Sons, Ltd., at Brighouse, Yorks, are being extended. The new building will be 200ft. long, 64ft. wide, and 40ft. high from ground level, and is being constructed over an existing reservoir. There are three floors and roof, and the building is designed to take silk spinning frames, and to be entirely free from vibration. The whole of the structural work is of reinforced concrete with Kahn reinforcement, and the contract has been taken by the Trussed Concrete Steel Co., Ltd., of Westminster and Newcastle-on-Tyne. Messrs. Sharp and Waller, Brighouse, are the architects.

FIRE-RESISTING CONSTRUCTION SECTION.

(MONTHLY.)

CONSTRUCTION OF EARTHQUAKE-PROOF DWELLINGS.

By Caesar Pesenti, Engineer.

Translated from "Il Cemento," of Feb. 15, 1909.

To make a house intended for a locality subject to frequent seismic movements really practical and safe, certain requirements must be fulfilled.

As a result of researches here and in other countries visited by earthquakes, it has been found that the dwellings must not only fulfil all the requirements of modern construction, but must also be able to resist shocks. In this respect the following conditions need to be observed:—

1. The construction of the building should be monolithic, without discontinuation or imperfect joining.
2. The monolith should have great elasticity in every part.
3. It should be as light as possible.
4. The building should be of minimum height, two storeys at most—ground floor and first floor.
5. It must be of comparatively low cost, compatible with the use of the persons for whom it is intended. It must also be hygienic.
6. The building should be able to stand wear and tear of atmospheric influences, etc.
7. It must be able to remain dry, and therefore should be built of non-porous materials. Also it must not harbour the myriads of microbes which are to be found in the wooden houses of earlier date, and of which a distressing example was afforded by the ruined buildings of Reggio and Messina.
8. The building must be fire-resisting.
9. It must keep out both cold and heat.

The writer, from personal experience, adds to the above that buildings can only be rendered absolutely indestructable by earthquake when the following requirements are also fulfilled:—

(a) The building itself must not simply be placed on the ground and fixed to the same by foundations, but must be completely separated from its foundation; in other words, the foundation and the building should form two entirely separate structures, each independent of the other; the building thus being capable of being displaced from the foundation which supports it.

(b) The points of contact between the foundation and the building must be as few and as small as possible.

(c) These points of contact must be perfectly smooth.

(d) The points of contact must be built in such a manner as to prevent conduction of the shock from the foundation to the upper storeys and vice versa, and also be built in such a manner that the shock is lessened and absorbed by the interposition of a material of great elasticity between the points of contact.

We will now carefully consider the above list of requirements and make the necessary deductions.

The requirements Nos. 1 to 9 can be easily met by reinforced concrete, a system of construction which is now generally used and which has been tried on a very large scale. This system, which is already half a century old, is used for the most varied purposes, such as for private and public buildings, which are subject to the most varied loads, for bridges, streets, and railways, aqueducts, reservoirs, etc., etc. We find it used nowadays for all buildings which were previously only possible in iron, wood, and masonry, and also for those which are intended for countries subject to violent shocks. We cannot, therefore, get away from the assertion that the structure either of a public building or of a dwelling house could be most conveniently made in reinforced concrete, which has great elasticity, resists shocks and fire, possesses hygienic qualities, and is capable of keeping out cold and heat, and also of being moved with comparative ease from one place to another. On this point I believe no one could reasonably raise the objection that the fact that some houses built of reinforced concrete were damaged or destroyed in the recent earthquake was sufficient to prove the contrary. It could not be claimed in any way that these houses which were destroyed were built of reinforced concrete, although they were partly built in iron and partly in concrete, brick, and broken stone. Although the different parts were framed together, they were not monolithic constructions, and monolithic character is the first requirement laid down. However, I do not pretend to demonstrate that a building in reinforced concrete, even made according to scientific rules, but with the usual foundations, would have absolutely resisted the shocks and violent seismic movements which took place in Sicily and Calabria. Rather, in fact, I would be the first to admit that these buildings, though they resisted better than the others, would necessarily crack. But I maintain that such damage would not have occurred if the buildings had been monolithic and constructed of reinforced concrete, which were among the first requirements mentioned, and if they also fulfilled all the requirements which I gave under (a), (b), (c), (d).

The accompanying illustrations show a house built with thin double walls, composed of a meshwork of small steel rods which act, so to speak, as tendons of our body or of iron lathing, protected by a layer of cement; in a word, a cage of iron surrounded by a larger iron cage and joined to the first by a thin partition, something like what has been done already in the buildings erected at the factory of Clusone, or like those executed in reinforced concrete with double thin partition walls by the Societa di Navigazione on Lake Iseo for docks, reservoirs, etc.

This building constructed then as a large cage, as above described, with double walls connected by partitions, or bonders, should be divided in half horizontally from another similar cage construction, which serves as a division between the ground floor and the first floor, and be divided by other vertical divisional walls between the different external walls of the house.

The framework—light, elastic, and comparatively indestructible—would have as many points of support as there are angles of the outside walls at ground floor level. The points of support would be covered by an armouring of iron or of galvanised steel, without points and flat underneath.

The armoured feet would rest on a single monolithic platform of reinforced concrete. This ought to be much longer than the perimeter of the house so as to form, under normal conditions, a raised stoep around the house, and should have as many iron or steel plates as there are feet, each solidly connected to the concrete of the platform.

A layer of a different elastic material (for instance, lead or some other metallic composition which is not too hard), should be applied between the columns of the foundations and the platform in order to lessen and absorb the vertical shocks. The platform should be calculated to provide sufficient resistance to sustain the weight of the building when the platform is at its normal level, as when there is any upheaval of the ground the platform is raised at the ends, so that the centre of gravity of the whole system is almost at the point of passing out of boundary of the plan itself, in which case an inclination of the whole building would inevitably result owing to the platform being supported only at the two ends and being free in the middle. The platform of reinforced concrete should therefore rest freely on the ground, well pinned down in such a way that it forms a raised stoep giving access to the building.

Now let us consider how these buildings would act under the influence of earthquakes. An earthquake shock may be undulating or vertical, or both together. In certain places there is also a rotary movement. At Messina a monument was deflected about 90 degrees. If these movements are rythmic and slow the whole building should follow them without injury of any kind. This is so true that in most cases these same even movements do no great damage even to the disjointed constructions of former times. But if instead they are violent and of unexpected frequency, while they undoubtedly cause the destruction of the old buildings, they can never demolish new buildings constructed on the principle suggested above. If the building rests with few points of contact on the large platform and is well placed thereon, no matter how strong and sudden the shocks may be, the platform must follow them in a limited manner, and the building will follow in a still less manner. And this by the law of the inertia of matter. This can be proved by very simple experiments. Let us

Fig. 1.

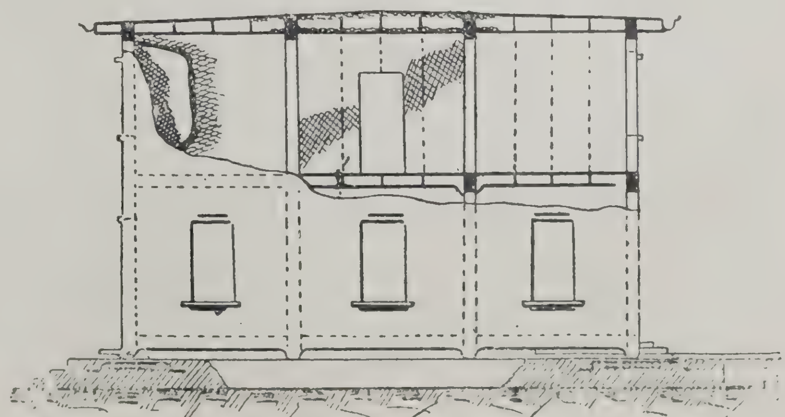

Fig. 2.

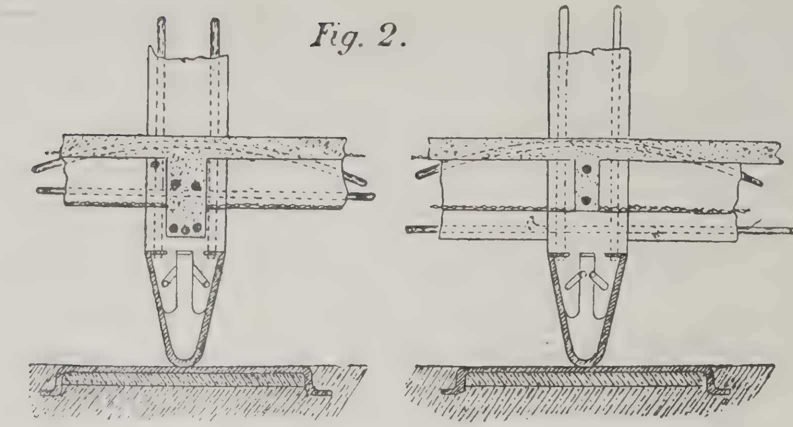

place on a thin lath a second thinner lath, and on the latter put a stool. If we try to move or take away the lower lath by a violent jerk or pull, the upper lath will only partially follow the motion and the stool even less, the latter almost remaining in its original position.

There is a family game which shows the idea still better. Put a playing card on the top of the thumb of the left hand and put a coin on the card. Then strike the card sharply with the middle finger of the right hand, and the card will jump away, the coin remaining on the thumb. The lower lath and the card represent in our case the earth under the influence of a violent seismic movement; the top lath represents the platform supporting the building, the stool and the coin represent the building itself.

I also thought of placing ball-bearings of steel between the foundation columns and the metal plate, but the too easy sliding caused by the interposition of these balls between the foundation and the structure could, it seems to the writer, become dangerous in case of violent oscillations; because, instead of itself moving, the plate under the building would set up a vibration all over the building.

For the vertical shocks which would in certain cases in ordinary buildings be more dangerous than undulating and rotary shocks, buildings built in this manner could not be affected by them, inasmuch as the ground on which the plate rests and the rather thin layer of metal under the foundation column supporting the house should lessen the shocks to a great extent. I can also prove this by a simple experiment.

If a blacksmith's anvil is placed on a soffit, the latter, even though made of reinforced concrete and resisting shocks, will be finally put out of place if repeated blows of a hammer are struck on the anvil; if, on the other hand, we place a slab of wood or a layer of sand or gravel between the soffit and the anvil, the former will not suffer at all under the blows.

At this point it should be noted that my deductions seem to be contrary to the opinions of the celebrated seismologists and geologists P. Cecchi, P. Alfani, B. Bertelli, P. Serpieri, Densa, Mici, Stoppani, and others given in the interesting treatise, "Earthquakes and Houses," of P. Alfani.

The studies and observations of these scientists are, however, based on ordinary constructions, which (differing from those made of reinforced concrete described by me) in order to have a certain amount of stability should have good foundations in the ground, or, better still, in hard and compact rock. For if this is not done it is evident that the least movement of the sub-soil on which the building rests would cause the destruction of the building, which is disjointed and easily put out of shape.

My arguments are, therefore, based on a point of departure diametrically opposite to those of the above-mentioned celebrated seismologists, and it is not to be wondered if the conclusions come to by me are found to be in contradiction to theirs.

To conclude, I am convinced that the first problem of the future regarding new constructions in lands swept by earthquakes should be the profound study, aided with practical experiments, of the programme which I have briefly sketched, consisting above all in a free house on free foundations and in the use of reinforced concrete, with the object of giving to the structure homogeneity, elasticity, lightness, and at the same time to follow the manifold and just requirements of modern construction.

THE CONCRETE INSTITUTE.

The Concrete Institute, which was founded last year, has now attained a membership exceeding 600, of whom the larger number are members of the Institution of Civil Engineers, Royal Engineer officers, architects and surveyors holding public appointments or practising in their private capacity. The Institute has already been incorporated, the incorporation having recently been granted by the authorities concerned.

The governing body is a council of 28 members, among whom are the Earl of Plymouth, C.B., President, Sir Douglas Fox, J.P., Sir Wm. Mather, LL.D., Sir Wm. Preece, K.C.B., Sir Henry Tanner, I.S.O., vice-presidents; Mr. Edwin O. Sachs, F.R.S.Ed., chairman; Mr. E. P. Wells, J.P., hon. treasurer; and Mr. A. E. Collins, M.Inst.C.E., hon. secretary.

Standing committees have been elected to deal with various technical matters, and sub-committees of these standing committees have already been appointed to deal with matters of detail. It may be of interest to note the list of standing committees with the names of their chairmen and hon. secretaries. They comprise the following:—

Science Standing Committee.—Mr. William Dunn, F.R.I.B.A., chairman, and Mr. F. E. Wentworth-Shields, M.Inst.C.E., hon. sec.

Parliamentary Standing Committee.—Mr. A. Ross, M.Inst.C.E., chairman, and Mr. J. Ernest Franck, A.R.I.B.A., hon. secretary.

Reinforced Concrete Practice Standing Committee.—The Chairman of the Executive, chairman pro. tem., and Mr. R. W. Vawdrey, B.A., Assoc.M.Inst.C.E., hon. secretary.

Tests Standing Committee.—Mr. W. T. Hatch, M.Inst.C.E., chairman, and Mr. W. G. Kirkaldy, Assoc.M.Inst.C.E., hon. secretary.

Mass Concrete Standing Committee.—Mr. C H. Colson, M.Inst.C.E., chairman.

The number of general meetings already held is four, and the next meeting will take place at the Royal United Service Institution, on May 27th. The council and committee meetings take place at the offices of the Institute, No. 1, Waterloo Place, Pall Mall, S.W., to which address applications as to particulars should be made.

The Institute is taking up a strong position in the matter of the proposed amendments to the London Building Acts, and has petitioned Parliament on the subject.

The first volume of the transactions has already been issued, and the second volume will be issued this month.

Circular letters with a view to collating information are being prepared on matters affecting the rusting of steel, expansion and contraction, algebraical notation, the specification of dampness in concrete mixtures, etc.

It was originally intended to raise the annual subscription to two guineas per annum for new members at an early stage, but it has now been decided that the annual subscription of one guinea shall stand for new members who join this Institute before October next.

NEW L.C.C. REGULATIONS FOR CINEMATOGRAPHS.

The report of the Theatres and Music Halls Committee of the London County Council states:—

"We have for some time past had under consideration the revision of the regulations respecting the use of cinematograph lanterns, etc., in premises licensed by the Council and in this connection we have had the advantage of having had placed before us the views of the Kinematograph Manufacturers' Association of Great Britain and of the National Association of Cinematograph Operators. We have been able in the amended regulations to incorporate to a great extent the suggestions made by these associations, and we feel that if the Council adopts our proposals the danger attending cinematograph exhibitions will be further minimised without any unnecessary difficulties or restrictions being placed on the manufacturers and operators of the apparatus. The proposed new regulations have also been submitted to the Theatres Alliance and the Entertainments Protection Association, and no alterations have been suggested by these associations. In the statement (No. 1) separately submitted by us on April 6th, 1909, the effect on the existing regulations of the alterations suggested by us is clearly shown."

Statement (No. 1) is as follows:—

Regulations respecting the use of cinematograph apparatus, etc., in theatres and other premises licensed by the Council.

(1) No cinematograph, or other similar apparatus involving the use of a combustible film, shall be exhibited on premises licensed by the Council until the Council has been satisfied that all reasonable precautions have been taken against accident and danger to the public.

(2) Where cinematograph displays do not form a regular feature of the entertainment, notice of any intended exhibition shall be given to the clerk of the Council by the licensee of the premises in which such exhibition is to be given, and such notice shall be given at least three days before the exhibition takes place. Opportunity shall also be afforded to the Council's inspector of inspecting the apparatus at least four hours before the public exhibition takes place, in order to allow time for any necessary alterations to be carried out and approved by the Council's inspector.

(3) In no circumstances shall a cinematograph chamber be placed so as to interfere with the free use of an exit-way, and any temporary alteration in the regular line of a gangway must be amply compensated for by the rearrangement or removal of seats.

(4) Where cinematograph displays form a regular feature of the entertainment the apparatus shall be placed in a permanent enclosure of sufficient dimensions to allow the operator to work freely. Such enclosure shall be constructed of solid incombustible materials not less than 3 inches thick, and be provided with a proper ventilating trunk carried from the highest point of the interior of the enclosure to the outside air. The entrance to the enclosure shall be fitted with a self-closing fire-resisting and smoke-proof door placed at the rear, or on the operating side, of the apparatus and opening outwards.

Where cinematograph displays are occasionally included in the programme the lantern shall, if a permanent enclosure be not available, be contained in a smoke-proof box constructed of sheet iron on substantial frame-work and fastened together securely. The box shall be of sufficient dimensions to allow the operator to work freely, and the floor shall, if boarded, be covered with asbestos or other fire-resisting material. Such enclosure shall, wherever practicable, be ventilated direct to the outside air, and the entrance door thereto shall be self-closing and smoke-proof.

Openings not larger than is necessary for effective projection, and not exceeding in number two for each lantern, shall be permitted in the front face of the enclosure. The openings shall be fitted with a fire-resisting screen or screens, which, on being released from either the inside or the outside of the enclosure, shall close automatically with a smoke-proof joint.

The necessary pipes, electric cables, etc., shall enter the enclosure through properly bushed openings.

(5) The lantern shall be placed on firm supports of fire-resisting construction. The lamp or jet shall stand on an iron tray, with a vertical edge at least 1 inch in depth. The lantern shall be provided with a metal shutter which can be readily inserted between the source of light and the film gate.

The film gate shall be of massive construction, and provided with ample heat radiating surface, and the passage for the film shall be sufficiently narrow to prevent flame travelling upwards or downwards from the light opening.

(6) Where possible the electric arc light shall be adopted as the illuminant, the Council's regulations for securing safety in the electrical installation being observed. Circuits, in which there is a pressure exceeding 250 volts between the poles or from either pole to earth, shall not be allowed in connection with the apparatus. Where the apparatus is used in a portable box a permanently installed circuit shall be carried to a convenient point having regard to the usual position of the apparatus. Resistance shall be fixed in approved positions, and, where practicable, outside the enclosure. A small resistance for regulating purposes will, if desired, be allowed within the enclosure, but such resistance shall be fixed above the level of, and behind, the lantern.

All live terminals and fittings shall, as far as practicable, be protected so as to minimise the risk of short circuit or shock. Suitable fuses shall be provided at each pole for the main circuit, and for each of the sub-circuits, *e.g.*, the sub-circuits for pilot lights.

If limelight be used in the lantern the general regulations for its safety, which are issued by the Council, shall be complied with, special attention being given to the tubing, which shall be of sufficient strength to resist pressure from without, and shall be properly connected up. Ether and other inflammable liquids shall not be employed under any circumstances for producing light.

(7) All cinematograph projectors shall be fitted with two metal film boxes of substantial construction, and not more than 12 inches in diameter, inside measurement, to and from which the film shall travel. Such boxes shall be made to close in a manner which will prevent the ingress of fire, and shall be fitted with a film slot capable of preventing the passage of flame to the interior of the film box. Gearing should be used in preference to flexible belts for driving the "take up" spool.

All films when not in the machine, and while still in the operating enclosure, shall be contained in such closed metal boxes.

(8) (*a*) Smoking within the enclosure shall be forbidden at all times.
(*b*) Storage of any description shall not be permitted within the enclosure.
(*c*) Adequate small fire appliances, including a bucket of sand, shall be kept available outside the enclosure, and be in the charge of a special attendant.
(*d*) The general lighting of the hall and exits shall not be controlled solely from within the operating enclosure.
(*e*) A suitable barrier shall be placed round the temporary box to prevent the audience coming into contact therewith.

(9) The licensee shall be held responsible for seeing that the Council's regulations are complied with in every respect, and for the employment of competent, experienced, and trustworthy operators, and shall be prepared at any time to supply to the Council satisfactory credentials in this respect.

(10) The Council reserves to itself the right of requiring the adoption of any further precautions, in addition to those specified above, as circumstances may require.

STEEL FRAME BUILDING ENCASED IN CONCRETE.

Cleveland, O.—What is claimed to be a distinctly improved type of reinforced concrete construction is being used in the erection of the new 500,000 dollar Sterling Welch store building at Cleveland. The building is 84ft. by 500ft., with a wing 115ft. deep. It is five stories high, with a basement.

The reinforced steel frame of the building was designed by the Osborn Engineering Co., consulting engineers for the architects, Messrs. Milton Dyer and F. G. Bates. The building is roofed now, and remarkable progress has been made on account of the peculiar form of frame construction.

This is a combination of structural steel and reinforced concrete. It differs from the usual type of structural steel in that the steel frame is very light, and is designed to carry only a part of the load, while the fireproofing protection of concrete is made to carry its share all loads. It also differs in that the structural steel is first erected, and acts as a support for the concrete forms. It has all

EXTENSIONS AT HELES SCHOOLS, EXETER. WARE AND SONS, ARCHITECTS.

Expanded steel concrete flooring and steelwork encasing throughout.

the merits, it is claimed, of both steel construction and reinforced concrete construction, without the defects of either. Although it costs more than the usual form of work, the speed with which the work can proceed is much in its favour. The system has been used in one form or another in some eastern cities. The columns are made of eight light angles running continuously from the foundation to the roof. The floor girders and beams are made of light angles placed at the bottom and top of the girders and laced together by bars. These columns and girders are encased in concrete, the floor slab of reinforced concrete being laid at the same time as the concrete for the columns and girders is poured.

The angles and lacing of columns and girders permit the concrete to become thoroughly attached to the steel work. The steel is set exactly where it should go, and on account of each section of column and each section of girder being assembled at the bridge shop, the steel must come at the exact and proper place in the encased concrete, a somewhat difficult thing to accomplish always in the ordinary way of pouring concrete and inserting reinforcing rods. The girders and beams are riveted to the columns, making the connections absolutely rigid.

One great benefit claimed for this system is the speed with which construction work can proceed. The steel frame can be erected and concrete poured on all floors at once if desired.

THE CORROSION OF STEEL REINFORCEMENT IN CONCRETE.

By Ernest R. Matthews, A.M.Inst.C.E., F.R.S.E.

Abstract of a paper read on April 5th at a meeting of the Society of Engineers, at the Royal United Service Institute.

An Erroneous Impression.

It has been said that reinforced concrete should be avoided, as it is a treacherous material to use, owing to the fact that the metal corrodes, and being covered by the concrete the extent of the corrosion can never be ascertained, and therefore many well-known engineers up to the present have avoided the use of the material owing to this impression. If they were right in their assumption, and the steel did corrode, and there was no remedy for it, then reinforced concrete would soon have had its day, for its weakness in this respect would become generally known, and it would naturally be avoided; but, from a series of experiments which the author has recently made, and which he describes in this paper, he is in a position to state definitely that no such fears need be entertained. Before describing his own experiments, he would in a few words set forth the gist of the information which we already have in relation to this important matter. In America the subject has received a good deal of consideration, and the commonly accepted theory in the United States respecting corrosion of iron in concrete is that stated by Professor S. B. Newbury, which is as follows:—

How Rust is Formed, and Why Concrete Prevents It.

"The rusting of iron consists in oxidation of the metal to the condition of hydrated oxide. It does not take place at ordinary temperatures in dry air, or in moist air free from carbonic oxide. The combined action of moisture and carbonic acid is necessary. Ferrous carbonate is first formed; this is at once oxidised to ferric oxide, and the liberated carbon dioxide acts on a fresh portion of metal. Once started, the corrosion proceeds rapidly, perhaps on account of galvanic action between the oxide and the metal. Water holding carbonic acid in solution, if free from oxygen, soon acts as an acid, and rapidly attacks iron. In limewater or soda solution the metal remains bright. The action of cement in preventing rust is now apparent. Portland cement contains about 63 per cent. lime. By the action of water it is converted into a crystalline mass of hydrated calcium silicate and calcium hydrate. In hardening it rapidly absorbs carbonic acid, and becomes coated on the surface with a film of carbonate, cement mortar thus acting as an efficient protector of iron and preventing the carbonic acid molecules from attacking the metal. The action is, therefore, not due to the exclusion of the air; and even though the concrete be porous, and not in contact with the metal at all points, it will still filter out and neutralise the acid, and prevent its corrosive effect."

Some Very Important Tests

have been carried out by Professor C. L. Norton, of the Massachusetts Institute of Technology, Boston. These were conducted on the following lines. The blocks were made of:—(*a*) Neat Portland cement; (*b*) 1 part cement and 3 parts sand; (*c*) 1 part cement and 5 parts broken stone; (*d*) 1 part cement and 7 parts well washed cinders. The reinforcement of each block consisted of a ¼in. rod, a piece of soft steel, 6in. by 1in. by 1-16in., and a 6in. by 1in. piece of expanded metal. The tests were as follows: One-fourth of the blocks were allowed to remain in air inside a building. One-fourth were placed in a sealed box in an atmosphere of air and steam. One-fourth in a sealed box in an atmosphere of air and carbon dioxide. One-fourth in a sealed box containing an atmosphere of steam, air, and carbon dioxide. Some of the reinforcement was dipped in cement grout previous to insertion in the concrete, but in other cases it was not.

The results of these experiments led Prof. Norton to the following conclusions:—(1) That neat Portland cement, even in thin layers, is an effective preventative of rusting. (2) Concrete, to be effective in preventing rusting, must be dense and without voids and cracks. It should be mixed quite wet, when applied to the metal. (3) The corrosion found in cinder concrete is mainly due to the iron oxide, or rust, in the cinders and not in the sulphur. (4) Cinder concrete, if free from voids and well rammed when wet, is about as effective as stone concrete in protecting steel. (5) It is of the utmost importance that the steel be clean when bedded in concrete. Scraping, pickling, a sand-blast, and lime should be used, if necessary, to have the metal clean when built into the wall. These tests extended over a period only of three weeks, which, in the author's opinion, was not long enough. For years past French engineers have protected many of their iron bridges by coating them with cement wash, two coats being usually applied, and in America cement wash has been largely used for a similar purpose. M. Breuille, of France, states that from his experiments he came to the conclusion that in all cases the action of the cement in the concrete on the iron reinforcement prevented rust, and that it even removed the rust from iron which was already rusty when embedded in the concrete.

The question of

The Rusting of Steel in Concrete

has received the attention of German engineers, and numerous tests have been made, the general conclusion arrived at being that cracks occurring in the concrete do not result in the reinforcement becoming corroded at these points. The method of testing was briefly as follows:—Beams were prepared which were reinforced by the steel which is generally used in reinforced concrete structures, this steel being placed 1¼in. above the bottom of the beams. The concrete was mixed in the following proportions:—1:2:4, 10.1 per cent. of water being added. The forms were removed after a set of 24 hours; the beams were then stored for three months, some in wet sand, others in the open air, water being poured over them daily. For the next three months the beams were subjected to load tests, and of 58 beams made 26 were broken under these tests. The 32 beams which had not been broken were then subjected to a rusting test under a load, sheet iron casing being fixed around the middle third of the beam, through which a mixture of carbon dioxide, oxygen and water vapour passed. The beams were kept in this rusting atmosphere for three days from 7 a.m. to 4 p.m. The steel was then examined with the following result:—

In 27 out of the 32 cases no rusting had occurred. These 27 beams had been subjected to a load causing stresses of 18,000lb. to 35,000lb. per square inch in the steel, and the five remaining beams had been subjected to a greater stress, viz., 35,000lb. to 44,000lb. per square inch.

Mr. J. M. Braxton, assistant engineer at Key West, Florida, U.S.A., recently reported to the engineer officer in charge of the fortification works on the East Coast of Florida that he had made 15 sets of two blocks each, the aggregate in five of these sets consisting of three parts of coral sand, common to the beaches of the Florida Coast, and five parts of bricks crushed to pass through a 1in. ring: in five others it consisted of three parts of coral sand to five parts of brick crushed to pass through a 2in. ring, and in the remaining five blocks it consisted of three parts of silica sand and five parts of brick crushed to pass through a 1in. ring. The blocks were 12in. by 12in. by 6in. The reinforcement, which in each case was inserted in the middle of the blocks, consisted of twisted steel rods 8in. long and ⅝in. diameter. Some of the rods were dipped in grout, and others were not treated in any way. Half of these blocks were placed in the ocean after a 24 hours' set, and half were exposed to the air. At the expiration of a period of one year and 21 days, these blocks were broken, and it is interesting to note that the rods in those blocks which had remained in the sea water showed no signs of rusting, but those which had remained in air showed very slight rusting, regardless of the aggregate of which the blocks were made.

Some London Experiments.

Some interesting tests were carried out a short time ago at the National Physical Laboratory, London, at the request of Sir John Brunner, and the following is the official report of these experiments:—"A strong wooden box was made and divided into five partitions, each partition being 12in. long, 7½in. wide, and 7½in. deep. Specimens of mild steel of the following dimensions were prepared: (1) One inch diameter, 8in. long, turned all over. (2) Eight-inch lengths cut from 1½in. by 1½in. bar with the scale left on. The partitions were half-filled with good Portland cement concrete, and a specimen of each kind of steel laid on the top, the partitions being then completely filled with concrete. This was done on December 21st, 1906. The blocks were covered with water several times per week for a year, and for three months afterwards they were left in the open exposed to the weather. On April 20th one of the blocks was removed from the box and broken up, and the specimens removed. On examining the specimens carefully no trace of any action by the cement could be detected. The turned specimen was practically as bright as when it was put in, and the scale on the rough specimen was undisturbed. To test the possibility of any slight action, the surface of the turned specimen was polished and etched and examined under the microscope side by side with a specimen of the same material cut from the centre of the bar. No difference in the microstructure of the two specimens could be detected, and the conclusion is that in 16 months no action has taken place between the metal and the concrete."

While the preceding information is undoubtedly valuable, it will be readily seen that the results of the investigations vary considerably.

Influence of Aggregate, Water, and Air.

Prof. C. L. Norton found that corrosion took place when cinders were used as the aggregate of the blocks made by him; he also informs us that to dip the metal in cement grout was a sure proof against corrosion, but the metal must be clean before being dipped. This opinion is practically the same as that expressed by Prof. S. B. Newbury. M. Breuille, of France, found that no corrosion took place when steel was inserted in concrete, but that the reverse occurred. He put rusty bars into concrete blocks, and when these blocks were broken some time after, the bars were found to be quite bright. Mr. J. M. Braxton, on the other hand, found that slight rusting occurred when the blocks were placed in air, and that when submerged in sea water no corrosion of the metal occurred, while Sir John Brunner's tests indicate that no corrosion takes place when the blocks are placed in water and air alternately. In the German tests no corrosion occurred when reinforced beams were placed in air and others in wet sand, and afterwards subjected to a test load applied to produce a stress in the steel which did not exceed its elastic limit.

The R.I.B.A. Conclusions.

The report of the special Committee appointed by the Royal Institute of British Architects respecting this important matter should here be quoted. Their report, after dealing with other characteristics of reinforced concrete, goes on to say:—"It is sometimes thought that the metal may perish, but all experience shows that concrete is the best preservative for iron or steel known to us. A bar of iron or steel, slightly rusty, embedded in properly made concrete, may be taken out after some months, or after hundreds of years, brighter than when it was put in. Perhaps I may quote an instance (says Mr. W. J. Locke, then Secretary R.I.B.A.); the experience of Mr. Somers Clarke, formerly Surveyor to St. Paul's Cathedral, who, being anxious as to the condition of the great chain tie which binds the dome at its base, caused an opening to be made in the concrete in which it has been embedded for over two hundred years, and found the iron bright and perfect, notwithstanding the fears which had naturally been felt because of the percolation of water from the gallery over it. This is but one of many examples, showing not only that metal reinforcements and concrete have been used by architects for many years back, but that their confidence in the durability of concrete and metal in combination is justified.

The many instances of

Anchor Chains of Suspension Bridges

being embedded in concrete as a provision against their deterioration through the action of moisture may also be cited as showing the reliance placed on concrete by engineers for the protection of steel from corrosion."

The author, about 2½ years ago, had occasion to pull down part of a concrete sea wall at Bridlington which had been built 25 years previously, and he found that the iron chains which had been inserted in this wall at the time of its construction were still in a perfect condition; there being no sign of rust in spite of the fact that the sea covered the lower portion of the wall at every tide, and that in some places the chains were within an inch of the outside face of the wall.

The Author's Experiments.

The author then described the experiments recently made by him. He set himself the task of discovering something definite on 14 points, which are as follows:—(1) The effect upon the steel reinforcement of submerging blocks in 3ft. of fresh water, seven days after making them, and keeping the blocks in water for eleven weeks. (Steel untreated.) (2) The effect upon the steel of submerging blocks in 3ft. of fresh water after a 48 hours' set, and keeping the blocks in water for 11 weeks and 5 days. (Steel untreated.) (3) The effect upon the steel when the blocks are kept exposed to the air for 12 weeks. (Steel untreated.) (4) As No. 1, but when the steel is first dipped in cement grout. (5) As No. 2, but when the steel is first dipped in cement grout. (6) As No. 1, but when the steel is first dipped in linseed oil. (7) As No. 2, but when the steel is first dipped in linseed oil. (8) As No. 1, but when the steel is first dipped in turps. (9) As No. 2, but when the steel is first dipped in turps. (10) The effect upon the steel of keeping blocks, after a seven days' set, in water and air for alternate weeks for 11 weeks. (Steel untreated.) (11) The effect upon the steel of keeping blocks in water and air for alternate weeks for 11 weeks and 5 days after a 48 hours' set. (12) The effect upon rusty steel when the blocks are submerged in water for 11 weeks after a seven days' set. (13) The effect upon rusty steel when the block is submerged in water for 11 weeks and 5 days after a 48 hours' set. (14) As No. 13, but exposed to the air for 12 weeks.

The author had 20 concrete blocks made, formed of various aggregates, each being 8in. cube. In some instances the aggregate consisted of:—4 parts broken bricks, 2 parts sand, 1 part Portland cement. In other instances the proportions were:—3 parts ¾in. gauge slag, 1 part ⅛in. and dust slag, 1 part sand, 1 part Portland cement; also:—2 parts ¾in. gauge slag, 1 part ⅛in. and dust slag, 1 part coke breeze, 1 part Portland cement; also:—2 parts broken stone, 2 parts ¾in. slag, 1 part sand, 1 part Portland cement; also:—3 parts slag, 2 parts sand, 1 part Portland cement.

The analysis of the cement used was as given below:—

CHEMICAL ANALYSIS.

	Per cent.
Insoluble residue	0.82
Silica	20.43
Alumina	9.10
Oxide of iron	1.95
Lime	62.65
Magnesia	1.25
Sulphuric anhydride	1.38
Loss on ignition	1.66
Alkalies and loss	0.76
	100.00

The metal inserted also varied; in some cases it was put in in a rusty condition, in other cases it was clean. Some pieces of steel were dipped in cement grout, others in linseed oil, and others in turps.

The Author's Conclusions.

No absolutely bright steel was used by the author in these experiments, and the concrete used in these blocks was in no way specially prepared; in fact, in some cases it was rather carelessly done, with a purpose, namely, to make the test more severe. The results of his experiments have led the author to the following conclusions:—(1) That rusty steel embedded in concrete will in a very short time become bright, regardless of whether the concrete is in water or air. This point has, in the author's opinion, been conclusively proved by his experiments. (2) That the application of cement grout to steel is an effectual safeguard against corrosion, but that the greatest care should be taken in the grouting process to see that every portion of the steel is well coated, and that before the steel is embedded in the concrete the cement grout is allowed to become quite dry upon the steel. (3) That if the aggregate used for the concrete is not porous and the concrete is well mixed, the reinforcement being well embedded, no cement coating is needed. (Seeing that the application of a coat of cement grout is such an inexpensive procedure, the author makes it a rule in carrying out work of this kind to have all reinforcement coated in this manner.) (4) That no porous materials, such as coke breeze or slag, should be used in connection with reinforced concrete work, if such concrete is intended to be under water or exposed to the air. (5) That linseed oil or turps, or probably any other coating except cement or lime, applied to steel before its insertion in concrete facilitates rather than prevents the rusting of the metal. (6) That it is of great importance to see that the reinforcing steel is well embedded in the concrete, so that every portion of it is covered with cement. (7) That the best results were obtained when the aggregate consisted chiefly of broken stone or brick bats. Gravel would no doubt answer as well. The author was surprised that such a good result was obtained with an aggregate composed of brick bats. (8) That river sand, generally speaking, is not satisfactory for reinforced concrete work, where such work is required to be water-tight.

The author ventures to think that the conclusions which he has arrived at are of great importance, and should ease the minds of those engineers who up to the present time have had considerable doubt regarding this matter; he also hopes that the attention of the Local Government Board will be drawn to these experiments, and the conclusions arrived at, and that this will result in the period for repayment of loans for work of this class being considerably extended.

BLACKLER'S STORES, LIVERPOOL.

This is one of the largest stores in Liverpool, comprising over 11,000 square yards of reinforced concrete flooring. Indented steel bars were used throughout, of 1/3in. and ½in. diameter. The ground floor carries a load of 2cwt. per square foot, and consists of a 5in. slab, reinforced with ½in. bars spaced in accordance with the length of

BLACKLER'S STORES, LIVERPOOL: W. AUBREY THOMAS, ARCHITECT.

span. The average span is 9ft. On the first floor there is a projection of some 3ft.—built entirely in reinforced concrete—carrying the heavy cornice of the building. It should be interesting to note that, although at one time the floors were overloaded in many parts, no sign of deflection or any weakness was to be found. The structure was erected complete in record time—about ten weeks. The architect for the work was Mr. W. Aubrey Thomas, of Liverpool, and the contractors were Messrs. Henry Johnson and Sons, also of Liverpool.

THE LONDON COUNTY COUNCIL.

Loans.

The London County Council, at their meeting on Tuesday, April 6th, approved loans to the following:—

Islington Guardians: £2,075, for land and purposes to be appropriated as a home for children.

Stepney Borough Council: £1,500, for electric lighting, house services.

Tenders.

The following tenders were recommended for acceptance by the General Purposes Committee:—

J. Mowlem and Co., Ltd., for engineering jobbing works, for a period of three years.

Kemp, Durrant and Co., for the execution of hoarding, shoring, and other works in connection with property on improvement and other schemes, for a period of three years.

The following tenders were recommended for acceptance by the Education Committee:—

Galbraith Brothers, Ltd., 46, Camberwell Green, £10,117 6s., for the erection, on the Hitherfield Road site, Wandsworth, of a school for 370 children.

F. and T. Thorne, Isle of Dogs, £1,936, for the enlargement of the playground of the British Street School, Poplar, and the erection of a house for the schoolkeeper.

E. Lawrance and Sons, Wharf Road, City Road, £1,563, for the erection of a manual training centre, for 40 boys, at the Woolmore Street School, Poplar.

The following tenders were recommended for acceptance by the Highways Committee:—

Thomas and Edge, Woolwich, S.E., £3,326, for the construction of a new embankment wall at the river frontage of the Tramways permanent-way depot, Greenwich Road, Deptford.

S. W. Francis and Co., Gray's Inn Road (second lowest), for four steel rolling shutters for the paint shop at the Holloway Car Shed.

The New County Hall.

The London County Council agenda for April 6th Establishment Committee's report states that, "in the process of working on the drawings the selected architect, Mr. Ralph Knott, has come to the conclusion that he can greatly improve the appearance of the centre portion of the river-front by a modification of the approved design. We have had the advantage of hearing the opinion of the assessors in the competition, who have most generously advised us in the matter. There are one or two criticisms on which they lay stress, which we have reserved for further consideration at a later stage. These opinions do not, in our opinion, seriously affect the main lines of the composition, and in all other respects, Mr. Knott's design as now submitted has the general approval of the assessors. As a result, we have no hesitation in asking the Council to agree to the proposed modification. We have caused both designs to be placed on view in the members' lobby."

The Establishment Committee recommend for acceptance the tender of F. and H. F. Higgs, of Station Works, Loughborough Junction, S.E., £46,900, for the construction of the raft foundation and retaining walls in connection with the new County Hall.

New Buildings.

The Building Act Committee of the London County Council has given consent for the following buildings:—

Clapham.—Nurses' home for the Wandsworth Union Infirmary, on the application of Mr. J. S. Gibson.

Whitechapel.—Buildings on the eastern side of Hope Street, on the application of Mr. A. Davis, on behalf of the Osborn Estate and Mrs. H. Davis.

Strand.—Erection of a building on the south-western side of Catherine Street, to abut also upon the northern side of Exeter Street, on the application of Mr. G. H. Fox, on behalf of Mr. T. Pocklington.

Bow and Bromley.—Two buildings on the northern side of Blondin Street, Old Ford, on the application of Mr. F. R. Hasluck, on behalf of Mr. J. Pedley.

Marylebone, East.—Erection of two cooling towers at the Grove Road generating station, on the application of Messrs. Kennedy and Jenkin, on behalf of the Central Electric Supply Co., Ltd.

Bermondsey.—Additional premises for E. Lazenby and Son, Ltd., Crimscott Street, on the application of Mr. W. Downs, on behalf of Messrs. E. Lazenby and Son, Ltd.

Chelsea.—Ice factory at Kensal Wharf, Harrow Road, on the application of Mr. H. P. Drew, on behalf of Carlo Gatti, Stevenson and Slaters, Ltd.

Greenwich.—Addition to the premises, Blackwall Lane, of the applicants, The Delta Metal Co.

A CONCRETE TOWN.

The new town of Concrete, near Washington, claims to be the first wholly fireproof town in the world. Lots are sold with the proviso that the buildings thereon must be of concrete.

HARD WOODS AND FIRE RESISTANCE.

(Concluded from p. 151, No. 732.)

Tests Series "C."

The stair-treads of both woods mentioned at the commencement served for this series of tests. Whilst the series of tests "A" serve, to a certain extent, as preliminary experiments, and it was endeavoured to ascertain in tests "B" the greater or smaller inflammability of both kinds of wood, the series of tests "C" were intended to answer the following question:—Which of the two woods would, in the case of a continuous fire, prove of use for the longest time, when constructed as staircases—that is to say, which would possess the greater carrying power if extreme heat were applied to the same for any length of time?

In order to conform as nearly as possible to every-day practice, it would, of course, have been best to have had a staircase in extenso; but it was impossible to make arrangements for this, excepting with great difficulty. Even the tests undertaken with stair-treads 10 cm. wide demanded so great a time that they could not have been carried out on a much larger scale. Therefore, the pieces of wood still available from the lengths already used were trimmed up and planed, whereby the following dimensions were obtained:—1.0 m., 0.48 m., and 0.04 m.

The number of tests which were thus doubled afforded a greater safety against accidents. Each pair of stair-treads of the two kinds of wood were stood up horizontally against a firm brick wall, with its ends of 12 cm. length, so that the breadth of the span between the pair was 76 cm. Thereupon one of the two burners already mentioned in the series of tests "A" was applied underneath the wood (these burners had been so arranged as to give off equal heating power for a given height); and it was then so fixed with solder and rod, that it came exactly in the middle of the wood, and the under surface of the wood was set to the height over the burner for which the two burners had been regulated.

A suitable structure of brick was then fixed to both sides of each burner at a suitable distance, and extending well over the burners, so that if at a later time the wood collapsed, this structure could receive the weight of the wood, and so protect the burners, which were necessary for the continuation of the tests. Furthermore, in order to guard against any inequality in the heating power of the two burners, they were changed about (as was the case in the series of tests "A") in such a manner that the burner used for the oak in one case was used for the beech the next time, etc., etc.

At the commencement of each experiment, both burners, which, as indicated, were fixed one under the oak, the other under the beech, were lighted at the same time, and the time noted. It was then noticed how long a time elapsed before the woods showed any weakness in their carrying capacities when under the influence of the fire, and of a certain load being applied, the load in both cases being equal. "The load" took the form of a bundle of bricks fastened together with wire, to which had been attached a handle, the weight being 11.6 kg. At the first of these tests with the 10 cm. wide stair-treads (not shown in the table), the heating and burning took place with the load on. The same was left on the woods until the moment of breaking.

In the case of the remaining tests (and in order to protect the burners), the heating up was always done without the weight being on; and then, from time to time (the intervals being shorter and shorter, at last being only minute intervals), the load was laid on until the breaking point was reached.

The tests are shown in Table IV. The oak broke earlier than the beech five times out of twenty cases; in three cases they broke at exactly the same time, and in twelve cases the oak broke later. On the whole, the durability of the oak was greater than that of the beech.

The charring extended further in the case of the beech than in that of the oak, as was also shown in the series of tests "A."

It would not be right, in the case of the material here experimented upon, to take it that, generally speaking, the oak possesses greater carrying powers. The time at which the oak broke varied very much, viz., from 17 to 43 minutes, showing a difference of 26 minutes, whilst in the case of the beech the limits were from 21 to 30 minutes, showing a difference of only 9 minutes (Table IV. "B"); and it is here that, in our opinion, the difficulty of these tests arises. In order to arrive at a more correct opinion, it is necessary to study more closely the quality of the woods used.

TABLE IV.

No.	Wood used.	Year rings. MM.	Specific weight.	Quality of Wood.	Breaking point. Beech-Oak Minutes.	Partial charring Beech-Oak MM.	Uncharred remained Beech-Oak MM.
1	Oak	1.4	—	Oak, narrow-ringed, bu rich in substances	41	126	15
	Beech	1.4	—	Ditto, white	27	153	13.5
2	Oak	2.4	—	Hard, fairly-rich in substances	36	132	14
	Beech	4.4	—	White	30	170	13
3	Oak	2.5	—	Fairly mild	43	140	11
	Beech	2.9	—	White	27	170	12
4	Oak	1.5	—	Mild	29	160	18
	Beech	2.9	—	White	27	155	13
5	Oak	2.0	—	Tolerably rich in substances	27	105	20
	Beech	2.0	—	White; year rings from 1.7 to 3 mm.	27	180	15
6	Oak	0.6	—	Very narrow ringed speckled	22	150	21
	Beech	2.5	—	White	28	150	12
7	Oak	0.6	0.45	As No. 6	17	170	25
	Beech	1.4	0.62	White	21	204	16
8	Oak	1.7	0.59	Narrow ringed; poor in substance	23	140	25
	Beech	2.2	0.64	White	23	140	12
9	Oak	3.0	0.70	Rich in substances ..	39	150	11
	Beech	2.0	0.69	Rather red on edges ..	28	180	11
10	Oak	3.3	0.71	Very rich in substances	35	160	15
	Beech	2.2	0.74	Quite red	26	150	12
11	Oak	1.5	0.57	Less rich in substances	27	170	19
	Beech	2.1	0.72	Half red	24	150	10
12	Oak	1.4	0.52	Slightly rich in substances	27	160	20
	Beech	2.1	0.73	Red	29	150	12
13	Oak	2.0	0.65	Fairly mild, but rich in substances	26	130	21
	Beech	2.4	0.58	One-third red; very soft	22	230	11
14	Oak	2.0	0.68	Like No. 13	26	130	21
	Beech	3.0	0.59	Quite red, very soft ..	23	165	15
15	Oak	3.0	0.65	Rich in substances; year rings thereon 1.7 to 4.5 mm.	27.5	130	15
	Beech	2.5	0.68	Red, horizontal cracks	28	165	12
16	Oak	2.7	0.64	Rich in substances ..	30	145	15
	Beech	2.0	0.65	Red, horizontal cracks, slightly blue	24.5	145	10
17	Oak	2.0	0.61	Mild, poor in substances	28	130	19
	Beech	4.0	0.59	A quarter red and uneven grain	24	175	10
18	Oak	2.0	0.57	As No. 17	29	140	16
	Beech	4.0	0.60	As No. 17	21	160	16
19	Oak	1.7	0.59	Narrow ringed, poor in substance	25.5	140	20
	Beech	4.2	0.66	Wide ringed, white, rotten at end	28	140	11
20	Oak	1.4	0.57	As No. 19	24	135	22
	Beech	4.2	0.65	As No. 19	24	135	12
				Total ..	**582 : 511,5**	**2823 : 3267**	**363 : 248,5**
				Average	**29,1 : 25,5**	**141,2 : 163,4**	**18,2 : 124**

(a) Tests with stair-treads of 100 cm. long, 4.8 cm. wide, and 4.0 cm. strength.
(b) Comparison of the breaking times:—

OAK.

No. 3. Highest breaking point, 43 minutes.
No. 7. Lowest breaking joint, 17 minutes—difference 26 minutes.

BEECH.

No. 2. Highest breaking point, 30 minutes.
Nos. 17 and 18. Lowest breaking point, 21 minutes—difference 9 minutes

The pieces under test ere not specially prepared for the purpose. They were drawn from a wood depot, where they had already been lying several years. They were intended for use in building, and can therefore, on the whole, be looked upon as the material which is generally used for building.

In the case of the oak we have narrow and broad-ringed pieces, mild and tough pieces, hard wood, and wood rich in substances. The year rings ranged from 0.6 to 3.3 m.; the specific weight was between 0.45 and 0.71; therefore only very heavy hard oaks were missing. The beech, in the main, came from a sandy and chalky soil.

Owing to the strong inclination of the beech taken from the first-named soil to split, a great part of this material had to be thrown out, but, on the whole, the pieces used for test can be looked upon as the average quality used for stair-treads. We have here quite white, red-striped, and quite red wood, with year rings of from 1.4 to 4.4 m. in breadth, and of the specific weight of from 0.58 to 0.74.

Whilst in the case of the oak, the difference that quality makes has a great influence on its breaking point, this makes practically no difference in the case of the beech; even a piece of wood which has lain in the forest for some time and is looked upon as poor material, does not seem to be influenced much so far as its carrying powers go. In order to make this clearer, Tables V., VI., and VII. show the times at which the woods broke according to their specific weight, colour, and year rings.

TABLE V.

Tests arrangement of the breaking points according to specific weight:—

Specific Weight. mm.	Oak Minutes.		Beech Minutes.	
0·45	17	Average 24·6 Min.		
0·52	27			
0·57	24, 27, 29			
0·58			22	Average 22·5 Min.
0·59	23, 25·5		23, 24	
0·60			21	
0·61	28	Average 30·2 Min.		
0·62			21	Average 25·2 Min.
0·63

	28			
	21			
	23			
Together	210	119	130.5	52
Average	26.2	23.8	26.1	26.0

In the case of the oak, the carrying power is clearly dependent upon its weight and its age, and on the breadth of its year ring. In the case of the beech, the carrying power rises with the specific weight, whilst the breadth of the year ring does not influence it at all. Colour scarcely comes into account.

It should be specially pointed out that the light mild oaks fell far behind the beech in their carrying powers when the average was taken. The age of the pieces of wood under test was considered, our reason for this being that horizontally-standing pieces of wood must have a greater carrying power than those which are lying flat. The tests did not furnish any special data for judgment on this question.

According to the tests of Series C and the observations made in connection with them, the question as to the greater or lesser usefulness of the woods for staircase purposes in their relation to danger from fire would be answered as follows:—(1) Oak, which is tough, rich in substance, and heavy, is decidedly superior to beech. (2) Light oaks, which are mild and poor in substance, break sooner, on the whole, than the beech tested. They are, however, of less value than the latter. (3) Beech shows a greater evenness than oak, and it is, therefore, easier to judge of the usefulness of the wood for this purpose. (4) It is not possible in the case of any particular wood only to admit certain qualities of the wood—that is to say, mild, light oaks, cannot be absolutely excluded. It is not possible, speaking generally, to give the oak preference over the beech.

BRITISH FIRE PREVENTION COMMITTEE'S OFFICIAL TESTS.

High Pressure Tanks for Country Houses.

The tests under review deal with the efficiency of a fire tank, which was put before the British Fire Prevention Committee, and tested at their Regent's Park station, and in respect to which a report has now been issued. The illustration presented describes the appliance.

The idea under-lying the invention is that a high-pressure supply of water should be obtainable in premises where there is no water supply, or where the mains have not a sufficiently high pressure, as, for instance, in country houses.

The tanks are made to various sizes, or several tanks can be linked together. They come into operation automatically, but can be brought into action with the aid of a lever.

The actual appliance tested had a capacity of 125 gallons, and this appliance was subjected to a number of tests working, both in connection with an ordinary hydrant and hose and in connection with sprinklers.

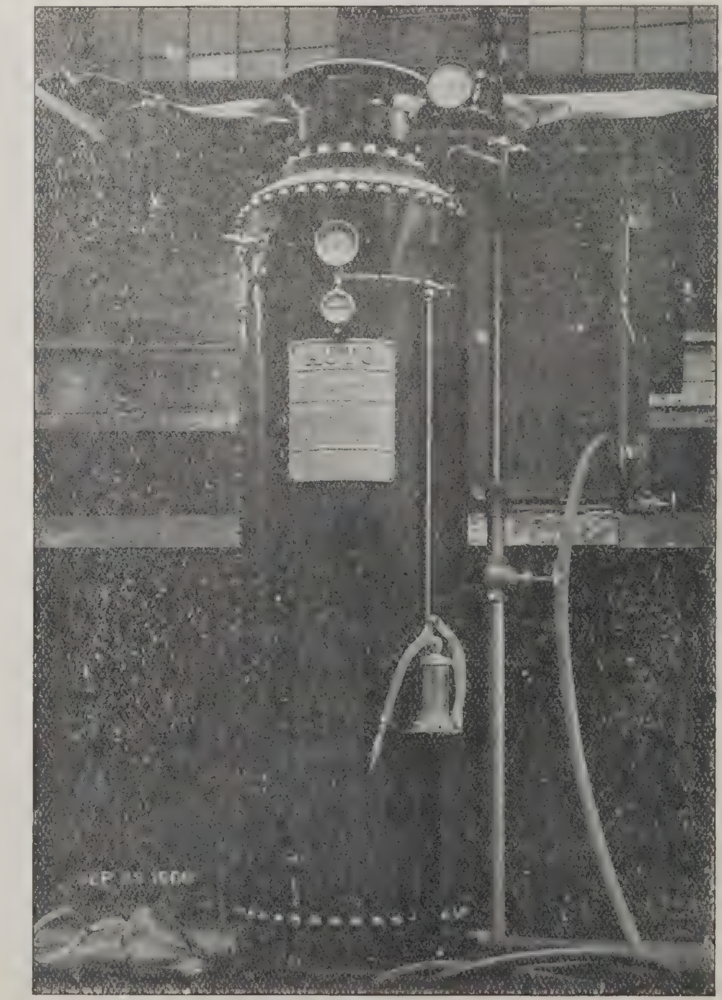
Summarised, the appliance appears to have had a considerable efficiency, but the discharge of the stream of water was much broken by gas bubbles. It certainly worked at very high pressures, and with considerable mechanical force, for instance, the possible discharge through the nozzle of the hose being 48ft., with a maximum of 65ft.

Architects having to specify precautionary measures in country houses, would do well to study the British Fire Prevention Committee's report, No. 131, in respect to this appliance, for it affords a considerable amount of useful technical detail.

The test itself, it should be added, was conducted under the usual procedure of the committee, Major General Festing, C.B., attending for the Council, Mr. Edwin O. Sachs, F.R.S.Ed., attending for the Executive, and there being a sub-committee directing the testing operations, which comprised Mr. Ellis Marsland, as directing member, with two fire brigade officers and an insurance surveyor, and Mr. Percy Collins, J.P., whose investigations on questions relating to the smaller extinguishers are so well known.

REINFORCED CONCRETE BUILDINGS IN TORONTO.

Two reinforced concrete buildings, says "The Financial Times," each 104ft. wide and 377ft. long, are being built at the stock-yards at Toronto, to replace structures destroyed by fire last summer. The new buildings are fireproof to exterior fires, the only timber used being in the roofs, which are covered with felt and gravel. The 14in. by 24in. columns are on about 15ft. to 16ft. centres, and the curtain walls, 8ft. high, are 6ins. thick. The windows are glazed with wire glass, and have metal frames." It is a pity that the roofs were not constructed of reinforced concrete also. We should hardly endorse the statement that they were fireproof to exterior fires, if the roofs are vulnerable.



HIGH PRESSURE TANKS FOR COUNTRY

Federation News.

SUNDERLAND AND DISTRICT ASSOCIATION.

Secretary: W. H. Hope, Solicitor.

At a meeting of the Executive Council of the Sunderland and District Association, held in the board-room, on March 2nd, the secretary reported that since the last donation was given to the Mayor's Distress Fund £2 6s. 6d. had been received from members. On the proposition of the president, seconded by Mr. W. B. Cooper, it was resolved:—"That the amount received be forwarded to the Mayor's Distress Fund in the name of the association."

The question of the second year's issue of the telephone directory was considered. It had been proposed that the association should issue a telephone directory, containing twelve flaps or leaves of thin cardboard enumerating the different trades, and also a list of the different professions, giving the names, addresses, telephone numbers, and telegraphic addresses. It was thought that this would be handier than the present large card (13in. by 21in.). The cost of the new proposal was considered to be too much, and that a card similar to last year's should be issued this year.

The secretary reported that formal notice of alteration to the working rules had been given to the bricklayers, from whom the following counter-proposals had been received:—(B) From November 8th until November 27th (both inclusive), all men shall start work at 7 a.m. and cease at 4.30 p.m., with 20 minutes for breakfast and 40 minutes for dinner, except on Saturdays, when work shall cease at 12 noon, with half-an-hour for breakfast (47 hours per week). (C) From November 28th until January 24th (both inclusive), all men shall start at 8 a.m. and cease work at 4.30 p.m., with half-an-hour for breakfast and one hour for dinner, except on Saturdays, when work shall cease at 12 noon (36½ hours per week). (D) From January 25th until February 13th (both inclusive), all men shall commence work at 7.30 a.m. and cease at 5 p.m., with half-an-hour for breakfast and one hour for dinner, except on Saturdays, when work shall cease at 12 noon (44 hours per week)." They also proposed alterations as to rules 5 and 12, and general rule as follows:—Rule (5) paragraph (2): "A lock-up shed with fire shall be provided for the sole use of the workmen, in which they can have their meals and store their tools when not in use." Rule (12): "These rules shall be binding on employers and operatives alike, and shall only be altered after the expiry of six months' notice, given between September 1st and February 14th. In the event of either employers or operatives giving notice on the last day of the term (February 14th), 14 days be allowed the other side in which they may send in a counter-notice." General alteration to Rule (2): "That from February 13th until November 7th an eight-hour day be worked on Monday, Tuesday, Wednesday, Thursday, and Friday, and four hours on Saturday (44 hours per week).

On the proposition of the president, seconded by Mr. W. B. Cooper, it was resolved:—"That the Executive Council now frame the hours of labour to be suggested to the operative bricklayers, and ask them to give them consideration: (B) From November 8th to November 20th (both inclusive), all men shall commence work at 7 a.m. and cease at 4.30 p.m. (instead of 5 p.m.), with half-an-hour for breakfast and one hour for dinner, except on Saturdays, when work shall cease at 12 noon, with the usual half-hour for breakfast, making a total of 44½ hours per week. (C) From November 21st until January 31st (both inclusive), all men shall commence work at 8 a.m. and cease work at 4 p.m., with no time allowed for breakfast and one hour for dinner, except on Saturdays, when work shall cease at 12 noon, making a total of 39 hours per week. (D) From February 1st until February 20th (both inclusive), all men shall commence work at 8 a.m. and cease work at 4.30 p.m., with no breakfast time and one hour for dinner, except on Saturdays, when work shall cease at 12 noon, making a total of 41½ hours per week." It was also decided that this amendment should apply to the joiners, and that formal notice should be given them accordingly.

The question of whether any amendments are necessary in the National form of contract was considered, and, on the motion of the president, seconded by Mr. W. B. Cooper, it was resolved:—"That a small sub-committee, consisting of the president, J. W. White, F. W. Ranken, W. B. Cooper, and the secretary, meet together to discuss the matter."

The report of the Conciliation Board meeting, held on January 20th, was received.

The following were elected members of the association:—T. H. Dunwoodie, builders' merchant; William Davison, builder.

SHEFFIELD ASSOCIATION.

Secretary: Thos. Smith.

The monthly meeting of the Sheffield Association was held on the 11th ult., when Mr. W. W. Mears (the president) presided over a large attendance of members.

Previous to the meeting the committee met a deputation from the Sheffield Master Plumbers' Association for the purpose of discussing the increasing tendency of the City Council to do plumbing and other work to the detriment of various branches of the building trade, or at least to the detriment of persons engaged in the trade. It is held that it is unfair on the part of the City Council to enter into competition with its own ratepayers, and it is evident from the attitude of both associations that any apology for the institution of a works department will be met with uncompromising opposition. The present agitation mainly arose out of a resolution of the City Council authorising any department to carry out independently any work, the value of which did not exceed £10. But, said Mr. Councillor Hobson, in introducing the deputation, work might be started which was estimated to cost £10, and it might subsequently be found that very much more was required, so that in the end the work might assume fairly large proportions. Mr. Biggin pointed out that the City Council, in taking over the old water company, took over a repair department. Mr. Corrie said that in 1898 a resolution was passed by the City Council that plumbing work should be carried out by the corporation's workmen at the cost of labour and material only, but this resolution was not put into effect until the works construction department was abolished. The final result was that officials were multiplied and gradually took on work "in order to keep the department employed," and a profit was shown as an apology for its existence, although such a profit was absolutely in contradiction to the resolution which led to its inception. It was eventually decided that both associations consider the matter separately, and subsequently meet again to decide on a joint action it would be deemed advisable to take.

At the monthly meeting a letter was read from the operatives' secretary of the local conciliation board, advising the association that at a meeting of the operatives' delegates resolutions had been passed protesting against the statement of the secretary of the association, conveyed in a letter to the town clerk, that it had always been a custom and was not denied that walking time was not paid when men were engaged and paid on the job. Further, the delegates claimed that they had never had an oppportunity of denying this, and they also passed a resolution protesting against a letter being written to the town clerk in reference to a fine of £24 which had been imposed on one of the association's members after the meeting of the conciliation board, which had been called to discuss the action of a section of the operatives in bringing the case to the notice of the City Council before reporting to the Master Builders' Association. The matter, however, led to no special discussion, as since it was written a trades committee of the conciliation board had met to consider the abolition of walking time, out of which the case had arisen.

A further letter was read from the secretary of one of the local bricklayers' societies, complaining that one of the association's members was starting men at 8 instead of 7 a.m. It was explained that short time was imperative in this case, and the other local bricklayers' society had agreed that it would not constitute an infringement of the rules if the men during the period of short time commenced at quarter-time, viz., 9 o'clock. This was satisfactory to the firm concerned, and, as a matter of fact, was their original suggestion, but the other bricklayers' society, who laid the complaint, had complained that it was out of order for one of their societies to settle a matter without the sanction of the other. This little quibble had, however, been satisfactorily adjusted, and the whole matter was now amicably settled.

A letter was read from the secretary of the Antwerp Master Builders' Association thankink the Association for its invitations for the Belgian builders to visit Sheffield. (Since the meeting a further communication has been received, saying that the return visit has been provisionally fixed for the second week in August.)

Mr. Sivil gave a report of the meetings of the Chamber of Commerce which he had attended as one of the representatives of this association, and reminded the meeting that members of the Master Builders' Association are now included in the committee for the consideration of the corporation new by-laws. Another important matter affecting builders which the Chamber had considered was that of railway rates, and it had been shown that goods could be brought cheaper from Germany than they could be sent from Liverpool. Mr. A. J. Forsdike referred to the experience of his own firm with the Midland Railway Co., in regard to rates for stone, and said the matter was one which demanded the early and close attention of the association.

The action of the Bridlington Association in regard to a Sheffield member who had given a quotation for slating at Bridlington in competition with a local firm, was considered. It was explained that the recipient of the quotation had been told by his association that he was liable to a penalty if he accepted the tender of an outside firm. It was thought that this was not what was intended by the inter-trading rule; but as the matter had been passed forward to the Yorkshire Federation for consideration, it was deemed advisable not to consider the matter further at the moment.

The question of the advisability of all members of the association being covered by insurance against their liability to third parties (the general public) was considered at some length, and the secretary presented quotations from several insurance companies. The policy of the association required was one which would cover a specified amount of damages for any one accident, but which would be limitless as to the number of accidents in the year, and a further condition which had been imposed was that any legal expenses should be covered by the policy over and above the amount stated in the policy. On these lines the quotations had been given, and after consideration it was resolved that the Ocean Accident and Essex and Suffolk Companies be recommended. The rates of the two companies varied somewhat, but their basis for £100 cover was the same, the differences arising in the main from individual amounts of wages.

A report was given by Mr. Biggin of the arrangements which had been made with the City Council and City Police in regard to the question of builders' hoardings, which formed the subject of a case in court, which has already been fully reported in the "Builders' Journal." They had been met very considerately by the Council, who had informed them that it was their intention to require a close-boarded hoarding in suburban positions where there was a minimum of traffic; but under section 34 of the Public Health Act, 1890, builders were required to put up a hoarding to the satisfaction of the City Council, and this they were quite prepared to do. It had been further agreed that in case of any difference of opinion in regard to a hoarding in any position, the City Council would be prepared to receive a deputation from the association to discuss the matter on its merits with the object of establishing a precedent for any similar position. Mr. Sivil said Mr. Biggin had given the result of their interview a somewhat rosy complexion, but the salient points were as he had put them, and the result of the interview had been most satisfactory to all parties concerned.

The suggested form of certificate to be given by workmen on entering employment under the provisions of the Workmen's Compensation Act was considered at the request of the Yorkshire Federation, but it was felt that at Sheffield at least the matter might be shelved for some little time, and the association felt inclined to see what other associations in the Federation proposed to do, before taking any definite action in the matter.

THE MASTER BUILDERS' ASSOCIATION OF NEW SOUTH WALES.

(*Concluded from p.* 312, *No* 739.)

Relations with Architects.

The committee have much pleasure in announcing that the relations between this association and the Institute of Architects have been so cordial and excellent in every way as they have ever been. There has been a slight increase in the demand for the association's conditions of contract, and no trouble has been experienced during the year in this connection. The most important matter included during the year was the final adoption by both bodies of the quantity system. It was near the half-year when this matter was finally concluded, and a booklet containing fullest information was published jointly by the Institute and the association. It took some little time to make architects outside the Institute fully acquainted with the matter, but everything is now working smoothly, and the introduction of the system has been advantageous to builders, architects, and their clients. The committee look forward to the time when the system will become universal for all contracts, large and small, Government and private. A deputation from the association waited on the Hon. C. A. Lee, Minister of Works, *re* the introduction of the quantity system into Government works, and was well received. Mr. Lee promised to give the system a trial on three or four large works for which tenders are shortly to be called.

With the first half of the year the old Industrial Arbitration Act expired by effluxion of time, and the Industrial Disputes Act, a measure providing for Wages Boards for different trades, with right of appeal to an Industrial Court, came into force. This Act met with a great deal of opposition from the Labour Council, and many of the unions, on account of its recognition of the rights of non-unionists, though a good number of unions have registered, and several disputes have been settled by the Boards. Partly through the opposition to the Act and partly through the increase of general prosperity in the State of recent years, a great deal of industrial unrest has been aroused, and strikes have occurred in many trades. So far there has not been much trouble in the building trades, but the unions in these trades have recently been organised into a federation, and it behoves all employers in the building trades to be on the *qui vive*, and to be strongly organised. Partly for this reason and partly with another object in view a sub-committee has been appointed to devise the best methods of increasing the membership of this association.

Early in the year the Painters' Union, failing to secure a conference with the Master Painters' Association to discuss their grievances, went out on strike. Neither side being very efficiently organised, the strike dragged on with little or no advantage to either side until the Painters' Union appealed to this association to mediate. Our members being keenly interested, either directly or indirectly, it was decided to hold a conference with the men, and invite the Master Painters' Association to join. This they refused, and conferences were held without them. An agreement was drawn up and submitted to the Master Painters' Strike Committee, but they refused to become a party to the agreement, and an appeal was made to the Arbitration Court. An award and common rule were granted, and the whole matter was settled in very quick time, thanks to the organisation of this association.

During this year the association has not been able to take an active interest in the apprentice question, but the advice of the association has been sought by associations in other States and by the Arbitration Court, and your committee trusts to be able to take another and more decided step forward early in the new year.

The association, by private subscription among the members during 1907, donated prizes to the principal classes connected with the building trade at the Technical College. These were presented at our own rooms during 1908, in the presence of representatives from the Technical College, Institute of Architects, and our own members.

With a view to popularising the idea, and continuing the prizes for future years, it has been decided to limit the amount of subscriptions, and it is hoped that every member will subscribe. A good response has been made so far, but as the account is not yet closed, the amount promised, some of which is in hand, does not appear in the balance-sheet.

The Royal Commission on Forestry, appointed in 1907, was sitting for nearly eighteen months, travelled over every possible part of the State, taking evidence and enquiring into all phases of the question. The Commission obtained evidence from this association, and sought our advice as to the suitability of certain timber grown in Australia, but not native to the country, and finally presented to Parliament a most valuable report, which contains every recommendation put forward by this association. The Government cannot be too strongly urged to take immediate action on the lines laid down in the report in order to prevent the threatened extinction of our local timber supplies.

Early in the year the Government appointed a Royal Commission to consider what steps should be taken to improve the city of Sydney and the means of access from the suburbs. The president of the association was appointed to a seat on the Commission, as a recognition of the status of the association in the practical business life of the State. The Commission has been sitting continuously for nine months, and still has a great deal of hard work before it can present its report, but it is believed that when the report is presented, some valuable and sound projects will be brought forward and promptly acted upon.

The report is signed by Mr. James Wall (president) and Mr. N. Phelps Richards (secretary).

The figure of Aristotle, by Mr. G. Walker, has recently been placed in the niche prepared for it outside the south wall of the residence. It is the gift of the Dean of Lincoln and Mrs. Wickham. The four niches outside St. Deinol's are intended for figures of those four great men who were regarded by Mr. Gladstone as his chief masters—Aristotle, St. Augustine, Dante, and Bishop Butler. Three are now in position, all of them the work of Mr. Walker.

Trade and Craft.

Johnson's Lattice System of Reinforced Concrete.

In Johnson's lattice system of reinforced concrete, as described and illustrated in a booklet that has been issued by Messrs. Richard Johnson, Clapham and Morris, Ltd., 24 and 26, Lever Street, Manchester, the reinforcement consists of lattice made from 3 to 13 gauge drawn-steel wire, which can be laid in lengths up to 200ft., thus forming a continuous bond for that distance. Wire of heavier gauge is laid in lengths up to 50ft., which may be lengthened by hooking any number of lengths together. In a building, say 200ft. long, the reinforcement is secured at the front and rear of the building, and is carried through the entire length without a break. In this system all reinforcement is on direct lines of tension. In fire-resisting floor construction it meets the requirements of strength, lightness, efficiency and reasonable cost, and methods of employing it in this class of construction are illustrated in the firm's booklet, and are particularly well shown in early stages of the construction of the floors of Transvaal University College, Johannesburg, South Africa, where 6,100 square yards of Johnson's lattice were used, and where every roll of the material arrived in perfect order after much handling and a journey of 7,000 miles; and in the floor of the club building of the Commercial Travellers' Association, New South Wales. The strength of the system is demonstrated very effectively by a view and a section showing its employment for the cover or deck of the conveyor subway, Dock No. 9, Manchester Ship Canal, where it carries heavy locomotives (44½ tons) and cranes, and withstands the impact of heavy goods unloaded from large steamers. The Johnson system has been also adopted for the deck of the railway pier at Ryde, Isle of Wight, for floor construction in the Savoy Hotel extensions, where 34,000 square yards were used; for the decking of the bridge over the Regent's Canal, Regent's Park, which was constructed by H.M. Office of Works; and in many other important buildings at home and abroad. Useful shipping measurements, and other particulars that are of special interest to transporters, are included in the booklet.

Coming Events.

Saturday, April 17.

NORTHERN POLYTECHNIC ARCHITECTURAL AND BUILDING STUDENTS' ASSOCIATION.—Visit to Lambeth Palace, 3.30 p.m.

BUILDING TRADES EXHIBITION AT OLYMPIA. Opening Day.

Saturday, April 17.

ARCHITECTURAL ASSOCIATION (18, Tufton Street, Westminster).—Visit to Building Trades Exhibition, Olympia, 3 p.m. Tea in the Pavilion (on the invitation of Mr. H. Greville Montgomery, M.P.), 5 p.m. Tickets to be obtained from the Secretary of the Association.

Monday, April 19.

ROYAL INSTITUTE OF BRITISH ARCHITECTS (9, Conduit Street, Hanover Square, W.).—Mr. W. E. Riley, F.R.I.B.A., Superintending Architect of Metropolitan Buildings, and Architect of the London County Council, on "The Architectural Work of the London County Council," 8 p.m.

INSTITUTION OF HEATING AND VENTILATING ENGINEERS (99, Fonthill Road, Finsbury Park, N.).—Last day for sending in hospital competition schemes.

Tuesday, April 20.

NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS.—Visit of members to the Building Trades Exhibition, Olympia, 5.30 p.m.

Friday, April 23.

SOCIETY OF ARCHITECTS (Staple Inn Buildings, E.C.).—Visit to the Building Trades Exhibition.—Dinner at the Trocadero Restaurant, 6.30 p.m.

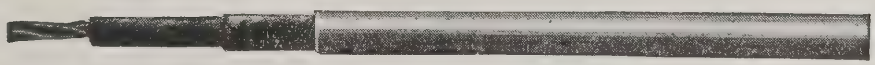
THE
O-S WIRING SYSTEM.

INEXPENSIVE. DURABLE. RELIABLE.

KUHLOS WIRE.

Brass-Cased, suitable for inexpensive surface wiring in dry interiors. Single or twin.

STANNOS WIRE.



Cased with tinned copper, and rendered homogeneous by a special process, suitable for inexpensive surface or concealed wiring in any position. Can be used as a concentric system, with a double wound Transformer or private plant, when it is cheaper than surface flexible.

"METACASE" CONDUCTORS
(PATENTED)

Semi-flexible.

Watertight.

Mechanically protected.

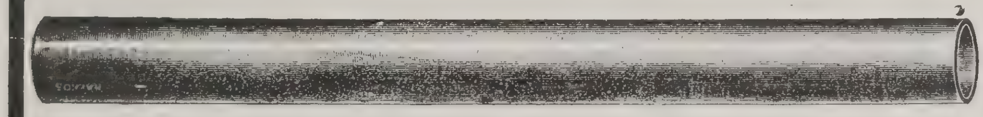
Perfect continuity with patent continuity fixture.

No condensation.

No bends or elbows.

Standard accessories.

KALKOS CONDUIT.



Tinned Brass Conduits and Fittings. Suitable for high-class draw-through surface or concealed wiring in any position. Can be used as a concentric system, and may be combined with Kuhlos or Stannos Wires.

KALKOS CONDUITS

Watertight.

Mechanically protected.

Perfect continuity.

No condensation.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 15. BRIDLINGTON.—Erection of a greenhouse at the corporation nurseries, Quay Road, for the Corporation. Plan and specification of E. R. Matthews, borough surveyor. Tenders, endorsed "Greenhouse," by April 15, to A. E. Matthewman, town clerk, town hall, Bridlington.

IRON AND STEEL.

April 15. CHEPPING WYCOMBE.—Supplying Cast-iron pipes and fittings, surface covers, stopcocks, and bib-cocks, and galvanised steam tubes and fittings, for the Corporation. Specifications and forms of tender of T. J. Rushbrooke, waterworks engineer, 77, Easton Street, High Wycombe, to whom tenders are to be sent by April 15.

April 17. BRAINTREE, ESSEX.—Delivery and erection of a new square stamped steel tank in the tank yard, Braintree, for the U.D.C. Drawings, specification, and form of tender from the engineer, Percy Griffith, M.Inst.C.E., F.G.S., 54, Parliament Street, Westminster, S.W., on deposit of £2. Tenders, endorsed "Contract No. 4," to be delivered by April 17, to Herbert J. Cunnington, clerk to the council, Braintree, Essex.

PAINTING.

April 15. STAFFORD.—Painting work for the corporation. Forms of tender and other particulars on application to W. Blackshaw, borough engineer, Borough Hall, Stafford. Sealed tenders to be delivered at the office of R. Battle, town clerk, Borough Hall, Stafford, by April 15. Fair wages clause.

April 15. PLYMOUTH.—Painting the lodge, lavatories, etc., at the Victoria Park, for the Corporations of Plymouth and Devonport and Stonehouse U.D.C. Specification and form of tender at the offices of the engineer and surveyor. Tenders by 5 p.m. on April 15, to James Paton, borough engineer and surveyor, Municipal Offices, Plymouth.

April 17. BACUP.—Painting and decorating the chapel, school, and vestries of Beulah Chapel, for the trustees. Specifications and information of M. R. Chestney, Deansgreave, Britannia, Bacup, to whom tenders are to be sent by April 17.

April 22. CROOK (DURHAM).—Painting, etc., the Westgate Council School, for the Durham County education committee. Specifications and form of tender of S. A. Meddick, 11, Belle Vue, Crook, R.S.O., to whom tenders must be sent by April 22.

PLUMBING & SANITARY

April 15. NEW DELAVAL.—Providing and laying about 3,000 yards of 4in. and 3in. water mains, together with sluice valves, hydrants and other fittings, at New Delaval, for the Tynemouth R.D.C. Plans and specifications at the office of A. S. Dinning, 21, Ellison Place, Newcastle-on-Tyne. Tenders, endorsed "New Delaval Water," by noon on April 15, to A. Whitehorn, clerk to the council, 60, Saville Street, North Shields.

April 17. LYTHAM.—(1) Laying 270 yards of 24in. earthenware pipes and 52 yards of cast-iron pipes, with sea outfall, manholes and other works; (2) laying 184 yards of 18in. and 962 yards of 24in. earthenware pipes, and 8 yards of 18in. and 24 yards of 24in. cast-iron pipes, with storm overflow chambers, manholes and other works, for the U.D.C. Plans and specifications, bills of quantities, and forms of tender at the office of the engineer, A. J. Price, Council Offices, Lytham, on deposit of £2 2s. cheque. Tenders, endorsed "Sewerage Works, Contract No. 1," or "Contract No. 2," by noon on April 17, to Chas. A. Myers, clerk to the council, Council Offices, Lytham.

April 20. HALTWHISTLE.—Construction of about 2,500 yards of 9in. and 6in. glazed earthenware pipe sewers with manholes, lampholes, flushing chambers, a cast-iron inverted syphon under the River Irthing and works in connection therewith for the sewerage of Gilsland, together with tanks, bacteria beds, and other works for sewage purposes, for the R.D.C. Plans and specifications, and other particulars on application to the engineer, J. E. Parker, A.M.I.C.E., Post office Chambers, St. Nicholas' Square, Newcastle-on-Tyne, or to the council offices, Haltwhistle, on deposit of £1 1s. (cheque). Tenders, marked "Gilsland Sewage," before noon on April 20, to Thomas Dryden, clerk to the R.D.C., Haltwhistle.

April 20. BELFAST.—Sewering, paving, etc., new streets, to be completed during the next twelve months, for the Corporation. Specification and form of tender of the city surveyor on deposit of £1 1s. Tenders, endorsed "Tender for Streets," by 10 a.m. on April 20, to Robert Meyer, town clerk (pro tem.).

May 3. DAWLISH.—Laying about 2½ miles of stoneware pipe sewers and other incidental work in accordance with drawings and specifications prepared by the engineer and surveyor to the council, for the U.D.C. Drawings and conditions, specifications and bills of quantities at the office of the engineer and surveyor, S. F. C. Churchward, Dawlish, on deposit of £3 3s. Tenders by May 3, endorsed "Tender for Sewers," to Francis S. Cole, clerk to the council, Dawlish.

ROADS AND CARTAGE.

April 19. BROADSTAIRS.—Supplying and delivering 1,375 feet run of 6-in. by 12-in. granite kerbing (straight), 55 feet ditto (circular, 6 ft. radius), 2,320 feet run of 12-in. by 6-in. granite channelling (straight), for the Broadstairs and St. Peter's U.D.C.. Tenders endorsed "Tender for Granite Kerbing, etc.," by noon on April 19, to Lionel A. Skinner, clerk to the council, council offices, Broadstairs. Forms can be obtained from H. Hurd, C.E., town surveyor, council offices, Broadstairs.

April 19. PLYMOUTH.—Making-up and completing, under section 150 of the Public Health Act, 1875, the following streets.— 1, Holland Road; 2 Apsley Road, section 2, for the Corporation. Plans and specifications, and conditions, and bills of quantities of James Paton, borough engineer, Municipal Offices, Plymouth, to whom tenders must be sent by 5 p.m. on April 19.

April 19. EBBW VALE.—Draining, forming, ballasting, kerbing, channelling, paving, erecting boundary walls, and otherwise improving Wall Street and William Street, Ebbw Vale, for the U.D.C. Plans, sections, and specifications, and form of tender, with bills of quantities, of T. J. Thomas, town engineer and surveyor. Tenders, endorsed "Tenders for Street Improvements," by noon on April 19, to Tho. Hughes, clerk. £1 deposit.

April 22. GLOUCESTER.—Supplying stone and hauling, for the R.D.C. Forms of tender at the offices of the council, Gloucester, and from F. E. Weaver, district surveyor. Tenders, endorsed "Tenders for Stone," or "Tenders for Hauling," by April 22, to Herbert H. Scott, clerk to the council, Berkeley House, Berkeley Street, Gloucester.

April 22. NEWMARKET.—Supplying broken granite and slag of the following sizes:—Granite: 1,000 tons 2½in.; 300 tons 1in. to 1¾in.; 200 tons ½in. to ¾in. Slag: 300 tons 2½in. to 1¾in.; 200 tons 1½in., for the U.D.C., to be delivered as may be ordered before March 31, 1910, at Newmarket and Burwell Stations (G.E.R.). Forms of tender on application to S. J. Ennion, clerk to the council, together with samples, at the town hall, Newmarket, by noon on April 22.

April 27. NORTHFLEET.—Levelling, paving, metalling, kerbing, channelling, and making good Havelock Road and the southern end of Stanbrook Road, Northfleet, for the U.D.C. Conditions and forms from the district surveyor, The Hill, Northfleet. Separate tenders must be made in connection with each road. Tenders by 4 p.m. on April 27, to the council offices, The Hill, Northfleet.

MISCELLANEOUS.

April 24. ROSEDALE.—Re-seating Rosedale Church with pitch-pine. Tenders to be sent to the Vicar by April 24.

April 21. GLASGOW.—Supplying for one year from June 1 brass furnishings, plumbers' furnishings, M.I. steam goods, india-rubber and asbestos goods, cartage of breeze and ashes, for the Corporation. Forms of tender and particulars on application to William Thomson, general manager, 187, George Street. Offers, marked outside "Tenders for ——, Baths Department," by April 21, to A. W. Myles, town clerk, City Chambers, Glasgow.

April 28. BRADFORD.—Supply and erection of natural draught chimney type cooling towers, for the Corporation. Specification, general condition of contract, and forms of tender from Thomas Roles, city electrical engineer and manager, electricity offices, Whitaker Buildings, Bradford, on deposit of £1 1s. Tenders by first post on April 28, endorsed "Contract R. 7," to Frederick Stevens, town clerk, Town Hall, Bradford. Fair wages clause.

THE

Federated Employers' Insurance Association, Ltd.

HEAD OFFICES:

Our Exhibition Number. We present our Exhibition number in the hope that it will be found worthy of the important fixture that inspired it. It endeavours to present in an interesting and helpful manner information about the many wonderful exhibits now housed within the walls of Olympia. If it proves useful to our readers in this respect, it will have done all that we intended. And that is all we desire to say about it. For the rest it must make its own appeal and prove its own merits and recommendation. At the moment of going to press we learn that a second edition will be required; and should any delay occur in the delivery of copies, we ask the indulgence of our readers.

The Soul of the Exhibition. When one contemplates from the gallery of Olympia the great collection of structures, erections, and stands, that represent the material activities of the great building industry—new risen as it were a town in a night—one is moved to some amazement at the vast amount of effort and energy which has been expended, some feeling of pride in the fitness and completeness of the thing as it presents itself; and not a little feeling of regret that withal it has so brief a life. One is tempted to feel—there being so much that is beautiful, so much that is amazingly ingenious or useful, so much that is the outcome of patient labour and hard thinking—that a fortnight's brief life but ill requites it. There is no little sadness in the thought that the third of May will find the hand of the destroyer busy in the disintegration of what has given so much pleasure and has proffered so much information—to think that the works of Mr. Lutyens and Mr. Atkinson must be resolved into their original bricks, that the rose-clad bungalows and the little tulip beds will have vanished, and the quiet hum of life in this city of possibilities will have given place to the hammering of destruction and the ethics of the pick. There are many who will feel like that; many whose business or pleasure will take them so frequently to Olympia in the next ten days, that the inevitable end will leave them with a sense of loss—with only a memory and the sadness of recollection.

"The worldly hope men set their hearts upon
Turns ashes—or it prospers; and anon,
Like snow upon the desert's dusty face
Lighting a little hour or two—is gone."

And there are those of worldly hope, who look to the main purpose of an exhibition, to its buying and its selling, to the prospective clients it may bring, to business secured, or to that which is to come. The close may find them weighing advantages or disadvantages, gains or losses, and them perchance the undefined, intangible soul may pass beside. For as a ship must "find herself," so the soul of the exhibition must be born out of the living aims and hopes of these triple hundred stands. And that soul continues, it lives to swell the triumph of things achieved, to weigh in the credit balance of human effort—and its name is Progress.

"All in a Garden Green." The gardening instinct is no doubt most assertive in the springtime. It burgeons in sympathy with the lilac; and blossoms at the bidding of the audaciously lovely almond. It is an opportune moment for Lord Meath's newspaper letter (is it a hardy annual?) advocating window-box culture; nor has the sweet influence of the season been lost upon the "Times," whose leading columns have blossomed forth into a well-tempered encomium of "Nature in London Streets," in which, in particular, are set out some of the joys and some of the disadvantages of planting trees in towns. The chief drawbacks are, it seems, that the trees shut out too much light in summer, unless they are so lopped as to present a pitifully mutilated appearance in winter. Nothing is said of the difficulties of maintaining them in health where their roots are confined beneath artificial pavement in suchwise as to deprive them of their due modicum of moisture; nor of their sufferings from leaky gas mains and electric cables below, and the acid-laden atmosphere above and around them. Nor, on the other hand, is any account taken of the risks to pedestrians in autumn of slipping upon the dark leaves that, in the suburbs, are too often left to rot where they fall, because the scavenging department (*horresco referens*) is not always equal to the extra labour they would impose upon it. But if street trees are a boon, we cannot expect to have it priceless. Trees, the "Times" writer points out, are often a heritage from some rich man's estate, which has now been parcelled into small building plots. Evelyn of Deptford, and Tradescant of Vauxhall, could hardly have dreamt that in process of time the saplings they planted in their spacious domains would, as stately trees, menace the safety of the tiny villas in whose back gardens they now rear their disdainful heads, and whose eaves-gutters they annually choke with their falling leaves. Nasty accidents have occurred during the equinoctial gales, and more are likely to follow as the trees decay with age. This is a matter that deserves more attention than it is likely to receive. The planting of trees and shrubs in the forecourts of suburban residences is often done with as little skill as taste. When the laburnum is ablaze beside the creamy or the purple-flowering lilac, or the so-called acacia is begemmed, the villa behind them is glorified when it is not obscured; but these and other trees are too often planted in positions of which the architect would hardly approve, if he were among the growing band who deign to take such subjects into careful consideration. And so in the matter of window gardening and of climbing plants. The cultivator is usually too much concerned with the growth to care very much for the environment; and consequently that which should adorn the house too often disfigures it. The architect should study this matter—he should find it a delightful recreation—in order that he may be able to set a good example. His labour will not be wasted; for in nothing does imitation spread more swiftly.

Back-to-back Houses. The threatened extinction, in process of time, of back-to-back houses is, we understand, causing much heart-burning in Leeds. Our opinion on the subject was expressed very clearly some months before Mr. Burns made his special reference in reintroducing the Housing and Town Planning Bill; and we were roundly abused for it. We did not retort, because we have more regard for the principle involved than for any merely private interest that may happen to suffer in the process of advancing the public good. When, on the one side, we get a consensus of opinion among sanitarians of high repute, such as those eminent hygienists whose names were cited by Mr. Burns, to the effect that back-to-back houses ought, on public grounds, to be abolished, and when we find that the arguments on the other side are mainly based on a statistical method of very dubious validity, we prefer to side with the scientists. Nor can the æsthetic aspect of the question be lightly ignored. So far, we have not been told that back-to-back houses are beautiful; although that contention would not astonish us more than the claim that they are healthy. That they are cheap, we do not dispute; but cheap and nasty is a saying that seems only too likely to be justly applicable to the case in point. We would earnestly plead with the good folk of Leeds to abandon their prejudices, forsake their bad traditions, and join the rest of the community in a broader view of the situation.

Town Planning.

The advent of the Town Planning and Housing Bill has brought into being animated and interesting discussions in all our papers. The possibilities of town planning, from practical, hygienic and artistic points of view; the question of back-to-back houses; Scotch flats versus English houses; the taxation of land values; these are a few of the great controversies that find their inspiration in Mr. Burns' new measure, now past its second reading. Nor is the contemplated law in its entirety beyond the realms of controversy. Mr. H. R. Garwen Gogay, of Wimbledon, in a letter received reminds us that municipal debt has increased by about £372,000,000 in twenty-two years, and now stands at £564,645,200, a gigantic sum that he believes will quickly reach one thousand millions if this Bill becomes law. Moreover, he questions whether it will not create a huge "Works Department" in every municipality in the Kingdom "a la the L.C.C.;" whether it will not bring needless and undeserved ruin upon thousands of small property owners; whether it will not bring about universal, social and economic ruin in the near future, "and realise the Socialist's dream," by eventually making it impossible for the ratepayers to meet the charges upon this immense "unrighteous debt," which must then be repudiated. "Thus both the Socialist and the selfish Municipal financier" (who forces his "money upon municipalities everywhere, because of the security afforded by the rates") "will be hoist with their own petard." This is a formidable indictment, but, we fear, a little illogical. As the Socialist and the selfish Municipal financier seem to be Mr. Gogay's pet aversions, we suggest that on his own showing it would be desirable to let them do their worst, as eventually they would be "hoist with their own petard," and the municipal debt would be reduced from one thousand millions to nothing, the ratepayers and the community generally benefiting by all the improvements that were carried out. Still, we should be loth to support Mr. Burns' Bill, if it held for us all the awful possibilities which Mr. Gogay portends; but as far as the signs and portents go, we do not think they support Mr. Gogay's contentions. The L.C.C. Works Department and that of Leeds are now numbered, we believe, among the things that were; and Experience, continuing her excellent tutorial work, is leading our municipalities to great searchings of heart on the subject of municipal trading. That all things may be lawful; but that all things may not be expedient is a lesson that requires a considerable amount of application; but once learned is far-reaching in its benefits and influence. And one thing may be advanced against Mr. Gogay's views and that is that if Mr. Burns' Bill had been law fifty years ago the municipalities would have been spared the expense of carrying out many costly schemes, that do not add to the beauty or artistic worth of the towns, but were absolutely necessary to make them fit to live in. The aggregate cost of these improvements makes up a very large percentage of that £564,000,000 of municipal debt which Mr. Gogay mentions, and which is a ransom levied for the sins of the fathers upon their children of the present day.

Street Statuary.

It has been decided that a memorial to the late Duke of Devonshire shall take the form of a statue to be erected at the junction of Horse Guards' Avenue and Whitehall, the site having been granted by the Westminster City Council. Not many years ago, such an announcement would have been greeted with derision by the satirical section of the Press, with whom British statuary was a stock subject of stereotyped jocularity, a favourite opening phrase being, "Another statue is to be inflicted on the long-suffering British public." This warm welcome must naturally have had an inspiring effect on the sculptor. That he nevertheless managed occasionally to produce images of abiding interest was shown by Mr. M. H. Spielmann in the interesting lecture that he delivered at a recent meeting of the R.I.B.A. The lecturer, who, it will not be forgotten, is the author of the standard "History of 'Punch,'" recalled many of the caustic sayings that used to be current concerning our outdoor statuary. Much of the sarcasm could be only too easily justified; but since the advent of Alfred Gilbert and Onslow Ford, of Sir G. J. Frampton, Goscombe John, and Bertram Mackennal, British statuary has afforded but little scope for the sardonic humorist. The sculptors are well enough, and those who commission them show more enlightenment than did the patron of the previous generation; but among the bad old traditions or conventions that still linger are two that still daunt the sculptor. One is that statuary can with impunity be stinted as to cost; the other, that a life-size or colossal and full-length image of the person commemorated is essential. Outdoor statuary should be on the grand scale and in the grand manner, and should not be reduced to insignificance in an effort to keep down the expense. Many, or most, of our public groups are monuments to the meanness of our regard for art. The other convention is doubtless defensible; there is a kind of piety in the wish to keep among us in perpetuity, and in his habit as he lived, the distinguished statesman or warrior—nine times out of ten it is the one or the other—but in that case he is, at a distance, hardly distinguishable from the indifferent crowds that pass him by without so much as a glance; and the production of such a statue is merely an effort at portraiture: it gives no scope to the artist's imagination. The imaginative and artistic sculptor would infinitely prefer the greater freedom accorded in some Continental countries, where a modest bust or medallion of the hero is surrounded by larger embodiments of his achievements or his creations, or by figures emblematic of his career and character.

Architects of the Day.

No. 1. Messrs. Mewes and Davis

(Note.—In continuing an old and popular feature of "The Builders' Journal," known as the "Men who Build" series, we have adopted a more consistent and appropriate title. The old one we shall require, in the near future, for another series dealing with the work of our big contractors.—EDITOR.)

Mr. Charles Frederic Mewès was born at Strasbourg, January 30th, 1858, entered the Ecôle des Beaux Arts and became a pupil of Pascal in 1878. In 1885 he was the second *logist* chosen to compete for the *Prix de Rome*, and in the following year was given the diploma. In 1892 he was elected a member of the Société des Architectes Francais, and two years later awarded the *grande medaille* of this society for domestic architecture. He was one of the architects of the Exposition of 1900, and was chosen to design the *Palais de l'Economie Sociale et des Congrès*. Following the Exhibition he was honoured by being made Chevalier of the Legion of Honour, Chevalier of the Order of Saint Anne of Russia, and Officer of the Order of Saint Jacques of Portugal. His principal works include the Banque de Mulhouse at Belfort, Banque de Mulhouse at Colmaz, Banque Internationale of Brussels, Schweizrischer Bankverin at Zurich, Bank of Speyer and Co., at Bâle. The Orphelinat des Alsaciens-Lorrains at Vésinet (Seine et Oise), the Hotel Ritz at Paris, Hotel Ritz at Madrid (in partnership with M. de Landecho), Hotel Marie-Christina at San Sebastian (in partnership with M. de Urcola), the great "Hydro" at Contrexville (Vosges), Château of Rochfort-en-Yvelines (Seine-et-Oise), Chateau de la Chartreuse à Thoune, Château de Bois-Sallir (Mayenne), Château de Varcoucier (Mayenne), restoration of the Château de la Boissière (Siene-et-Oise). Of the great number of residences designed by Mr. Mewès, it will be sufficient to mention a few of the more important ones. His own house in the Boulevard des Invalides has always appealed to the writer as possessing one of the most charming city house fronts in Paris, and that of Mr. Charles Ferry at the corner of the Cours la Reine and Rue Bayard is a notable composition To these must be added the town houses of Mr. W. K. Vanderbilt and of the celebrated actor, Lucien Guitry, the latter a charming example of good taste and refinement, and displaying the power of reserve that comes only after vast artistic experience and as the result of much thoughtful study.

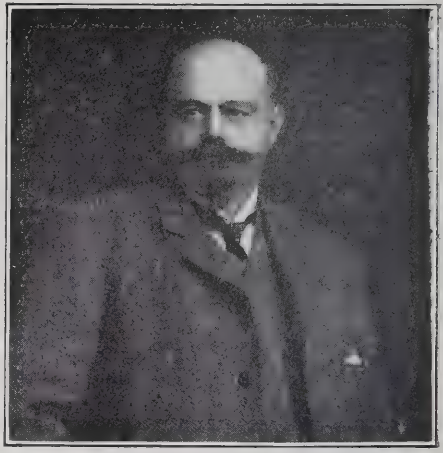

Photo: Langfier,

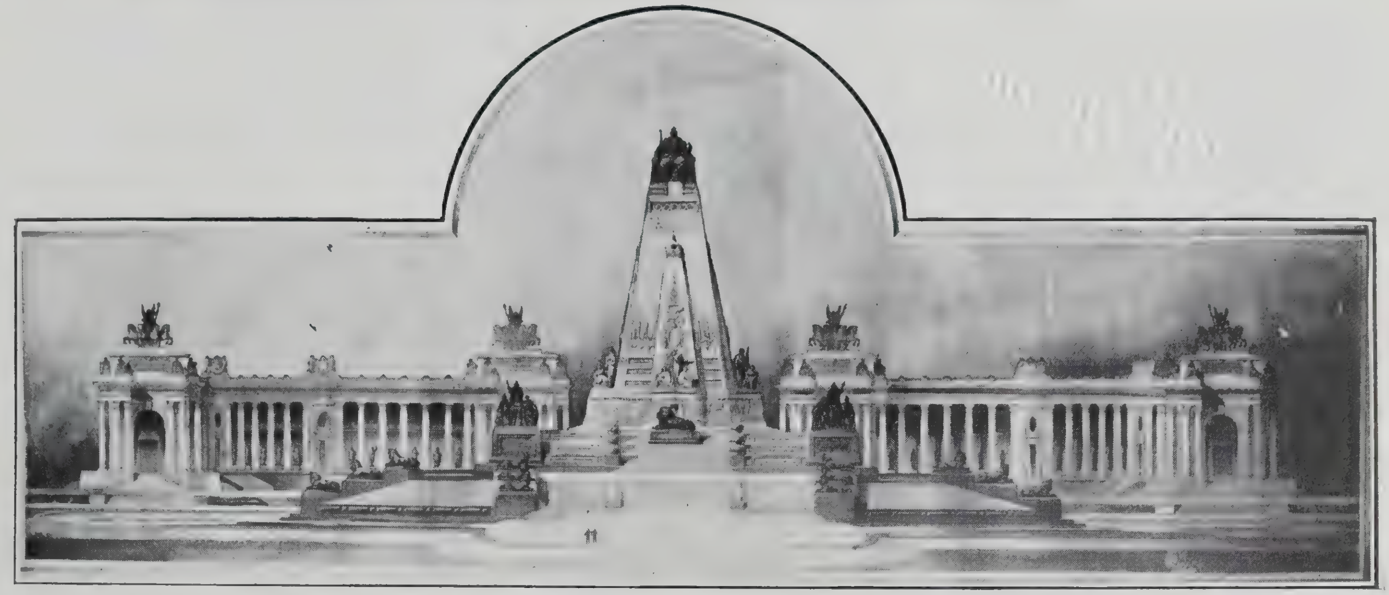
MR. CHARLES FREDERIC MEWES.

Mr. Arthur J. Davis, the junior member of the firm of Mewès and Davis, is an Englishman, born in 1878, and, his partner, a pupil of the distinguished *Membre de l'Institute*, J. L. Pascal. The partnership exists as regards work in England, of which Mr. Davis takes charge, and the number of build-



STUDY FOR A MEMORIAL TO QUEEN VICTORIA. ARTHUR J. DAVIS, ARCHITECT.

ings designed by them are among the very good things built during the last decade in this country. Their first work was the rebuilding of the interiors of the Carlton Hotel in London, and the country houses Coombe Court, Surrey, and Luton Hoo; the town houses of Mr. Gubenkian, Mr. Koch, and Mr. Spitzel, all in London; the decorations of the steamship *Amerika* for the *Hamburg-Amerika Linie*, the shop of Boucheron at the corner of Dover Street and Piccadilly, and the alterations to the Cavalry Club in Piccadilly. But the best known of their works in London are, of course, the fine buildings of the Ritz Hotel and the "Morning Post," which have been illustrated in our pages, and are well-known to readers.

More interesting than either of these, because more monumental and more classical in the influence of design, will be the new Royal Automobile Club in Pall Mall on the site of part of the group of old buildings formerly occupied by the War Offices.

It is not long since a layman wrote an article for one of the daily papers upon modern London architecture, which attracted more than the ordinary attention given by the profession as a whole to the criticisms and comments of a non-professional writing upon a subject about which so very few laymen can ever write without betraying more ignorance than information. The article to which we refer appeared in the "Daily Mail," and it "handled without gloves" a number of the recent efforts of very distinguished architects, apparently with the object of condemning artistic experiment as applied to important civic architecture, and to uphold that which is the representation of the accumulated knowledge of what is good in art, obtained as the result of centuries of such experiment. The writer seemed to assume that the comparative standard has become, as regards at least entire buildings, especially such as are built in a "style," practically an absolute one. That is to say, that without having any other building in mind, one might say of a given edifice: "This is good," or "That is bad," depending wholly upon how it conforms, not to rules which vary, but to accepted principles which do not vary. To illustrate the point, one may state the rule of the Ionic column of the Classic architecture of convention as being nine diameters in height, but we know that in special circumstances it may be as few as seven or as many as fourteen diameters and produce a satisfactory result. Thus, the column of fourteen diameters, say sixty feet high, may look well as part of a facade in a very narrow city street, and one of only seven diameters may not be bad if it is perhaps six feet high and part of a basement treatment. But the principle that in a colonnade over an arcade the columns must bear some symmetrical relation to the points of support below is invariable. Without the admission of such principles as hypotheses we cannot conclude that there is any such thing as art in architecture, and it is only by the acceptance of such principles—which are axiomatic to the discerning mind, and need but little demonstrating to convince the less acute of their truth—that architecture, or any other art, can exist as such. Now, however much we may differ from the writer of the newspaper article as regards *taste*, we can none of us fail to recognise the exceptional power of observation combined with an incisive style of telling what he saw, or the accuracy of his statements in *theory*. Whatever our predilection and prejudices, an examination of a very great deal of recent London architure could hardly fail to lead us to almost the same conclusions as those of this layman —a layman, however, especially interested in *art*. Among the things which he found admirable were mentioned, especially, the buildings of the "Morning Post" and the Ritz Hotel, both of which are modern in design, French in influence of style, refined in character, and the work of Messrs. Charles Mewès, of Paris, and Arthur Davis, of London.

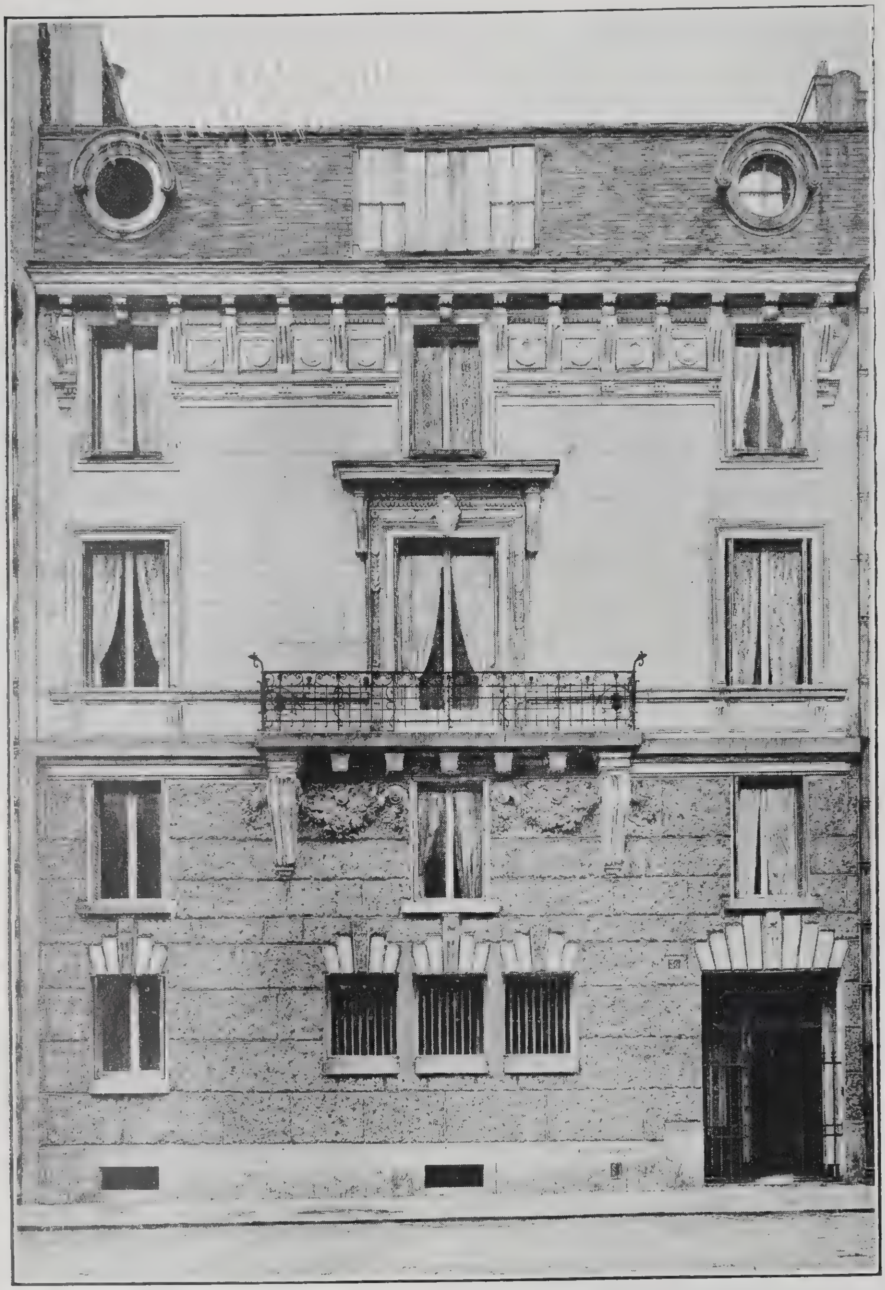
Photo: La

MR. ARTHUR J. DAVIS,

Because of their simplicity, neither the Ritz Hotel nor the "Morning Post" buildings are such as one might expect to attract the attention of either the people or an English art critic; yet they have done both, as well as achieving more than passing attention from professional architects, and have met with such general approval that there can be but little doubt that in a short time the influence of the Ecole des Beaux Arts—of which these indicate the commencement—will be as potent a factor in the architecture of England as it has been during the past fifteen years in that of the United States. So far, at least, as the monumental architecture of the country is concerned, nothing could be more welcome, with the saving clause that the best French works be allowed to serve as models, and that "Art Nouveau" and the other vagaries do not become an accompaniment.

Another example of the French influence will soon be found in Pall Mall, on a part of the site occupied by the old buildings—formerly the War Offices—between the Carlton Club and St. James's Palace grounds, in the new home of the Royal Automobile Club.

Pall Mall (though it exhibits a few aberrations) has been more fortunate than most of London's principal streets, in so far that the newer buildings have been for the most part at least the equals in design of the older structures which they have superseded. English sentiment breeds reverence for anything that is old, regardless of whether or not the object be worthy of it; which, as far as architecture is concerned, may be understood when one looks upon the good, if commonplace, old structures, and then upon the pretentious alleged "improvements"; one grasps in an instant the national antipathy to "improvements," sympathises with it, and gives the protesting public credit for at least good judgment. The old War Offices were just such commonplace old buildings, with nothing remarkable about them—only plain—not particularly refined, just inoffensive, and the improvement will be a real one. The Royal Automobile Club is to be built from the designs of Messrs. Mewès and Davis, architects, with whom is associated Mr. E. Keynes Purchase, the honorary architect of the club. Few modern buildings afford such opportunities for the display of an architect's abilities as does a club-house, for which there are many obvious reasons. There is, for instance, no opposition party demanding an investigation of every penny spent upon those details and materials which come beyond the range of "rigid economy," usually the bane of the architect's existence when he is working upon the plans of a building that is to be erected from funds gathered by the tax collector. Neither is there the trouble of educating the client from "Victorian Gothic" to sobriety, nor the diplomatic labour necessary to convince his clients' female relations that his design cannot be materially improved upon—and cheapened at the same time—by adopting all of the suggestions set forth in the architec-



MR. MEWES' HOUSE, BOULEVARD DES INVALIDES, PARIS: ERECTED FROM HIS OWN DESIGNS.

tural (?) section of some newspaper for ladies, which are sometimes brought to bear against his ideas as to domestic work. Perhaps most fortunate of all is the fact that this is in no sense a commercial structure. An important social club—especially an Automobile Club—implies a certain assumption of the wealth of its members, but differs from an expensive hotel, in that its object, avowedly at least, is not primarily to make money; and, therefore, it need not vie with its neighbours in pretensions to luxuriousness for the sake of the advertisement entailed. Besides, a degree of intelligence may be expected of the members of its committee not so likely to be found in those charged with the erection of public or ecclesiastical or commercial structures. The club committee are less likely, either, to leave the architect without information as to what is required, or to goad and hamper him with unreasonable conditions and restrictions. A member of such a committee could never be selected from the ranks of resolute busybodies, even if by some mischance such had been admitted to membership. Hence obstructive interference or excessive individuality is improbable of intrusion upon the domain of the architect, and he is left with an almost ideal problem to solve. He is given the site, the approximate number and kind of rooms for reception and entertainment, for accommodation of members, and for service. The engineering detail, if more complex, may be less in evidence than is usually necessary in other large buildings. Participating at once in the nature of the domestic and public building, it is the least of each and the highest type of both—the ideal of practical socialism; the home of good form and refinement; the child of precedent. Personality, if not discountenanced, is at least undesired; and extraordinary originality, especially if it leans to eccentricity, is *not* clubable. The character of its architecture must be dignified, the style correct, and the individual element in design which makes a home charming to one person and unbearable to another should be eliminated from consideration. Impersonal, if not strictly monumental, architecture has been the rule for the best clubs of the West End, high Renaissance being the type of design which has prevailed in Pall Mall. Of the clubs extending from Waterloo Place to St. James's Palace (which includes the Athenæum, Travellers', Reform, Army and Navy, and Carlton), the facade of the Travellers' is based upon the design of the Pandolfini Palace in Florence, and that of the Carlton upon the Library at Venice, and the Reform and Army and Navy, upon places at Rome and Venice. The Royal Automobile Club, which will adjoin the Carlton, follows the precedent more or less adopted by the other clubs, and owes its inspiration to the former Hotel Crillon-Coislin—now the Automobile Club—in the Place de la Concorde, Paris. It would be difficult to find a more beautifully studied example of modern architecture than the fine fronts by Gabriel facing the Place de la Concorde—there are two buildings, exactly alike, the former Hotel Crillon-Coislin and the Ministere de la Marine—second only to Perrault's colonnade of the Louvre, if, indeed, to that. This is amongst the finest columnar facades in the world. It is extremely improbable that any Classic design to equal this will be built in England during the lifetime of anyone now living, so that any architect who would emulate Gabriel must needs do so in much the same spirit that he might attempt to emulate the Parthenon or the Sainte-Chapelle to attain as near as the conditions permit the same character of refinement, simplicity, and strength.

This character is expressed to an unusual degree in the design for the new Royal Automobile Club. It is large in scale, an essential to monumental effect; the proportions of the *travée* are nearly the same in elevation as those of the buildings by Gabriel, but the effect will be quite different in perspective, due to the column being engaged instead of part of a free screen. Again, in elevation, the central feature of the new building is similar to the end pavilions of the old; but the effect here will also be different. In the French example the corner columns under the pediments are engaged to the pylons, and the two middle ones, though free, are only a half diameter from the pilaster behind. In the building to be erected in Pall Mall, the corner columns will be a half diameter in front of a pilaster on the corner of the pylon against which the portico returns, while the middle ones are in screen, due to the wall face being recessed below the pediment to form a loggia. This latter effect is usually a weak one, giving, as a rule, the impression of two buildings joined together; but the present treatment with the pylons at the ends, and those at either side of the pediment brought to the same face, slightly in front of the bases of the columns, and the mass of masonry forming an attic behind the pediment, projecting beyond the face of the pylons, will produce the effect of a strong frame of masonry round the void in the centre, and will appear effectually to unify the whole front.

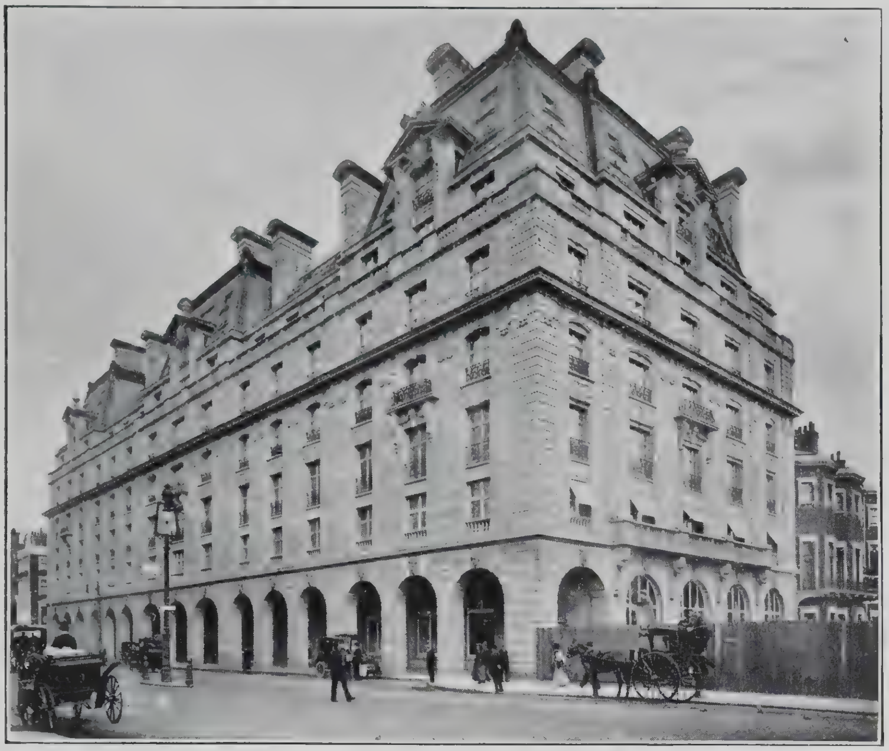
Internally, the building is treated in the "grand manner." There is an uninterrupted vista from the Pall Mall entrance through to Carlton House Terrace. The elliptical vestibule is 48ft. by 32ft., and runs through two storeys, and is 50ft. high to the ceiling over the central portion. The dining-room at the east end, and the club room at the west, are each 93ft. by 35ft., and the "lounge," which on occasions may be used as a lecture-room, is 108ft. by 40ft., including the platform, and 35ft. high. The basement contains a gymnasium and extensive baths, which are accommodated in rooms 28ft. high. Included in the baths is a swimming pool 30ft. by 75ft.

The Royal Automobile Club will be the first important club building built in London for several years. As architecture, it bids fair to rank high among the best work of this century in England.

Next week we shall give further particulars and illustrations of work by this firm.

(*To be concluded.*)

Messrs. Richard Moreland and Son, Ltd., give notice that they have removed their engineering works from Old Street to Silvertown. Their general offices will still remain at 80, Goswell Road, London, E.C



THE RITZ HOTEL, PICCADILLY, LONDON.
MEWES AND DAVIS, ARCHITECTS.

BRITISH SCULPTURE OF TO-DAY.

At an ordinary general meeting of the Royal Institute of British Architects, Mr. M. H. Spielmann, F.S.A., delivered an interesting lecture upon "British Sculpture of to-day." Having observed that, in justice to himself, he would like to explain that the present paper was an attempt to compress three lectures into one, Mr. Spielmann said that his object was not primarily to deal philosophically with the theory of sculpture. For the short space of time at his disposal he would like to summarise as concisely as possible the progress of British sculpture during the last thirty years.

Since 1875, a great change had come over the art in England; and, to-day, the British school found itself upon a level that thirty years ago was quite unhoped for. The followers of this, perhaps the most unappreciated art, had no tradition upon which to base their own work; but they had for leaders such splendid men as Frederick Leighton, Alfred Gilbert, and Onslow Ford.

Going back for about sixty years, it was interesting to observe the curious method then employed of commemorating the careers of great personages, and establishing their fame for all time. For many people it was a matter for continual speculation why the Admiral should be "mast-headed" in such a mortifying way in Trafalgar Square. Again, few could properly appreciate the wisdom of placing an effigy of the Duke of York upon a lofty column, and striking through his brain a lightning conductor. True, some had gone so far as to suggest that the latter could be used most appropriately for the purpose of filing the Duke's many undischarged accounts; but this, to say the least, was an invidious proposition. It had been remarked, in regard to the equestrian statue of George the Third in Trafalgar Square, that "never was there so drunken a horse with so sober a rider." The story of this statue was a curious one; for few were aware that it was originally a representation of St. George and the Dragon. The dragon was not considered an indispensable accessory, however, so it had been removed; and there they had at once a memorial quite befitting the noble monarch. Thackeray had once taken a French acquaintance to see it. After gazing at it for a few moments in silence, the Frenchman exclaimed, "Waterloo is avenged!"

How utterly deficient in the quality of appreciation of all pertaining to art the British public were, was common knowledge. Ignorance was the monopoly of no particular class, however, and it was notably pronounced in the official section of the community where one would least expect to find it. Bad taste was everywhere observable; and, for excelling in this respect, committees which commissioned statues manifested an unusual aptitude. Above all, it was most desirable to remember that nothing should be done which might tend to disturb the delicate imagination of the artist; for sculpture, like its sister art architecture, was a subject of harmony and of science.

The present aim of the modern school was to impart life without any undue straining after realism. It was, perhaps, not very surprising that sculpture was misunderstood in England. The eye was more easily attracted by colour than by form, and this was the chief argument to be advanced to account for the apparent ineffectiveness of sculpture. It was not an imitative art, but an expression of design and form without colour, atmosphere, or tone. In this respect the painter possessed a great advantage over the sculptor. Whereas the former could adapt his brush practically to any subject, the latter was more restricted and his scope more confined.

The work of Alfred Stevens was a revelation, and it included some of the finest of

which the British school could boast. He was a man who, it might be almost said, possessed the power to instil life into lifeless clay. Although a follower of Michelangelo, Stevens was no copyist. His work was original throughout, and had quite a distinctive character of its own. A great deal of his success was, beyond doubt, attributable to his sound knowledge of construction and of architecture. Very few people were aware of the existence of one of Stevens's most remarkable designs. He referred to the feet of the refreshment tables at the South Kensington Museum; and all who could should avail themselves of the first opportunity for examining them. Any time thus devoted could not possibly be wasted, as the knowledge gained would amply compensate the outlay.

Slides of the works of many famous modern British sculptors were thrown upon the screen, the lecturer describing and criticising both lucidly and sympathetically each example as it was shown.

Chief among the eminent sculptors dealt with were the following:—Alfred Stevens, John Foley, H. H. Armstead, George Lawson, T. Brock, Frederick Leighton, Sir Charles B. Lawes, Hamo Thornycroft, H. Thomas, Onslow Ford, John Swann, Alfred Gilbert, Harry Bates, Sir George Frampton, Henry Pegram, Alfred Drury, Pomeroy, Albert Tofts, Goscombe John, Bertram Mackennal, W. Colton, David McGill, Derwent Wood, and Albert Hodge.

Discussion.

Mr. Goscombe John, R.A., in proposing a vote of thanks to Mr. Spielmann, observed that it was a very great delight to them all to listen to so uncommon a thing as a lecture upon sculpture. With his exceptional knowledge of the subject, Mr. Spielmann was pre-eminently competent to deliver such a lecture. Of all the arts, sculpture appeared to have most difficulties to contend with, from the point of view of public recognition and appreciation. Truly, the technical side held more perplexities to the outsider; but it was impossible to estimate the exact result of pure technique and of sentiment.

Mr. W. Colton, in seconding the vote of thanks, said that the English were a diffident race, and sculpture had never before stood in such need of capable spokesmen as it did to-day. He felt that Mr. Spielmann was the only really able spokesman they had; for he loved sculpture for sculpture's sake. There was a decided tendency to mutilate sculpture; and it was more particularly observable at exhibitions, where this destructive inclination was allowed to run riot. Concluding, the speaker firmly believed that if sculpture was to succeed, it must be criticised in a friendly spirit.

Mr. H. H. Statham, in supporting the vote of thanks, observed that he was old enough to remember the long rows of busts of no particular merit, which, in days gone by, could be seen at the Royal Academy. Great improvement was being made, however, and work of a really praiseworthy character had now displaced the old ineptitudes. He was afraid that sculpture could never be a very popular art. It seemed to him that the great object of sculpture was to express an abstract thought in an abstract way. In regard to dress, he was of the opinion that delicate folds of drapery lent themselves to more satisfactory treatment in bronze than in marble. It struck him that the manner in which the French surmounted difficulties in regard to monuments was both commendable and desirable. The whole figure was not given, but merely a medallion of the head; the various subsidiary figures being placed around. To one work of Gilbert's, Mr. Spielmann had not referred. He believed it was called "The Dream," but of this he was somewhat uncertain. It comprised the nude figure of a woman seated in an antique chair, while round her head hovered an angel. He believed the conception had never got beyond the stage of a clay model; but it was a remarkable work, and a photograph which he possessed he dearly prized.

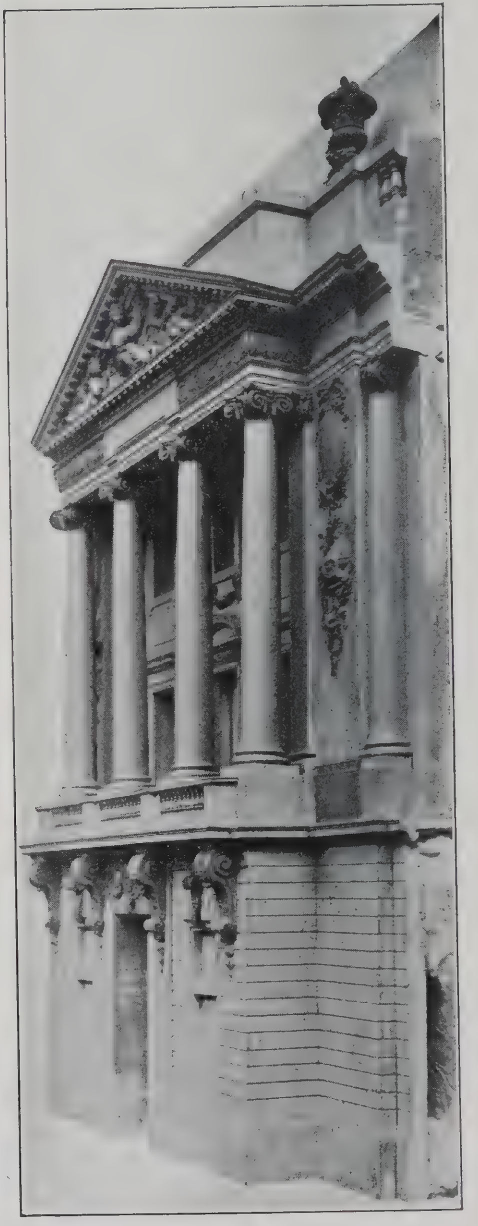
Mr. Ernest George said they were all deeply indebted to Mr. Spielmann for his most interesting lecture.

Mr. Spielmann, responding to the vote of thanks, said, regarding Mr. Statham's reference to the work of Gilbert, he believed that the correct title was "The Magic Charm." Gilbert had never considered it worthy of himself and had destroyed it.

ANCIENT BUILDINGS AND MODERN ARCHITECTURE.

Mr. Thackeray Turner, F.S.A., lecturing at the Carpenters' Hall on "Ancient Buildings and their effect on Modern Architecture," said that the thought that ran through his paper was the question of copying. Man's nature being of two sorts—animal and spiritual—the arts chiefly denote the spiritual element.

A man can go through the world ignorant of the arts of music, painting, etc., but he



A PRELIMINARY STUDY FOR THE ROYAL AUTOMOBILE CLUB, PALL MALL.

REVISED STUDY FOR ROYAL AUTOMOBILE CLUB, PALL MALL. LONDON. MEWES AND DAVIS, ARCHITECTS.

cannot avoid architecture. No matter whether in the country or in the town, he cannot help seeing the house of God, and the house of man. There can be no doubt of the great influences of our surroundings; and it therefore seems absolutely necessary that we should admit the great importance of all buildings affecting man. If the building is good, it will do good, but if bad, then assuredly it will do harm. How great a responsibility then lies on the architect! But a great responsibility also rests on the layman. The architect can do a great deal; he has the whip hand, but he has to conform to public opinion.

If we have a wide knowledge of the architecture of our country, we must have noticed one remarkable characteristic of the Mediæval buildings, whether cathedral, cottage, farm-house, or manor-house, they all beautify the face of nature. Now, ninety-nine out of a hundred buildings that are put up disfigure the town or country, and are an eyesore.

In considering the effect of old buildings on modern architecture, it cannot be too clearly understood that an archæologist is not an architect. A man, if he is a good archæologist, is apt to be a bad architect. About the middle of the 18th century, when the Renaissance was in its last gasps, the romantic qualities of Mediæval architecture began slowly to gain a hold on the nation. The Gothic revival coincided with the revival of the Established Church, and many people to day look upon Gothic architecture as purely ecclesiastical work. The Gothic revivalists, however, sought to see every building in one style.

In building, nowadays, we cannot avoid the mechanical nature of the work done by our men. This is no fault of their own, for they are little better than machines; and if we bear this in mind, opportunities may arise of mitigating it. One of the fundamental ideas of the restorers was, that if we had a beautiful building, we had only to make copies and our new buildings would be beautiful. We cannot, however, have a work of art without creation. The question of copying is, in the lecturer's opinion, the key to the question of how we are to approach modern architecture. If a building is designed in 13th or 14th century style, the beholder will unconsciously have his mind taken back to that period, and mentally compare it with the past. He knew of no building that would bear the comparison.

One of the most striking facts about modern architecture is that no two buildings are alike. He need not say how we build now. We all know only too well the rows of hundreds of houses all built from the same plans. Now-a-days, one man thinks for hundreds of workmen.

Comparing our modern methods with those of the Mediæval builders, Mr. Turner remarked that with us symmetry is an essential. Not so with them; they paid no attention to accuracy; but we cry out if a wall is one inch out of the straight. The modern bricklayer takes care that all the brickwork is of the same colour, and that the bricks of every other course come over one another. In Mediæval brickwork we find just the opposite.

The "restoring" architect, when he has an ancient building placed in his hands, thinks how he can improve it. The "repairing" architect seeks to preserve its truths. Any man who devotes his energy to repairing ancient buildings properly will become a good builder. An architect's duty in planning a new building is (1) to plan it to suit its purpose, and (2) to study the construction carefully, so that it may last, and see that the weights are distributed according to the foundations; but he must at the same time bear in mind that his building must make a pleasing block. If he does this successfully, the result will be fine architecture, although there is not a single ornament on his building. It is only when decorative features are copied that the question of style comes in.

It is often said that you cannot invent a new style. Few things are more offensive than a striving after novelty. Probably building materials are of more importance than anything else in architecture; yet, strange to say, they seem to have received less thought and care than any other side of the question. If ancient buildings were properly studied, it would be seen how much they depend on construction, the right use of materials, and, in Mediæval buildings, their lack of symmetry. The old builders did not have one man who ordered the carrying out of the whole building down to the smallest detail; and no one knew who built the fine buildings of old days, but every workman knew his part. We may say: How can we do without the architect? One thing the architect can do is to use the brains of other people. He should try to inspire others, and get artists to do good work for him. It is not reasonable that one brain should do all the thinking.

Conditions and site plan, from B. Burfield, Clerk to the Guardians, Parochial Offices, Prince's Street. Brighton.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading, Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second, and third respectively. Assessor: Mervyn E. Macartney, F.R.I.B.A., F.S.A.
July 31.	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	BOURNEMOUTH BRANCH PUBLIC LIBRARY. Architects practising in the County Borough of Bournemouth are invited to submit designs for a new Branch Library at Boscombe. Particulars from Charles Riddle, Borough Librarian, Central Library, Bournemouth.
No date.	WALLASEY U. D. COUNCIL. CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

The Court of Common Council (London) have adopted the report of the Officers and Clerks Committee recommending that the maximum salaries of the women sanitary inspectors should be increased to £200 per annum, to be reached by annual increments of £10. It was further decided that the salary of the third woman inspector should begin at £120 per annum, and rise by annual increments of £10 to the maximum of £200.

* * *

At a meeting of the Winchester City Council, an offer was considered from the Dean and Chapter of Winchester Cathedral to present to the city the stone screen designed and erected in the reign of Charles I at the entrance to the choir of the Cathedral by Inigo Jones. This screen was removed in 1820 to make way for a stone Gothic screen. Inigo Jones's work was stored in the triforium of the south transept, from which it was recently removed owing to its great weight, which added danger to that part of the building. The Council accepted the gift, and will shortly proceed to consider its re-erection on public property.

* * *

Messrs. Henry Adams and Son, of 60, Queen Victoria Street, E.C., have been appointed consulting engineers to the Committee for the proposed bridge over the river Wey, at Guildford, for which Messrs. Clemence and Moon's design was accepted out of seventy-five sets submitted, and under whose superintendence it will be erected.

THE INSTITUTE MEMBERS' CLUB.

A meeting of the above will be held in the Smoking-room of the R.I.B.A., to-morrow, Thursday, April 22nd, at 6 p.m.

THE GUILD OF ARCHITECTS' ASSISTANTS.

The Council has issued a manifesto of the objects of the new Guild, which are set forth as follows:—

1. The consideration and settlement of all questions relating to the interests of Architects' Assistants.
2. To secure a recognised scale of salaries for Architects' Assistants.
3. To organise an employment bureau, and a system of unemployed insurance.
4. To promote the formation of a Federal Council, consisting of representatives of existing Architectural Societies in the United Kingdom, to deal with all questions connected with the profession.
5. To co-operate with existing Societies for the protection of the profession.

The proposed annual subscription is half-a-guinea. All information required will be given by the Secretary, 60, Idmiston Road, Stratford, London, E.

Upon the instructions of Mr. Watts-Dunton, Mr. J. Drury, sculptor, Chelsea, has prepared a plaster cast of the late Mr. Algernon Charles Swinburne's features preparatory to executing a marble bust.

* * *

Mr. Gordon L. Wright has removed to No. 30, Frederick Street, Edinburgh, from 122, George Street, Edinburgh. The telephone number remains the same—4007 Central.

* * *

Mr. Vere Sussex Hyde, of Kew, Surrey, son of Mr. R. Singer Hyde, M.S.A., senior partner of Messrs. Singer Hyde and Son, architects, of Worthing, has commenced an architectural practice at 11, Defoe Avenue, Kew Gardens. Mr. Hyde has been specialising in the science of fire-protection, and the design of fire-resisting buildings, and has had a varied experience in warehouse, factory, and domestic work.

* * *

We have received from the Adjustable Shelving and Metal Construction Co., Ltd., of Gwydir Chambers, 104, High Holborn, W.C., a copy of their new illustrated catalogue setting forth an entirely new system of internal construction for libraries, warehouses, etc., and describing their space-saving fittings for all buildings where books, documents, or goods are to be stored. The chief advantages claimed for the system are: the easy and rapid adjustability of the loaded shelves, effected by an ingenious non-mechanical device; the interchangeability of all parts; the great saving of space which it effects; its fire-resisting character; and the low price in comparison with other systems. It is stated that a large number of buildings have already been erected and installed on this system, not only on the Continent of Europe, but also in America. The illustrations with which the catalogue abounds show very clearly all the details of the system.

Rex Flintkote Roofing, of which samples have been forwarded to us for examination, has for its base what is the best known non-conductor of temperature, namely, wool felt. The process of manufacture is succinctly described. The felt, having been thoroughly saturated with a "binder" which is proof against acid, alkali, and water, and is unaffected by steam or gases, is subjected to enormous pressure, making a tough, pliable sheet of close texture. The sheet is then coated on both sides with the firm's special compound and with the flint coating which is so valuable a feature of the material, which thus presents a surface as hard as flint on a perfectly elastic non-conducting base. The flint coating is obviously a very valuable feature, preventing the material from sticking together in the rolls, assisting materially in insulation, and forming a minute air-space between the roofing material and the boards, thus preventing dry rot. The material is of very light weight, and is thus applicable to buildings with slender roof supports, or to buildings that have become weakened by age. The samples are of four different thicknesses. The London agents are Messrs. Elliesen and Michaelis, [illegible], Aldermanbury, E.C.

SOME NOTES ON THE EXHIBITION AND ITS VALUE.

THE OUTCOME OF AN IDEA.

BY H. GREVILLE MONTGOMERY, M.P.

The present Building Trades Exhibition is the outcome of an idea. Some fifteen years ago I exhibited at the then Building Trades Exhibition at the Royal Agricultural Hall, Islington, some specimens of clays and bricks from different parts of the country, I took the opportunity of making a suggestion to the promoter of the Exhibition as to how it should be conducted to ensure success. My suggestion was readily adopted, and this was followed up by an offer to become partner in the exhibition. This I accepted, but my prospective partner failed me, and I was requested to take over the whole responsibility, which I promptly did. Then began the slow and wearisome business of weeding out undesirable would-be exhibitors. I formed a Consultative Council of Architects, with the late Professor Banister Fletcher as chairman, and immediately put the exhibition upon a sound footing. I made a firm rule that no exhibit unless pertaining to the building trades should be admitted, and this produced execrations from shooting gallery proprietors, optical lens dealers, watch makers, sweet-stuff sellers, and such like, who had hitherto reaped a fat harvest from the *élite* of Islington. Men used to come into the office and dangle sovereigns before one's eyes in the hope that the sight of gold might tempt one to relent, but it was of no avail, however.

Photo: Bassano.

MR. H. GREVILLE MONTGOMERY, M.P.

I think I may safely say that there is no trade exhibition held in this or any other country that is so extensive, complete, and exclusive as the present one at Olympia. If these shows have done nothing else they have stimulated the desire for things beautiful in the public mind, for whereas in past years the architect used to build houses without scarcely consulting his client, there is a tendency more and more for the client to suggest to the architect. Further, an exhibition of this kind directly induces an interest in building, and there are few who come to Olympia, and possess even moderate means, who go away without ordering some article for decorating or beautifying the home. But the man whom the exhibitor loves most is the architect himself, who deals in quantities. That exhibitions of this kind are of real value to the professional man has been proved over and over again, for he can see in the course of one or two visits what would take him months to accomplish were he to travel the country in search of new and up-to-date ideas. Again, he can inspect the material as it appears in an actual building, which is a very different thing to being provided with a sample, and what perhaps is of most importance, when an architect comes to an exhibition of this kind, he comes with the determination to talk business, and he comes to the manufacturer instead of the manufacturer waiting for an opportunity (often long delayed) of bearding the architect in his official den.

I could not have accomplished what I have in regard to this exhibition had I not been helped by my brother, Mr. Hugh Montgomery, who, from the beginning has re-

Photo: R. Thiele.

MR. H. C. MONTGOMERY.

lieved me from the more commercial side of the work of organisation. As to when and how these exhibitions will end, nobody knows; they seem to have no finality, and every succeeding one is better than the last, both in the variety of the exhibit and in the lavishness of its construction.

"OF ADVANTAGE TO ARCHITECTS."

BY R. FRANK ATKINSON, F.R.I.B.A.

I consider that an exhibition of this high-class character, when most of the manufacturers do their best to show to the best advantage what they are capable of producing, cannot but be of advantage to architects and all interested in building, as it brings before them in a concise form what it would take weeks or months in travel to ascertain when scattered in various show rooms and buildings, and it is especially advantageous to show the materials in a completely finished building, as is shown in many instances.

"THE VALUE CAN HARDLY BE OVER-ESTIMATED."

BY A. W. S. CROSS, M.A., F.R.I.B.A.

The present exhibition at Olympia promises to be a great success, and this despite the fact that it can, necessarily, only appeal for the support of a comparatively small portion of the community.

But to those whose avocations bring them within the boundaries of the ever-broadening sphere of influence of the building trade, the forthcoming exhibition will be, we believe, one of paramount importance. Thus to the architect engaged in the active practice of his profession—to the building trade specialist and manufacturer—and to that section of the public which may be, for the moment, especially interested in building materials, and new or improved methods of building, this year's exhibition will undoubtedly present features of great interest.

The value to the architect of well organised and arranged *representative* building trades exhibitions which alone will enable him to keep himself thoroughly *au courant* with the various specialities and novelties connected with the practical requirements of his profession, can hardly be overestimated.

A short time spent at an exhibition in the personal examination of a few of the novelties which have probably been already brought under his notice by means of circulars or advertisements in the professional journals, will often enable the experienced practitioner to form a perfectly reliable estimate of their intrinsic worth. Thus building trade exhibitions are undoubtedly of considerable assistance to architects in enabling them to exercise their judgment on the merits of specialities to which their attention has been directed by means of more or less attractively worded advertisements which, in themselves, are not always quite convincing to those rendered somewhat sceptical by past experience. Many of the successful inventions emanating from the building trade fraternity owe much of their commercial success to favourable opinions passed upon them by architect visitors at public exhibitions, and so, naturally enough, manufacturers of building specialities are usually enthusiastic supporters of building trades exhibitions, which enable them to bring the merits of the specialities in which they are interested under the immediate notice of their best customers, viz., the members of the architectural profession. Indeed, such exhibitions often become the medium for an informal exchange of ideas between the architect and manufacturer, which rarely prove entirely profitless on subjects with which their mutual interests are closely concerned.

To the public at large these exhibitions might not be expected to appeal. Yet, as most men at some period of their lives are directly or indirectly interested in building projects, many of the public are to be found on occasions congregated in the vicinity of (from their point of view) the more attractive of the exhibitors' stalls. And if even a small percentage of these casual spectators are thus led to take a greater interest in building methods and building materials nothing but good can result both to the architectural profession, to the manufacturing specialists, and to the community at large.

"OF THE GREATEST POSSIBLE VALUE."

BY ALFRED EAST, R.A.

I think such exhibitions are of the greatest possible value and advantage, not only to the trades intimately associated, but to the general public. They stimulate the interest which the public ought to take in such matters, in questions of sanitation, heating, lighting, and ventilation, which are of so much importance. These exhibitions, I should say, will greatly further the advance which has already been made, and, I think, particularly in the matter I have named, for at Olympia the public can see demonstrated different systems and can form for themselves some idea of the principles they express. The Exhibition must be good, also, for the builders and for the same reason. They see these demonstrations which they might find difficult and too expensive to carry out, as experiments themselves.

"THE MOST USEFUL KIND OF EXHIBITION POSSIBLE."

BY MERVYN E. MACARTNEY, B.A., F.R.I.B.A., F.S.A.

On the poster advertising the exhibition you will find written the words, "The House Beautiful." Is this prophetic? At the very lowest, however, such an exhibition tends to the house useful, sanitary, well-built, and stable. Beauty may be allowed to roam outside a little longer—it will be caught eventually. On one thing we are agreed, that whatever outward pleasantness our buildings possess, they shall be well-built to outlast the years, and within they shall possess conveniences, such as fireplaces that do not require a mine to replenish them, hot water

Photo: Topical.

MR. ERNEST GEORGE DECLARING THE EXHIBITION OPEN.

apparatus that heat, floors that withstand the wear and tear of many feet, waterworks that do not rattle like all Bedlam let loose. Here will be found contrivances to obviate these and many greater inconveniences.

To the architect, first of all, this exhibition is addressed to keep him in touch with the improvements being made in all pertaining to the equipment of the house, to give him knowledge of new materials for walls, floors, roofs, etc. It is indeed to the architect the most useful kind of exhibition possible to conceive, allowing him to garner in an inconceivably short space of time information that could be got in no other way except at the expense of a great deal of time.

To a wider public, however, than architects, this exhibition will make advances. Builders themselves will find much to interest them—improvements in plant, new methods of building, reinforced concrete with its labyrinthic network of iron bars, wires, knots, and so on, patent bricks and stones. "The old order changeth," and he is the wise man who is in the van with his shield quartered and charged with multifarious improvements. Engineers and inventors will not find it a dull show, for their work will make a formidable exhibit, full of ideas and pregnant with suggestions for the future. The great general public will be interested. Labour-saving apparatus and devices of all kinds to please the fastidious in matters of comfort and utility will make a direct appeal. All these voracious and diverse appetites will find an eleemosynary feast, not the kind of meal sparingly distributed at an "ordinary," but the sumptuous profuseness of a city banquet.

"OF GREAT USE TO ARCHITECTS."

BY SIR ASTON WEBB, R.A., F.R.I.B.A.

I have no hesitation in saying that I think it is an exhibition of great use to architects. At the present day, when there are so many novel forms of construction and new methods in fittings of all sorts, it is of great use to see them collected together, and to be able to compare their respective merits without going long distances for the purpose.

THE OPENING CEREMONY AND LUNCHEON.

A distinguished company assembled at the exhibition on Saturday last for the opening ceremony, by Mr. Ernest George, President R.I.B.A., including Sir George Frampton, R.A., Sir William Richmond, R.A., Sir Henry Tanner, I.S.O., Sir A. Brumwell Thomas, Messrs. J. W. Simpson, Walter Cave, John Slater, Ernest Newton, A. W. S. Cross, William Flockhart; W. E. Riley, Mervyn Macartney, R. Frank Atkinson, Alfred Yeates, W. H. Seth-Smith, Arthur Keen, George Hubbard, G. H. Fellowes-Prynne, Sydney Perks, Louis Ambler, Edwin Quinn, F. Dare Clapham, A. H. Ryan-Tenison, Edwin O. Sachs, Ernest J. Brown (President National Federation of Building Trades Employers), A. G. White (Secretary of National Federation), and many others. After a short tour of the main hall, a halt was made at the "Emdeca" stand, from the steps of which Mr. George declared the exhibition open in a short sentence or two:—"I have had the pleasure of walking round this very excellent exhibition, and I have been greatly impressed by observing from the many stands a very useful collection of materials and appliances which cannot fail to be of the utmost use to those engaged in the building profession. I congratulate Mr. Montgomery upon the success of his efforts, and I declare the exhibition open." (Cheers.)

The band of the Legion of Frontiersmen having played the National Anthem, the company adjourned to the Pillar Hall for luncheon, Mr. H. Greville Montgomery presiding.

The chairman proposed the first toast, that of "The King." "Gentlemen," he said, "I ask you to drink to the health of the King, whom we are always glad to honour at any time and in any place." (Hear, hear.) The toast was accorded musical honours.

The Chairman next proposed "The Health of the Prince and Princess of Wales." "I now ask you," he said, "to drink to the health of the Prince and Princess of Wales. Their Royal Highnesses were good enough to pay a visit to this exhibition two years ago, and I am glad to be able to announce to day that they have promised to pay us another visit before this exhibition closes." (Cheers.)

"The Health of Mr. Ernest George, president of the Royal Institute of British Architects," was then proposed, and the Chairman, in doing so, said: "Gentlemen, I am going to ask you to be kind enough to drink to the health of Mr. Ernest George, president of the Royal Institute of British Architects. (Cheers.) He has been so kind as to come here to-day to formally open our exhibition, and we most heartily welcome him among us. To know him is to like him. (Hear, hear.) We are glad to see him looking so bronzed and well after his recent holiday, which has been somewhat curtailed by him in order that he might be here among us to-day. (Cheers.) With a view of getting a little inspiration for the arduous duties which devolve upon him to-day, he has been paying a visit to ancient Venice, and I can assure him, many a time during the past week, when I have been in this hall, early in the morning and late at night, sometimes suffering from cold, sometimes from sweltering heat, and always having to 'boost' up the 'slackers'—standing over them with a stick in order to get their stands ready in time—I have pictured Mr. Ernest George in Venice sitting in St. Mark's Square, feeding the pigeons—(laughter)—and watching the slow rise of the stately Campanile, or perhaps cracking a bottle at Florio's, and talking to his friends about the glories of Venice, or the tragedy of Messina, while we have been putting our few sticks and stones together in this building. Perhaps then, he thought of the beautiful lines of Omar Khayyam:—

> 'Ah, fill the cup; what boots it to repeat
> How Time is slipping underneath our feet,
> Unborn to-morrow, and dead yesterday;
> Why fret about them if to-day be sweet?'

I now ask you to fill the cup and drink to our kind philosopher and friend, Mr. Ernest George." (Cheers.)

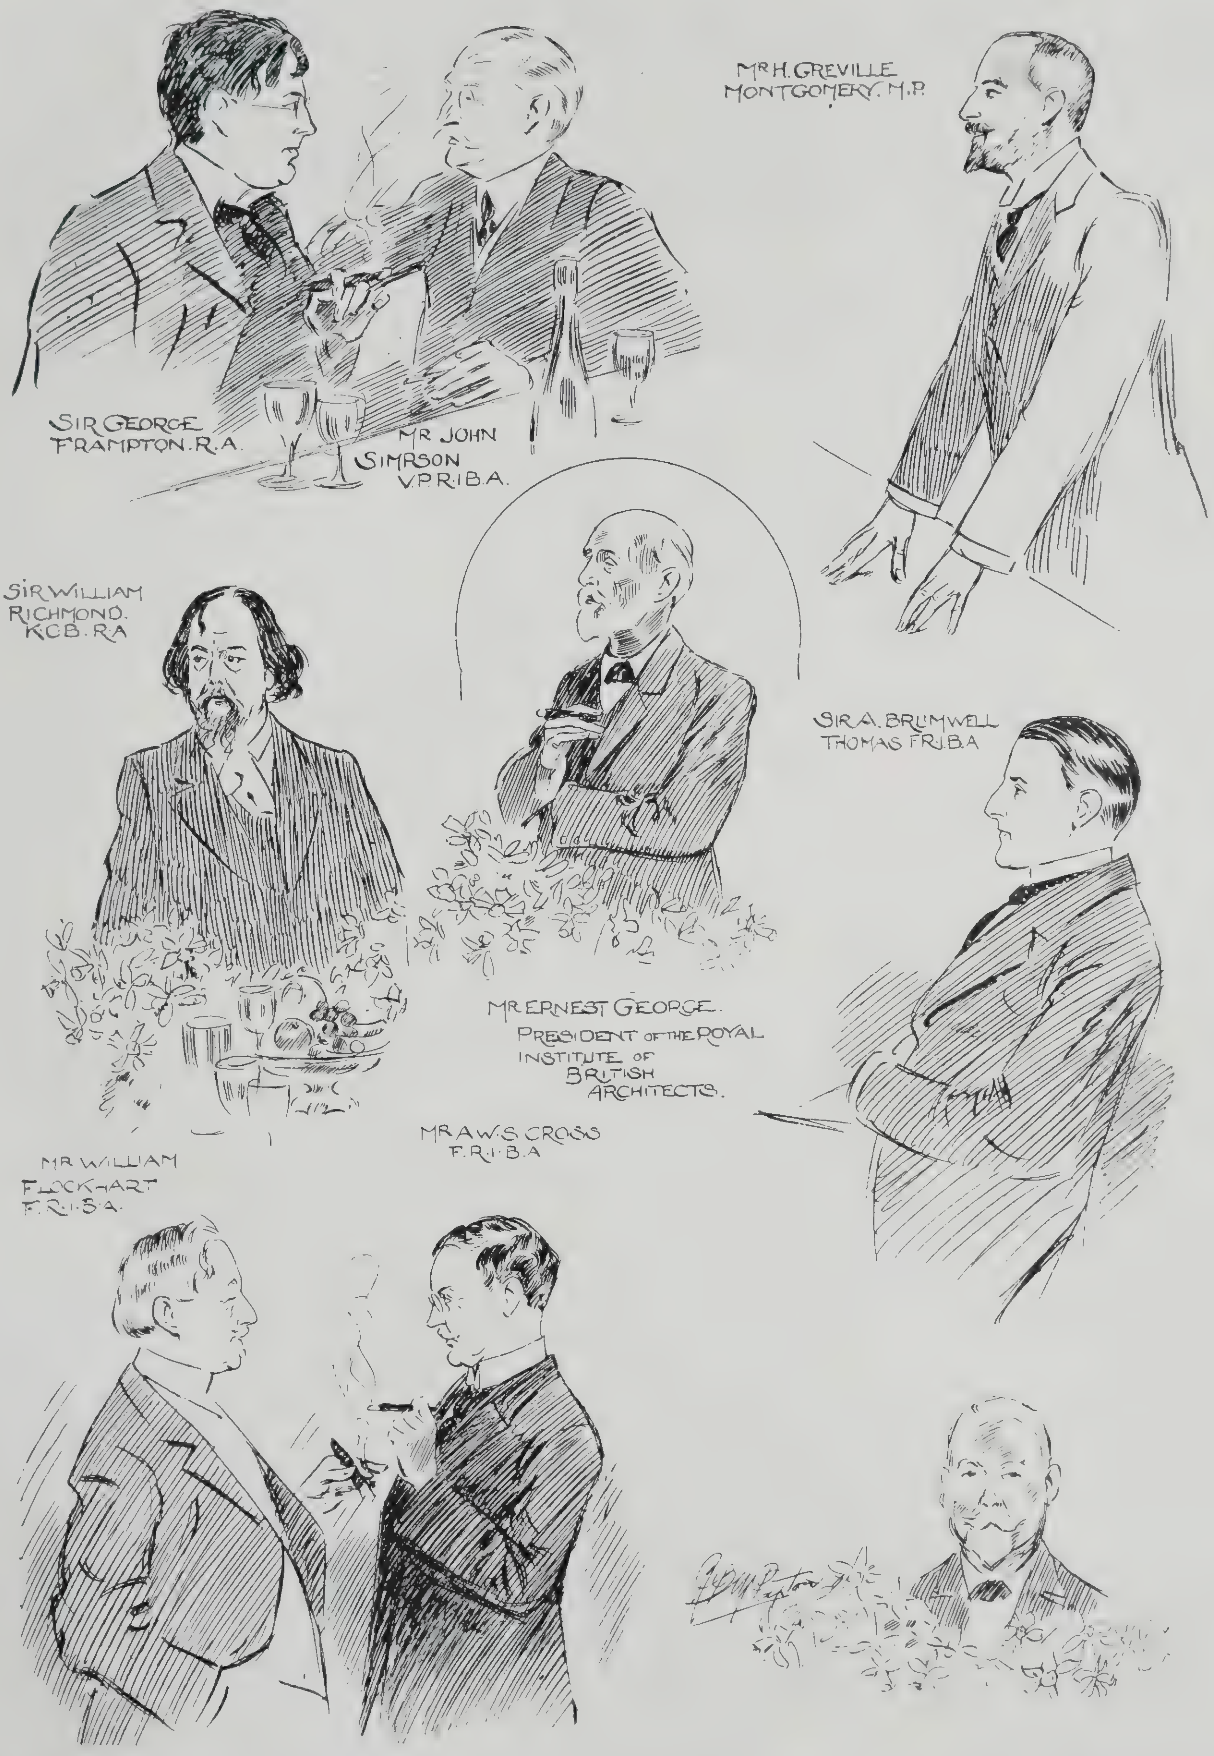
The toast was drunk to the strains of "For he's a jolly good fellow," and with much enthusiasm.

Mr. Ernest George, rising amid applause, said: "I thank you very much for the kind way in which you have drunk to my health, and we thank you most sincerely for gathering here to-day to give the exhibition your valuable support. (Hear, hear.) Such an exhibition as this teaches us a great deal, and it is our business to know what is going on in the building world. (Hear, hear.) We find here to-day excellent samples of every material and appliance to help us in building, and those who pursue that most important art should be fully cognisant of all that is happening in connection with it. (Hear, hear.) The subject, perhaps has never been so amply demonstrated before, and I hope this exhibition will give a stimulus to the building trade in the slack time, when the trowel and hammer are silent in our streets. (Hear, hear.) When labour is becoming increasingly costly it is our business to know all the labour-saving appliances. You (Mr. Chairman) have spoken of Venice. I have been watching the progress of the building of that great tower, the Campanile of St. Mark's. It is now about 200ft. high, and is being built without scaffolding. I think we in this country are sometimes extravagant with our scaffolding. At the four corners of this tower there are rods or stays, and a staging fixed on the top, which goes up as the tower progresses. All the work of building is done from that staging, and it moves up and down automatically, the hoist being within the tower. This has the effect of making the tower appear like a finished piece of work while the building is still going on. At the bottom are tanks in which the hard bricks are soaked for a week before they are taken to the top to be laid. But as to this exhibition, I think, Mr. Chairman, you are to be congratulated at the way in which the exhibitors have responded to your call. (Hear, hear.) It is wonderful the number of buildings and stands which have been put up and the expense incurred to show in the best possible manner all that has been achieved by the various workers. (Hear, hear.) The exhibition is, indeed, a most interesting one, and I wish it all prosperity and success. We thank you, sir, very heartily for all you have done to make it so successful." (Applause.)

Sir Henry Tanner, in calling on Sir William Richmond to propose the "Health of the Chairman and success to the Building Trades Exhibition," said "Mr. Greville Montgomery took on this exhibition fourteen years ago at the Agricultural Hall. There are amongst us to-day, doubtless, some who can remember what those exhibitions were like then, and who can fully appreciate the great improvements which have been carried out by Mr. Montgomery from time to time. (Hear, hear.) We have got an exhibition to-day which seems to have eclipsed all its predecessors both in the arrangement and the finish of the different exhibits. (Applause.) The exhibitors seem to have taken more pains than they were wont to do to make their stands attractive. (Hear, hear.) Mr. Montgomery, by this occasion, has given us an opportunity of seeing once again many friends who in the ordinary course of things we do not often meet, and not least, he has given us a most luxurious luncheon, which perhaps would be to our detriment if we had it every day. (Laughter.) With just these few remarks I will leave it with Sir William to ask you to drink heartily to the toast."

Sir William Richmond said: "The last speaker has given me the responsibility, he tells me, of proposing the toast. Well, as he doesn't choose to himself absorb that interesting duty, I will carry it out in a few words, because we are not here to listen to speeches, but to enjoy an extraordinarily interesting exhibition. (Hear, hear.) I have been taken round a few of the edifices and experiments displayed on the various stands, and I was amazed and confounded by the enterprise which still remains in this old country of ours. (Applause.) I did not see, I am glad to say, more German names than are necessary under existing circumstances—(cries of 'Oh! Oh!' and laughter)—and I am bound to congratulate such a courageous individual as Mr. Montgomery, who for the last ten or fifteen years has been stemming a tide and fighting well for the interests of our own country. (Hear, hear.) Now, in the presence of all these distinguished architects I have no right to give an opinion on the exhibits, but still I do feel that in this country it is essentially necessary that we should continue to press forward and cultivate ideas. We must not stagnate ourselves, nor must we allow ourselves to be stagnated. I know it is the opinion of all here, when I say that we must develope ourselves, profiting by all that we can gain from other countries, absorbing all that is good, and rejecting all that is bad and against the natural instincts of Englishmen and good taste. (Hear, hear.) With these few words, permit me to wish long life, happiness, and prosperity to our excellent president, and congratulate him heartily on the success, not only of this enterprise, but also of previous enterprises. May he give us many more such exhibitions in a like measure as excellent." (Applause.)

Mr. Greville Montgomery, M.P., after the toast had been accorded with musical honours, said in reply: "I thank Sir Henry Tanner and Sir Wm. Richmond for the kind way in which they have proposed the toast of my health, and I thank you, gentlemen, for receiving it so enthusiastically. (Hear,



SIR GEORGE FRAMPTON. R.A.
MR JOHN SIMPSON V.P.R.I.B.A.
MR H. GREVILLE MONTGOMERY. M.P.
SIR WILLIAM RICHMOND. K.C.B. R.A.
MR ERNEST GEORGE. PRESIDENT OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.
SIR A. BRUMWELL THOMAS F.R.I.B.A
MR A.W.S. CROSS F.R.I.B.A
MR WILLIAM FLOCKHART F.R.I.B.A.

SKETCHES BY OUR SPECIAL ARTIST AT THE LUNCHEON FOLLOWING THE OPENING OF THE BUILDING TRADES EXHIBITION.

hear.) Sir William Richmond has said, and he is quite correct, that we do not indulge in long speeches at these exhibitions. Indeed, I am so accustomed to hear dry speeches elsewhere, that I do not desire to inflict speeches upon anyone else unless I am obliged to do so. (Hear, hear, and laughter.) I do not desire to say anything about the exhibition, because I think it speaks eloquently for itself—(applause)—but I do want to pay a tribute to all members of the architectural and building professions who have stood by me in getting a really good exhibition. (Hear, hear.) I am sorry that Sir Aston Webb is unable to be present. (Hear, hear.) He has sent me a letter in which he states that he expected a client at 12 o'clock to-day, and who was coming from the Continent, and regrets that under the circumstances he should be unable to be present at our luncheon. Well, gentlemen, it happens that his client is a lady, so that we can quite understand why he cannot come! (Loud laughter.) I should also like to mention the fact that my friend, Mr. Fitzroy Doll, has been in London on Saturday on only two occasions during the last five years. The previous occasion was that of our last building exhibition at the Olympia, and he is here again to-day. (Applause.) It is only with the help of such enthusiastic gentlemen that I am able to carry on exhibitions such as these, and I thank you all very sincerely for the kind way in which you have received this toast, and given me your support. I only hope it will be my great pleasure to see you all again on a similar occasion two years hence." (Applause.)

The Chairman having invited the company to tea later in the afternoon, an adjournment was made to the exhibition halls.

OFFICIAL VISITS TO THE EXHIBITION.

The first of the official visits of societies, etc., connected with the building trade, took place on Saturday last, the opening day, when the Architectural Association, to the number of about sixty, assembled at three o'clock, to make a tour of inspection, and were afterwards entertained to tea by Mr. H. Greville Montgomery, M.P. Sir A. Brumwell Thomas, F.R.I.B.A., vice-president, proposed a vote of thanks to Mr. Montgomery, congratulating him on the excellent exhibition this year, to which Mr. Montgomery briefly replied. On Monday the Concrete Institute paid its formal visit, and last night (Tuesday), the National Federation of Building Trades' Employers assembled at the Exhibition at 5.30. To-day (Wednesday) the Royal Sanitary Institute will be at the Exhibition, and the remaining fixtures are as follows:—April 23rd, the Society of Architects; April 24th, the Institution of Municipal Engineers, and the Royal Sanitary Institute (second visit); April 26th, the Surveyors' Institution; April 27th, the Institute of Clayworkers; April 28th, the Institute of Sanitary Engineers.

Proposed New Works.

BIRKBY.—The Huddersfield Town Council is considering the erection of new schools to provide accommodation for 1,638 scholars.

BLACKBURN.—The Town Council has decided to proceed with the scheme for a new quarter sessions house and police courts, also a big public hall with lesser assembly rooms. The estimated cost of the building is £113,000, and the site has cost £80,000.

BOURNEMOUTH.—The Town Council has decided to proceed with the erection of a pavilion or Kursaal on the Belle Vue site, at an estimated cost of £70,000. The building is to include a great hall, small hall, dining-rooms, buffet lounge, billiard-room, ladies' room, covered promenade, open air promenades, and an open air bandstand.

DIDSBURY.—Mr. Peter Watson, of Prestwich, has applied to the Manchester Watch Committee for a dramatic licence for the Constitutional Club building here, the idea being to gut the building and reconstruct it as an Empire Theatre. Considerable opposition has been manifested to the scheme.

EXETER.—Mr. Carnegie has promised £15,000 to build a new library, provided the citizens find a free site and pledge the penny rate for the support of the institution.

GARSTON.—A Preliminary Committee of residents is negotiating with the Liverpool City Council with a view to obtaining a sum for the erection of an accident and emergency hospital.

HULL.—Plans for the rebuilding of the Theatre Royal, submitted by the Sefton-Parry Syndicate, Ltd., have been approved by the Town Council.

LONDON, MARYLEBONE.—The Borough Council is considering the erection of new offices, and the President of the R.I.B.A. is to be asked to nominate one to advise on the various available sites.

LONDON, W.C.—"The Daily News" is authority for the fact that a new theatre, to be called the King Edward Theatre, is to be erected on a site between Cambridge Circus and Oxford Street—presumably in Charing Cross Road. The building, it is said, will have extensive frontages to three streets, and is intended to hold from 2,000 to 3,000 people. Mr. William Holles is mentioned as the building owner.

LONDON, WESTMINSTER, S.W.—The organ for the new Roman Catholic Cathedral is to cost £8,000, and will be one of the most powerful instruments in an ecclesiastical building. The scheme is under the direction of Mr. Terry, the organist to the Cathedral.

MATLOCK. — The L.G. Board have granted a loan of £8,500 further to the £20,000 obtained by the Matlock Bath Urban Council under their special Act of 1906 for improvements in promenades, pavilions. The new loan, with a balance of from £3,000 to £4,000 of the former loan, is required to erect a Kursaal, pump-room, and Council offices. Mr. F. W. Ackland Hodge, of 101, Gower Street, London, and Mr. John Nuttall, of Matlock, are joint architects for the scheme.

NOTTINGHAM.—The Nottinghamshire Joint Sanitary Committee are considering the reinstatement of the Shire Hall after the recent fire. It has been decided to carry out some needed alterations and extensions, and the county surveyor has prepared a scheme estimated to cost £4,000.

SHEFFIELD.—A new central library is to be erected here, and the city architect has submitted a design to the Free Libraries Committee, for a building on a site known as the Times Buildings site, which has frontages to Bow Street and Pinfold Street.

SOUTHPORT.—A scheme for a new building in Low Street, to include a theatre, concert hall, ball-room, billiard-room, restaurant, cafe, and roof-garden theatre, is being mooted by the Lyric Theatre Company (Manchester), Ltd. Mr. H. Arnold Turner, of Manchester, has prepared a design for the same.

STOKE-ON-TRENT.—The Town Council has decided to proceed with the proposed extensions to the Town Hall, to cost £20,000. An open competition for designs is to be instituted.

TODMORDEN.—The Town Council is applying to the L.G. Board for a loan of £14,120, for the erection of a new secondary school.

WEST BROMWICH.—The L.G. Board has held an inquiry into the application of the Town Council to borrow £11,000 to erect a refuse destructor in Lake Lane.

The Manchester Education Committee and the Architectural Profession.

SIR,—The Manchester Corporation has, for some years past, maintained a drawing office in connection with the Education Committee, in which all designs for new school buildings, and for alterations to existing buildings, have been and are prepared. Thus architects practising in Manchester are excluded from this work, and in the case of alterations the original architect may see his work copied or reproduced without any acknowledgment by the Committee.

Surely a Corporation is not justified in setting up a department to do the work of an established profession unless it can show clearly that the public will be thereby better served.

The Education Committee has had ample time to prove that its architectural department either does or does not justify its existence. Can the Committee point to any superiority either in planning or in architectural treatment? While, as to cost, if the Committee will state the average cost per scholar of the new buildings, and will make a full return of the cost of maintaining its drawing office, it is submitted that it would at once be clear that its method does not make for economy.

The Manchester Society of Architects recently sent a protest to the Lord Mayor with reference to the new secondary school about to be erected in Chorlton Street in accordance with the method indicated above. . . This new school was planned by the Education Committee as an extension to the existing schools, which were built a few years ago by well-known Manchester architects. These existing schools provide good accommodation for secondary education at an actual cost, including some deep and difficult foundations, of £43 per scholar. In the design for the new schools . . . the estimated cost, as shown by the accepted tenders . . . so far is £53 per head, an increase of about 25 per cent.

Architects have at least the right as ratepayers to demand the same reasonable efficiency and economy in the spending of their money as would be demanded of them in their practice.—Yours truly,

ARTHUR S. BREWIS,
Secretary, Manchester Society of Architects.
Canada Chambers, 36, Spring Gardens,
Manchester.

THE HORSE GUARDS PARADE

Correspondence has passed between Mr. Lewis Harcourt, First Commissioner of Works, and Mr. F. W. Speaight regarding the latter's scheme of alterations in St. James's Park and the Horse Guards Parade. Mr. Harcourt, writing on April 2nd to acknowledge the receipt of Mr. Speaight's letter drawing attention to his proposals, which had previously been submitted to the Press, said: "You will probably have seen the answer which I gave in the House of Commons on March 8th, in which I said that I have no intention of doing anything to destroy the historic associations or the present beauties of one of the most charming of the London parks. As I believe that the alterations suggested by you would have this effect I am unable to promise them any favourable consideration." In reply to an inquiry by Mr. Speaight as to whether the Board of Works was opposed to any alteration being made in the Parade Ground, Mr. Harcourt wrote on the 5th inst.: "My objections apply with equal force to the suggested rearrangement of the Horse Guards' Parade and the incongruous collection around it of a number of miscellaneous London statues of various scales, designs, and dates." Mr. Speaight protested that the principle of his proposal was to effect an improvement in the present shapeless condition of the Parade Ground, and that "to condemn the scheme on account of one or two details must seem to many like condemning the plan of a house on account of the colour of one or two of its wallpapers." Mr. Harcourt's reply, which closed the correspondence, was dated April 7th, and was as follows: "In answer to your letter of the 6th, I think it right to say that my objection to the proposed rearrangement of the Horse Guards Parade applies to the whole scheme, and not only to the collection of the statues. In accordance with your permission, I am sending the correspondence to the Press."

NOTICES OF THE EXHIBITS

By FREDERICK CHATTERTON, A.R.I.B.A.

Explanation and Guide.

1. On the next page is given an alphabetical list of all the exhibitors whose stands are noticed, showing the respective numbers of their stands and the pages on which the notices appear.

2. For those who desire to study the exhibits connected with any particular trade, the notices have been divided into sections, of which a list is given on page 351. At the beginning of each section is a plan of the Exhibition, which, with the index below it, clearly indicates the position of every exhibit included in that section. The positions hatched on the plan are those of firms whose principal exhibits are noticed in another section, but who are showing some speciality connected with the section in which this cross reference occurs.

3. At former Exhibitions we have had numerous enquiries from visitors who know the name of some speciality but not that of the firm exhibiting it. We, therefore, give on page 352 an alphabetical list of articles in the Exhibition having special or proprietary names, with the names of the firms showing them. It must be clearly understood, however, that this list does not include articles already indicated by the title of the firm—as, for example, Vulcanite, shown by Vulcanite, Ltd.; or Ripolin paint, shown by Ripolin, Ltd.—and visitors are therefore recommended to study the General Index on the next page for other articles similar to the two examples mentioned.

GENERAL INDEX.

NOTE.—The Exhibits of the firms under are dealt with in the various sections in this issue. The page numbers given are those on which the notices appear.

TRADE NAMES.

NOTE.—The following are the trade names of a number of Exhibits with the names of their Exhibitors. It must be understood that the list does not include those specialities indicated in the title of the proprietary firm, as, for instance, Vulcanite—exhibited by Vulcanite, Ltd., or Ruberoid—exhibited by the Ruberoid Co., Ltd. For such exhibits see the General Index opposite.

“Acme” tiles	Colthurst, Symons and Co., Ltd.
“Armadek” composition flooring	Art Pavements and Decorations, Ltd.
“Asbestone” slabs, sheets, etc.	The British Uralite Co. (1908), Ltd.
“A.W.P.” washable water paint	D. Anderson and Son, Ltd.
“Ay-Vee” paint	Archibald Vickers.
“Beck” hot-water system	Atmospheric Steam Heating Co., Ltd. (1907).
“Burkone” grates	Standard Range and Foundry Co., Ltd.
“Cable,” Barker's system of low-pressure hot-water heat	Richard Crittall and Co., J. F. Phillips and Son.
“Carbolineum Avernarius” wood preservative	C. A. Peters, Ltd.
“Carrara” glazed terra-cotta ware	Doulton and Co., Ltd.
“Del” partitions	Gardel, Ltd.
“Devon” fires	Candy and Co., Ltd.
“Deydo” water paint	Pinchin, Johnson and Co., Ltd.
“Dovetail” corrugated sheeting	The Lewis Construction Co., Ltd.
“Ebnerite” jointless composition flooring	J. F. Ebner.
“Eclipse” glazing	Mellowes and Co., Ltd.
“Endelline” enamels	Thomas Parsons and Sons.
“Ephos” sanitary ware	Dawson and Co., Ltd.
“Eternit” asbestos slabs, slates and fireproof doors	Machin and Koenig. and G. R. Speaker and Co.
“Falconite” white enamel	Wilkinson, Heywood and Clark, Ltd.
“Ferrocrete” cement	Associated Portland Cement Manufacturers (1900), Ltd.
“Fluxite” soldering paste	Auto-Controller and Switch Co.
“Grip-back” wall tiles	G. Woolliscroft and Son, Ltd.
“Interlocking” roof tiles	H. J. and C. Major, Ltd.
“Japolite” enamel	Walter Carson and Sons.
“Klinkerite” partion blocks	Dawson and Co., Ltd.
“Kulm” fireproof partition slabs	Horace W. Cullum and Co.
“Lacreite” enamels	Thomas Parsons and Sons.
“Lockwoven” mesh reinforcement	James H. Tozer and Co., Ltd.
“Mack” slabs and partitions	J. A. King and Co.
“Michellite” petrol air gas	North British Plumbing Co., Ltd.
“Minerva” paint	Pinchin, Johnson and Co., Ltd.
“Monolithic” brickwork	Richard Johnson, Clapham and Morris, Ltd.
“Muraline” water paint	Walter Carson and Sons.
“National” automatic temperature control	Atmospheric Steam Heating Co., Ltd. (1907).
“Omne-Tempus” cloth	Samuel Bros.
“Osbornite” fuel	Smoke Consumption, Ltd
“Paragon” tiles	Colthurst, Symons and Co., Ltd.
“Pulsial” hot-water system	Werner, Pfleiderer and Perkins, Ltd
“Queen” combined gas and coal range	Thomas Potterton.
“Rexilite” bitumen dampcourse	Vulcanite, Ltd.
“Sesame” automatic doors	Pemberton, Arber and Carey.
“Sideroleum” wood preservative	D. Anderson and Son, Ltd.
“Silveroid” silver paint	Pinchin, Johnson and Co., Ltd.
“Sirapite” plaster	The Gypsum Mines, Ltd.
“Solignum” wood preservative	Major and Co., Ltd.
“Sotor” preservative for wood in sea water	C. A. Peters, Ltd.
“Star Vacuum” feed water heater, purifier, etc.	Atmospheric Steam Heating Co., Ltd. (1907).
“Steleonite” stamped steel ceilings	Emdeca Sanitary and Artistic Metal Decoration Co., Ltd.
“Stoniflex” roofing felt	D. Anderson and Son, Ltd.
“Syronite” rust preventative	Pinchin, Johnson and Co., Ltd.
“T.L.B.” bricks	Thomas Lawrence and Sons.
“Tudoresk” panelling	H. C. Cleaver, Ltd.
“Universal” roofing sheets	J. Sankey and Sons, Ltd.
“Vitrolite” paint	Walter Carson and Sons.
“Windmill” roofing tiles	Watson Nelson, Ltd.
“Xelite” plaster	Clark and Co.

202	M	Young's Patent Hygienic Bin Co. (Storage Bins), p. 356.

B. T. BATSFORD, 94, HIGH HOLBORN, LONDON, W.C. STAND 120. ROW G.

B. T. BATSFORD 94 HIGH HOLBORN
B.T. BATSFORD

It would be safe to say that out of any score or so of representative architectural works on the architect's bookshelf, three quarters have been published by Mr. Batsford, whose reputation in this respect is unique. To those visitors who have not inspected his well-stored shelves at 94, High Holborn—and this applies more particularly perhaps to those from the provinces—this stand will prove a centre of deep interest, for here may be seen a very fine collection of works published from this house.

Amongst recent books, may be mentioned Bankart's "The Art of the Plasterer," Garner and Stratton's "Domestic Architecture of the Tudor Period," etc. Every branch of architecture and the allied arts and sciences is represented, from Gotch's "Architecture of the Renaissance in England," to Rea's "How to Estimate."

Mr. Batsford's renown as a publisher of works on architecture and kindred subjects is world-wide; and his reputation is based not merely on his excellent choice of subject-matters and of the right men to deal with them. His instinct—for it would seem to amount to that—is in this respect so true and sure that he has succeeded in adding quite a remarkable number of standard works to the literature of architecture and archæology. But what is almost equally noteworthy is Mr. Batsford's very clear recognition that, since these works are destined to be handled by persons of refined taste, they should be produced in a manner that shall be in full sympathy with their subject, and perfectly in keeping with the surroundings in which they will ultimately be found. In paper, printing, binding, and illustrations, all Mr. Batsford's publications reach a high level of excellence, as the exhibits on this stand conclusively show.

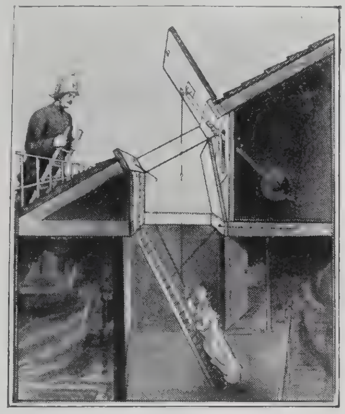
THE BRILLIANT SIGN CO. (1907), LTD., 38, GRAY'S INN ROAD, LONDON, W.C. STANDS 194 AND 194a. ROW M

This company, which has thirteen branches in different parts of the world, has recently erected new works at 131, Uxbridge Road, W., and is exhibiting a large selection of new designs of "Brilliant" letters. These letters are stamped out of stout copper by means of steel dies, and have a burnished gilt finish. In addition to the foregoing the company's "Brilliant" plate-glass fascias, stallplates, swing signs, tablets, etc., are displayed in a representative series, together with a great variety of wood letters and illuminated signs.

The growth of artistic taste among the general public is manifested in no small degree by the greater refinement observable within recent years in the lettering and general "display" of the announcements of a more or less permanent character that are indispensable to business premises. The power of a badly selected sign, fascia, or stallboard inscription to mar completely the appearance of an entire frontage—or, in the instance of a particularly blatant and domineering sign—to vulgarise an entire district—is only too well known to architects, who often have to deplore the ruin by this simple but deadly effective means of their best-laid schemes.

The tendency nowadays, however, is towards neater and more refined, but not less bold and effective forms of fixed advertisement, and the exhibits on this stand demonstrate very clearly that bold effects are compatible with genuine artistic taste. The "Brilliant" lettering is both bold and beautiful.

THE BUILDING ACTS FIRE ESCAPE CO., 4, SOUTHAMPTON ROW, LONDON, W.C. STAND 137. ROW H.



It is to be supposed that, in spite of the enormous increase during recent years of buildings that are constructed on fire-resisting principles, structures of an older and more inflammable type still preponderate enormously; and the most perfectly devised fire-resisting structure is likely to contain the most highly inflammable goods. The building itself may be theoretically and actually safe enough; the risk arises from the contents. Hence it is not likely that the precautions against risk to human life will be in any degree relaxed in consequence of improved methods of building. Means of escape from fire are therefore entirely relevant to the present exhibition, and they are sure to receive careful attention from architects who aim at producing buildings that shall offer the completest possible immunity from risk.

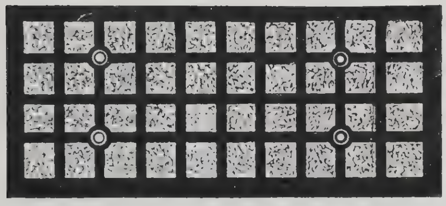
In order to comply with the provisions of Section 12 of the London Building Act, which requires—in certain circumstances—that trap-doors providing access to roofs, should open automatically, this Company has patented the "Bafeco" automatic trap-door fire escape, a full size working model of which is exhibited at this stand.

The mechanism is exceedingly simple, and by a system of adjustable levers, a counterweight, pulleys, etc., the trap-door can be instantly opened or closed. All that has to be done is to pull a handle—as one would a bell-rope. A special point to be noted is that the act of closing securely locks it.

It is adaptable to any size or weight of trap-door, no matter whether in a flat or sloping roof.

Some interesting electrically-driven models—to scale—are also on view.

THE DIAMOND TREAD CO., LTD., 28, VICTORIA STREET, WESTMINSTER, LONDON, S.W. STAND 193. ROW L.



This exhibit comprises a number of specimens of the company's patent treads, and various specialities embodying the non-slipping principle. In regard to the treads, these are of steel, grooved in their length with dove-tailed channels, which are filled in with carborundum. A recently introduced pattern is made of either cast-iron, gun metal or brass, and has the non-slipping material in the form of 1in. squares. This type presents an increased surface of carborundum, and is therefore well adapted for manhole covers, coal plates, etc.

The staircase to be seen at this stand illustrates in a practical way the application of the company's patents

Another novelty on view consists of a patent tile, with a central filling of carborundum, specially valuable for lavatories, bathrooms, etc. Carborundum may be had in 1in. squares, for use in conjunction with ordinary floor tiling.

Diamond Treads have been used in the following buildings:—Underground Electric Railways Co., of London, Ltd., Waring-White Building Co., Ltd., Bell Bros. and Thompson, for Liverpool Overhead Railways; H.M. War Office, Woolwich Centre; H.M. War Office, Aldershot Centre; Crittall Manufacturing Co., Braintree; St. Pancras Iron Work Co., Ltd.; Scott and Middleton, Ltd. (City and South London Railway); Fulham Steel Works, Ltd.; Wm. Whiteley, Ltd., Westbourne Grove; London and South-Western Railway; Manchester City Architect, Town Hall; Spencer, Santo and Co., Ltd., for Borough of Paddington; Mayoh and Haley; Westminster City Council; Alex. Robertson and Co.; Marshall and Snelgrove, Oxford Street; Ismay, Imrie and Co., White Star Line; H.M. Admiralty, Dockyard and Barracks; District Railway Co.; etc., etc.

B. J. HALL AND CO., LTD., 39, VICTORIA STREET, WESTMINSTER. STAND 16. ROW B.

In these days of rush and hurry the photo-copying process for plans has come as a boon and a blessing to architects, surveyors, and others. This firm are showing their "Line-fast" photo copier; and their "Ordoverax" photo reproductions, as well as "everything for the drawing office." Among these are many new things that will be of interest to professional men.

JULIUS HULSEN & CO. COLLINGWOOD BUILDINGS, COLLINGWOOD ST., NEWCASTLE-ON-TYNE. STAND 109. ROW G.

An exhibit such as this, consisting of various chemical preparations and glazes used by brick manufacturers, does not lend itself to illustration, and consequently one does not appear in the space set apart for a block.

This firm show a large selection of their glazes and colours as employed by the manufacturers of glazed bricks and tiles, earthenware, sanitary ware, etc., and a variety of other specialities such as leadless glazes; glazes containing lead (suitable for glazing fireclay and red and white bodies); Majolica, art, matt, lustre, and flowing glazes; underglaze and enamel colours; colouring bodies or stains for dips and glazes, etc.; potters' oxides; glazed specimens; and a preparation containing precipitated carbonate of barytes for the prevention of scum and discolouration on facing bricks, terra cotta, and similar wares.

"RONUK," LTD., PORTSLADE, NEAR BRIGHTON. STAND 43. ROW B (GALLERY).

Of the many improvements effected in recent years in the sanitation of hospitals and other large institutions, none is of greater importance than the introduction of polished wooden flooring. The adoption of this flooring met a want, and also created another. Some material was demanded which would give the floors a smooth, hard, durable, and, if possible, waterproof surface. These requirements are fulfilled by the "Ronuk" Sanitary Polish, as may be seen at this exhibit, which consists of a complete room (open on two sides and panelled with oak), with an oak parquet floor, prepared and polished on the particular method advocated by this company. "Ronuk" is also supplied as a liquid, but in this form is unsuitable for use as a first preparation of new wood.

The importance of constructing a good floor is hardly greater than that of keeping its surface in such a condition as shall do justice to its inherent qualities. With regard to hygienic considerations, and, in fact, with respect to all other aspects of efficiency in a floor, it is, of course, the surface that tells; and Ronuk undoubtedly affords an extremely valuable means of keeping a good floor well up to the mark.

The company make other specialities, such as stains (in five shades), "Ronuk" stopping, and pumice powder. The following are a few of the institutions in which the flooring is maintained by contract:—National Gallery, Hertford House, Tate Gallery, St. Bartholomew's Hospital, King's College Hospital, University College Hospital, Royal Free Hospital, St. George's Hospital, St. Mary's Hospital, New Hospital for Women, Italian Hospital, London Temperance Hospital, Manchester School of Technology, Manchester City Art Gallery, etc.

SAMUEL BROTHERS, LTD., 65 AND 67, LUDGATE HILL, LONDON, E.C. STAND NO. 11, ROW A.

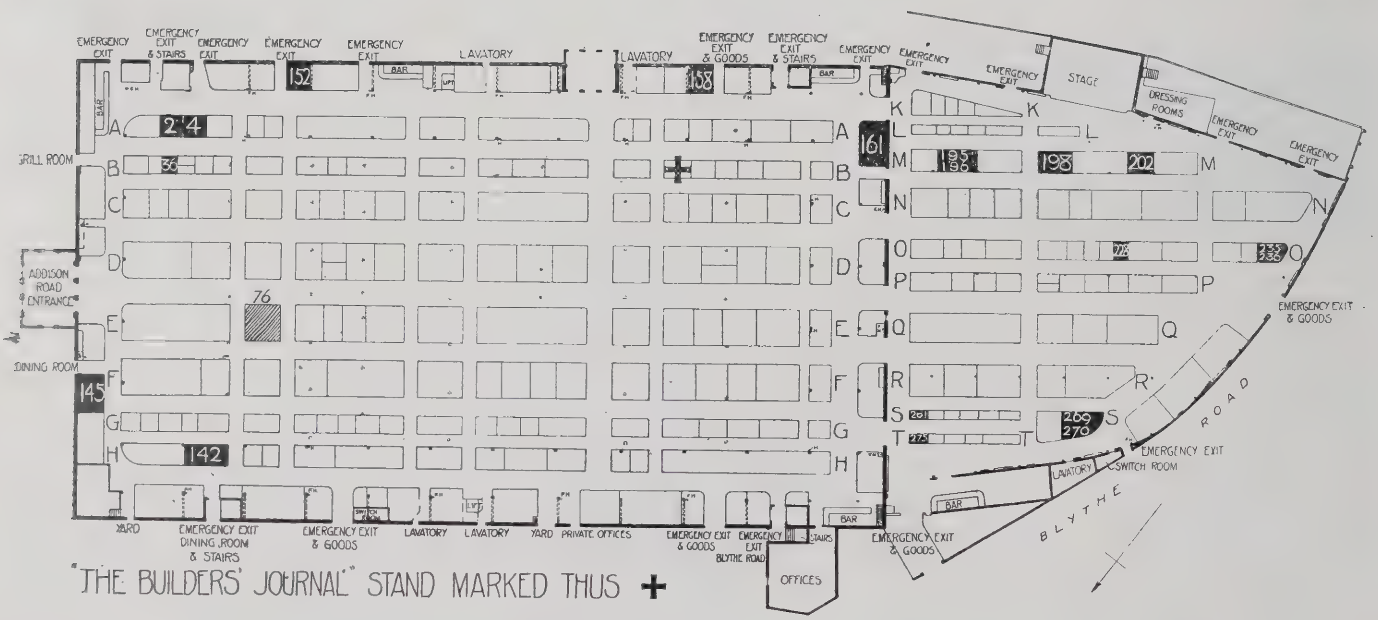
This firm exhibits "Omne Tempus" cloth, guaranteed to withstand the penetrating effects of a prolonged downpour of rain. The cloth has no rubber in its composition, so is in no sense a mackintosh.

A practical demonstration of its waterproof qualities can be seen by those interested in this class of goods. Though having but slight claim to be included among building materials and appliances, architects, and those whose duties expose them to the inclemencies of our climate, may be glad to inspect this exhibit.

An active architect, in fact, spends a great deal of his time in "the open," but more of it in the stuffy atmosphere of the office, and from the latter consideration it behoves him to take the greater care of himself when he is compelled upon occasion to venture forth into the rain. This advice is perhaps superfluous to a class of the community who are particularly alive to the virtues of an effective damp-proof course! A chill taken in consequence of getting one's clothes wet through may turn out to be an exceedingly serious matter, especially if the victim happens to be of delicate and sensitive organisation, as most architects probably are. But even those who are hardy and robust cannot get wet with impunity. Though they may themselves be physically none the worse for the "ducking," their clothes do not share this happy immunity, and in these hard times that is surely an important consideration. The highly æsthetic architect can, perhaps, afford to let his hair grow long and his clothes get shabby; but the average practitioner will be wise to keep himself tolerably well groomed. To keep his clothes from premature ruin, an "Omne Tempus" would prove to be an economical investment.

SECTION TWO.

Contractors' Plant and Machinery.



"THE BUILDERS' JOURNAL" STAND MARKED THUS +

The following firms are noticed under this section, and their stands are shown blacked on the plan with numbers in white :—

36	B	Aerograph Co., Ltd. (The), p. 353.
235, 236	O	Barford and Perkins, p. 353.
228	O	Barker, John, and Co., Ltd., p. 353.
4	A	Cowley, H. W. and Co., Ltd., p. 353.
161	Wall Space	Haigh, W. B., and Co., Ltd., p. 354.
269, 270	S	Houldsworth's Patent Barrow and Motor Wheel Co., Ltd., p. 354.
195, 196	M	Kirchner and Co., p. 354.
261	S	Leigh, Edward, p. 354.
198	M	Monninger, C. D., Ltd., p. 355.
275	T	Patent Rapid Scaffolding and Supply Co., p. 355.
152	Wall Space	Patent Safety Ladder Co., p. 355.
27		Ransome-ver mehr Machinery Co., p. 355.
142	H	Slingsby, H. C., p. 356.

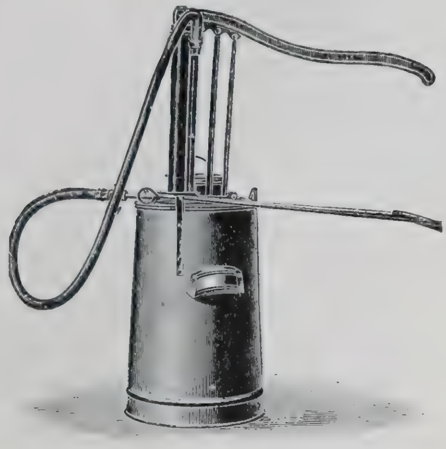
202	M	Young's Patent Hygienic Bin Co., p. 356.

REFERENCE.

The following firm is noticed in another section, but is also showing exhibits connected with this one. The stand is indicated by hatching :—

76	E	Expanded Metal Co., Ltd., (The), (Builders' Screens and Riddles) page 371.)

THE AEROGRAPH CO., LTD., 42, HOLBORN VIADUCT, LONDON, E.C. STAND 36. ROW B.



In these days of progress one is constantly coming across machines for expediting all kinds of work, and it is not surprising that the principle should have been extended to the mechanical application of paint and whitewash. Instances of the kind are to be seen at this stand, where the very useful inventions of this company are exhibited.

The paint-spraying machine consists of a handpiece (or "Aerograph" proper), an air compressor, paint pot and tubes, and the nozzles can be made large enough to cover at any desired speed, though in practice it is found that the best results are given by one covering from 3 to 5 yards per minute. Involving the same principles, the whitewashing machine is equally efficacious, and should particularly interest contractors.

Daily demonstrations are given at the following hours :—

Decorative painting .... 11 and 3.
Plain ,, ... 12, 4, and 7.

Where large expanses of wall are to be covered quickly, as in the case of warehouses, workshops, engineering establishments, and so forth, the large-sized Aerograph is invaluable; and considering that in many such cases periodical renovation is compulsory, the Aerograph would soon save its initial cost, as it not only dispenses with a large amount of labour, but is so speedy in operation that no interruption to business need be caused where it is employed, and there is obviously no necessity for the erection of any kind of scaffolding, nor for the use of ladders. But the economic and convenient attributes of the machine are perhaps, after all, not its most admirable virtues. It is an invaluable adjunct to the resources of the decorator. Post-cards produced by means of the smallest size of Aerograph have long been familiar, and the artistic effects obtained by this means are often of an exquisite beauty that is not attainable by any other means.

BARFORD AND PERKINS, QUEEN STREET IRONWORKS, PETERBOROUGH. STANDS 235 AND 236. ROW O.

The application of petrol or paraffin motors to road rollers is a sign of the times, and a thing to be looked for. It is now five years since this firm first introduced and exhibited their motor roller, and the intervening period has already produced improvements in its general design. Experience has shown that it was desirable to increase the dimensions of the motor in order to develop the necessary power at a lower speed of revolution.

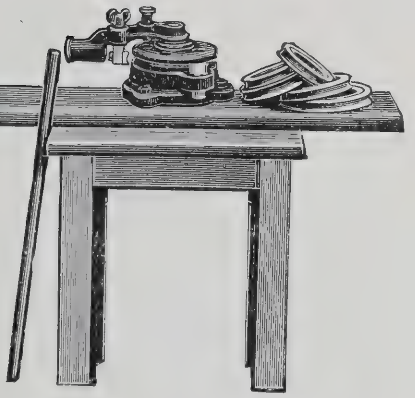
Barford and Perkins are always in the van of the movement; and in this instance, eminently practical as they are, they are also the instruments of a sort of poetic justice. By motors are roads destroyed; by motors shall they be mended.

Where required, this roller can be fitted with a small water tank, and connections for watering both the front and back cylinders, when the roller is used for tar paving.

One of the latest patterns of patent water ballast motor rollers is on view at these stands, where full information concerning its structure, price, etc., may be obtained from those in charge.

Among regular users may be mentioned: H.M. Government, the County Council of Northumberland, the Corporations of Barrow-in-Furness, Birmingham, Hull, Jarrow, etc., Roadite, Ltd. (Ferromac), Bath; the Road Paving and Cement Co., Ltd., the M.C.C. for Lord's Cricket Ground, the Jockey Club, Newmarket, the Newbury Racecourse Co., the Russian Imperial Government, three racecourses in Japan, and numerous private owners, etc., etc.

JOHN BARKER AND CO., LTD., KENSINGTON, LONDON, W. STAND 228. ROW O.



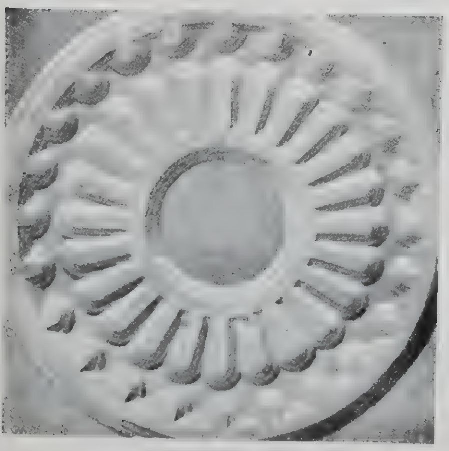
Messrs. Barker and Co. are exhibiting at this stand the "Kennedy" patent bending machine, which is constructed to bend welded, butt-jointed, and seamless tubing; also round, flat, angle, tee and channel bars, in copper, brass, iron, or other metals.

Such a machine as this has only a general interest for architects, but engineers and contractors will find its utility for bending cold, solid bars for concrete reinforcement a matter worthy of their close attention.

Practical demonstrations of bar bending, in which various sections will be dealt with, will be given.

The machines are made in several sizes, and of various capacities, and the following is a list of public bodies, railways, firms, etc., now using them :—The Admiralty, H.M. Office of Works, Military School of Engineering, Chatham; Royal Ordnance Factories, Woolwich; Royal Arsenal, Woolwich; Houses of Parliament, Works Department; India State Railway, Bombay; India State Railway, Calcutta; India State Railway, Madras; British Columbian Pacific Railway Co.; H.M. Post Office; F. A. Glover and Co., electrical engineers; Takata and Co., Japan; H. and W. I. Nelson, Ltd., Ship Owners, Liverpool; White Star Line; Gt. N. Railway; L. and N.W. Railway Co.; L. and S.W. Railway Co.; Gt. Eastern Railway Co.; Gt. Western Railway Co.; Midland Railway Co.; Gt. Central Railway Co.; the Gas, Light and Coke Co.; Tottenham and Edmonton Gas Light and Coke Co.; Hartlepool Gas and Water Co.; Aberdeen Corporation Works; Newcastle and Gateshead Gas Co.; County Borough of Stockport Gas Works; Nottingham Corporation Gas Works; Waltham Abbey and Cheshunt Gas Co.; Eastbourne Gas Co.; Winchester Water and Gas Co.; County Borough of Salford Gas Works; Glasgow Corporation Gas Works, etc., etc.

H. W. COWLEY AND CO., LTD., BELLA STREET IRONWORKS, DAUBHILL, BOLTON. STAND 3 AND 4. ROW A.

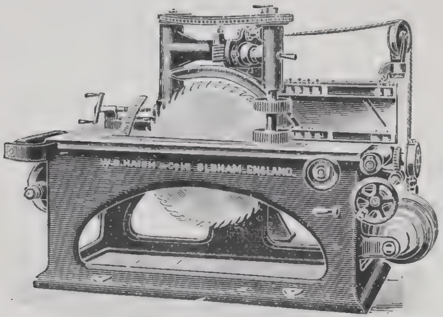


The sample here illustrated of work done on one of Messrs. H. W. Cowley and Co.'s trenching and moulding machines shows very strikingly the facility with which the compound table adapts itself to the production of decorative panels; the table revolving while the cutters operate. The No. 1 machine is for circular moulding. Mathematical correctness of radius is ensured, and as the moulds are worked by the same cutters as the straight work, the machine is particularly useful in the production of angle brackets in doors, windows, etc., where the circular moulds have to join up to the straight portions. Shurmer's patent rapid trenching and moulding machine, No. 2 (for straight moulding), is competent to perform all kinds of trenching, circular moulding, slot mortising, etc., as the table can be turned round on its central pivot, locked in position, raised or lowered, pushed backward or forward, adjusted at any angle to the spindle, as in the trenching of stair strings; and holes and slots of almost any diameter or shape can be cut, as in producing moulded panels; while the machine is equally serviceable for straight moulding.

Cowley's patent improved hollow chisel mortising machines are shown in several varieties—horizontal and vertical, with foot lever and hand lever, or to work automatically. In the chain mortiser combined with hollow chisel, the chain and the square chisel can be used either separately or both together on the same piece of timber.

In a long list of the firms using Messrs. Cowley's Woodworking Machines, the following names are included: Messrs. Bullen Bros. and Sons, Ltd., Liverpool; Hardy Robson and Co., Newcastle; R. Neill and Sons, Manchester; J. and A. Ogilvie, Aberdeen; Trollope and Sons, London, etc., etc.

W. B. HAIGH AND CO., LTD., OLDHAM AND LONDON. STAND 161. WALL SPACE.



This firm of saw-mill and joinery machinery makers show a large number of their machines, several of which are electrically-driven for demonstration purposes.

Amongst those of special interest are the blind pulley stile mortising machine, the C.X.X. friction feed four-cutter planing and moulding machine, high-speed bandsaw, with roller bearings, effecting a large saving in power consumption, three other types of planing and moulding machines, three wood-trimmers, two circular saw benches, and a number of accessories.

Among the machines shown in operation is the pulley stile mortise machine, in which the sizes for double or countersunk mortices can be easily adjusted.

A very handy planing and moulding machine of moderate cost is also running, and one of the chain mortice machines carries a new type of chain cutter, which has a remarkable wearing capacity.

A number of certificates and awards that have been gained by the firm are on view at the stand.

Among the important contracts lately undertaken by Messrs. Haigh is one gained in competition with the principal makers of woodworking machinery for the East Indian State railways. This involves very stringent tests by the Government inspectors. The firm's chief offices and works are situated at Oldham, and their London offices are at 7, Wilson Street, E.C.

Among the many establishments to which Messrs. Haigh's machinery has been supplied are the following:—William Whiteley and Co.; D. Sharp, timber merchant, Wokingham; L.C.C. School of Building, Brixton; H.M. Ordnance College, Woolwich; H.M. Military School of Engineering, Chatham; H. and G. Bisley, saw mills, Bermondsey; Davies Bros., joinery works, Walthamstow; Trollope and Sons and Colls and Sons, London.

HOULDSWORTH'S PATENT BARROW AND MOTOR WHEEL CO., LTD., PARK LANE, KEIGHLEY.
STANDS 269 AND 270. ROW S.

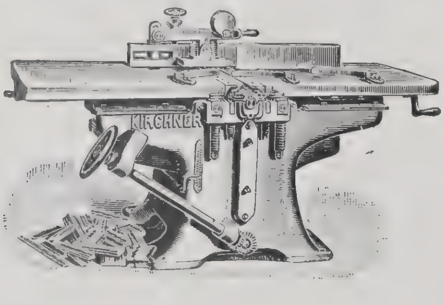
If the delicate wheels and other more intricate works of a watch can be produced by machinery, what is to prevent the accurate construction and adjustment by similar means of the wheels of a barrow, or truck, or wagon, or other form of motor? This achievement has come to pass, and the ancient wheelwright, that antique man of might and mystery, has been effectually supplanted. Venerable relics of his once numerous tribe may still linger on in remote villages; but in the towns, where wheels run fast, they must be made fast, and at this stand one may observe, with mingled awe and astonishment, the most scientific and up-to-date methods of making them. A hint of the marvels and mysteries of the revised craft is conveyed by the accompanying illustration.

A very large selection of patented goods manufactured by this firm, having particular reference to trucks and barrows, is on show at this stand, and attention is called to the new patent packer for circular saws, new patent saw setters, new patent axle for barrow wheels, new patent tip for barrow-wheel axles, etc., etc.

The saw setter consists of a long bar fitted with a sliding cone, which depends for position upon the diameter of the saw. When adjusted, the teeth rest on a steel anvil, and each alternate one is pressed down by means of a hammer-lever till all are set.

Contractors will find much to interest them here, and even the architect who follows his habit, natural or professionally acquired, of getting as close as possible to the heart of things, will not disdain to devote at least a small portion of his time to an inspection of the very ingenious appliances here on view.

KIRCHNER AND CO., 21, 23, 25, TABERNACLE STREET, LONDON, E.C. STANDS 195 AND 196. ROW M.

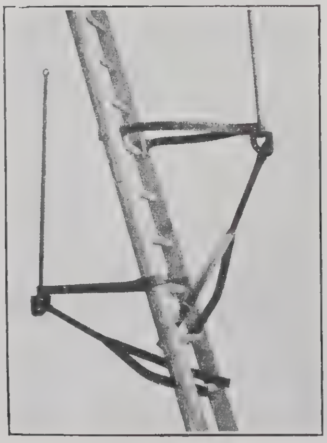


Machinery in motion at an exhibition is always secure of a constant crowd of interested onlookers, and Messrs. Kirchner's stand has been upon every occasion one of the most popular in the Exhibition. They have always something of special interest to show, and they take infinite pains to demonstrate the capabilities of their machines. The great point is that their demonstrations are never merely perfunctory. They take obvious pride and delight in them; and such enthusiasm is decidedly contagious, more especially since the necessary explanations are always given with becoming modesty. They never make the mistake of over-much insistence on the merits of their goods.

This company's exhibit is entirely devoted to a display of their improved and patented sawing and woodworking machinery, as manufacturers of which they are well known among saw millers and contractors whose business is extensive enough to necessitate the laying down of high-class plant. The interest of architects, therefore, in an exhibit of this description is not that of the specialist, but a general acquaintance with the various types of machines by which planing, mortising, thicknessing, mitring, etc., are performed is nevertheless desirable.

Messrs. Kirchner and Co. show eight such machines which embody in their design and construction all the latest improvements. For instance, their B.W.A. combined planing, thicknessing, and moulding machine calls for special attention. In this, the pressure arrangements are so adjusted that the smallest and thinnest work can be done as well as the maximum sizes, and it is, moreover, adapted for all classes of straight mouldings in hard or soft woods.

EDWARD LEIGH, 85, TAMWORTH ROAD, CROYDON. STAND 261. ROW S.



This invention is primarily intended for small constructive or repairing works, and obviates the necessity for scaffolding, which, in such cases, becomes a relatively heavy expense. Consisting of two hinged wrought-iron forks, and a vertical rod or hand-rail standard, the former are so fitted to the ladder as to form with it a triangular support, upon the horizontal top of which the end of a two-board stage rests.

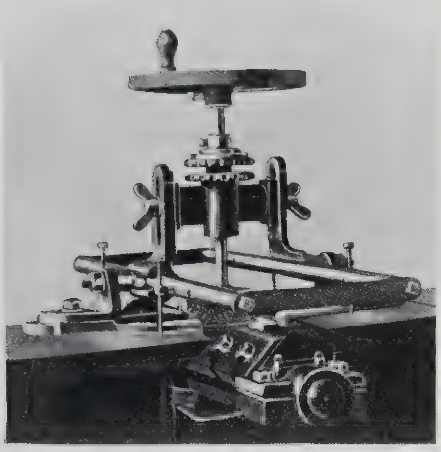
These brackets have been very thoughtfully designed, and can be used with equal usefulness in three positions:—

(a) When the ladders are vertical.
(b) In front of inclined ladders.
(c) At back of inclined ladders.

In addition to these advantages, these brackets are easily put in position, will fit any sized ladders, and can be folded up into a small compass.

The following are some of the firms to whom these ladder brackets have been supplied:—London and North-Western Railway, Great Western Railway, London and South-Western Railway; Smith and Sons, South Norwood; Higgs and Hill, Lambeth, London; Mitchell Bros., Guildford; F. Wills, Bristol; Tate and Sons, Silvertown, London; Wiltshire and Son, Sevenoaks; Royal Arsenal Co-operative Society, Abbey Wood; Wallis and Co., Eastbourne; E. Van Raalte, Poole, Dorset; Grand Junction Co., Rickmansworth; T. and S. W. Jenkins, Newport, Isle of Wight; Vaughan and Marriott, St. George's Road, London; Queen's Club Gardens Estate, W. Kensington; Huntley and Palmer's, Reading; H. Stevens and Co., Southampton; Wm. Grant and Sons, Burslem; Dennis, Sill and Son, Doncaster; Ashton Brothers and Co., Hyde; Warrington Corporation (gas department); etc., etc.

C. D. MONNINGER, LTD., 124, CLERKENWELL ROAD, LONDON, E.C. STAND 198. ROW M.



Inventiveness is nowhere more strikingly manifested than in the domain of woodworking machinery, on which ingenuity has been lavished to such an extent, both quantitatively and qualitatively, that it might almost be imagined that the limit had been reached. Every fresh exhibition, however, brings to notice further developments, until it would really appear that the field is absolutely inexhaustible. Manual labour in woodworking, even in its most delicate operations, seems to have been completely superseded, and in most cases surpassed.

A large variety of saws and woodworkers' appliances are displayed at this stand, together with numerous other specialities made by this firm.

Particular attention is called to Smith's patent hand sharpening machine for surface planing machine cutters, which is designed to supersede the old method of whetting the cutters by hand rubbing stones. It also enables the cutters of surface planing machines to be whetted without removing them from the cutter block. By the use of this machine the cutters are kept perfectly true.

Another interesting novelty shown by this firm is the patent renewable file, which has many advantages over the ordinary tool. It consists of a file holder (either solid or hollow), and thin loose file blades, to which they can be readily fixed. Re-cutting is unnecessary, as the blades are cut on both sides, and being of better temper than solid files, last longer.

Among this firm's customers are the principal English, Irish, and Scotch railways, the various Government Dockyards, Woolwich Arsenal, and the principal shipbuilding firms and saw millers.

THE PATENT SAFETY LADDER COMPANY, PRIESTGATE, PETERBOROUGH. STAND 152 WALL SPACE.

Contractors, decorators, and plumbers will find this exhibit an interesting one. This company is showing a large section of patent safety extension ladders from 6ft. 9in. to 15ft. 6in. when closed, and when fully extended, measuring from 11ft. 3in. to 29ft. in height. This latter dimension does not, however, represent the maximum height of ladders of this class, as the firm makes them up to as high as 46ft. 3in. In the larger sizes a steel cable, considerably increasing their rigidity, is inserted in the back. The extension section is raised by means of a rope and pulley attachment, and an absence of complicated catches or springs adds to the simplicity of working.

There are several other ingenious ladders on view, including the Patent Safety Extension Trestle Ladder, which has a movable collapsible platform near the top, large enough for a man to stand on.

The following is a list of some of the British public bodies to whom patent safety extension ladders have been supplied:—The Birkenhead Corporation, Walthamstow Education Committee, Manchester Corporation, Weymouth and Melcombe Regis Corporation, Glasgow Corporation, Liverpool Corporation, West Bromwich Corporation, Neath Corporation, Ilkeston Education Committee, Corporation of Westminster, South Staffordshire Waterworks, Normanton County Council, Stratford-on-Avon Corporation, Peterborough Corporation, Monmouthshire Education Committee, Nottingham Corporation, Leicester Corporation, Salford Corporation, Birmingham Corporation, Burton-on-Trent Corporation, Warrington Corporation, Plymouth Corporation, Cardiff Corporation, various gas companies in Great Britain and Ireland, and many fire brigades, etc., etc.

PATENT RAPID SCAFFOLD TIE CO., LTD., 124, VICTORIA STREET, WESTMINSTER. STAND 275. ROW T.

It is more astonishing that the old primitive methods of the scaffolder should have endured so long, than that they are now being rapidly superseded. Patent scaffolding appliances are more familiar in America and on the Continent than they are as yet in this country, where, however, confidence in their efficiency is swiftly increasing.

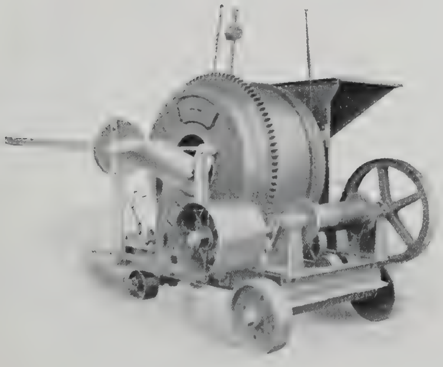
The firm under notice are manufacturers of appliances for safe and rapid scaffold erection, and are contractors for the supply, hire, or erection of all kinds of scaffolding. They are also sole proprietors of the D. Palmer Jones patent scaffolding appliances.

The company exhibit a photo of the firm's scaffold tie in use at the London Coal Exchange, the building contractors being Messrs. Holliday and Greenwood, Ltd., of Brixton, S.W.

The firm's exhibit shows the patent rapid scaffold tie in use and under test. It is therefore sure to receive the attention that is always excited by anything in the nature of movement and actuality. Exhibitors of goods that can be watched as "going concerns" enjoy, undoubtedly, a considerable advantage over those whose exhibits are necessarily of the "still life" order; for while those persons are comparatively few who are, of their own volition, able to reap "the harvest of a quiet eye," everybody is attracted and stimulated to enquiry, reflective or oral, by the observation of any kind of machinery in motion. It provokes exactly the kind of questions and answers that promote business.

The appliance under notice is long past the experimental stage, and some of the places at which it has been employed and appreciated may be here mentioned, namely:—Devonport Dockyard, Chatham Dockyard, Woolwich Arsenal, the London Coal Exchange, residences in Upper Brook Street, S.W.; the Challis Hotel, and the Convent of the Sacred Heart, Wandsworth.

RANSOME-VERMEHR MACHINERY CO., CAXTON HOUSE, WESTMINSTER, LONDON, S.W. STAND 145 WALL SPACE AND 26A, BAY.

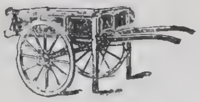


This exhibit has a special interest for engineering and general contractors, and illustrates the Ransome concrete mixer manufactured by this company. The mechanism is exceedingly simple—consisting of a revolving drum, within which is a series of scoops. These, when in motion, stir the materials with an action somewhat resembling that produced in hand-mixing, with the difference that the incorporation is far more complete and uniform. In addition to ploughing through the material over and over again, the scoops drop the concrete into a shute (whose position is controlled by a lever), from which it is discharged without necessitating the tilting of the machine.

These mixers are made in six sizes, with a drum capacity ranging from 2 to 40 cubic feet, and a working capacity (per day of 10 hours) of from 20 to 400 cubic yards.

The following is a list of some of the principal users in England: S. Pearson and Son, Ltd., Hull Joint Dock; Fisher and Le Fanu, Derwent Valley Waterworks; Sir John Jackson, Ltd., Loch Leven Water Power Works, Kinlochleven; L. P. Nott, Middle Dock Contract, South Shields; Walter Scott and Middleton, Ltd., railway works in Wales; D. G. Somerville and Co., Kodak Building, Harrow; Edmund Nuttall and Co., Liver Building, Liverpool; Holloway Bros. (London), Ltd., Caxton House, and Royal Orthopædic Hospital; Waring and White (1906), Ltd.; Selfridge Store, Oxford Street; Thos. Docwra and Son, new gasholder tank, Enfield; The Earl of Dudley, Baggeridge Colliery, Dudley; Castner-Kellner Alkali Co., building of a ferro-concrete culvert for the Weston Chemical Co., of Weston Point, Runcorn, Cheshire; C. H. Normanton and Son, Manchester; A. Jackaman and Son, Cooperative Flour Mills, Silvertown.

H. C. SLINGSBY, 142-146, OLD STREET, LONDON, E.C. STANDS 142 AND 143. ROW H.



This exhibit includes a variety of patent trucks, sack trucks, hand carts, tipping waggons, wheelbarrows, milk trucks, wheels, ladders, etc., for which this firm has taken out many patents, and been awarded, from time to time, seventeen gold medals.

The attention of those interested in traction may be called to a recently introduced tyre made of white felt, for which many advantages are claimed.

Contractors will specially note the very representative series of patent "steel-back" extension and step ladders. The former have this advantage over ordinary extension ladders, in that the front and back sections are identical in shape and size. The extension goes up at the back, and not in the front, as is usually the case, and the risk of the user missing his foothold is thereby lessened. The safety of the user would be in any case a consideration of the utmost importance morally; but in view of the serious financial liabilities of contractors under the Workmen's Compensation Act, and, it is to be feared, the spice of recklessness that has been infused into workmen by the knowledge that if anything happens to them, they or their representatives are secure of some sort of recompense, such precautions as that which has just been described assume additional value and importance. Extension ladders are, in certain circumstances, of immense advantage as compared with the ordinary kind, and, as constructed by this firm, they are even safer.

The firm's trucks, etc., are used by the War Office Department, the G.P.O., the Railway Companies, and most of the large firms, etc., etc.

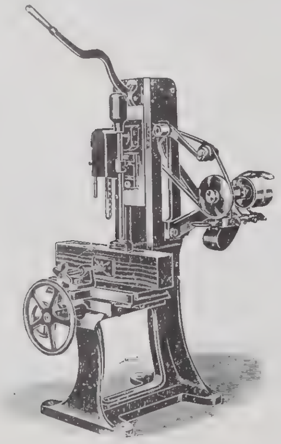
MATTHEW WYLIE, BALFOUR HOUSE, FINSBURY PAVEMENT, E.C. STAND 158. WALL SPACE.

Buildings constructed of concrete blocks would be much more common in this country if the means of producing the blocks were better known. Consequently the "Ideal concrete machines" that are being exhibited by Mr. Matthew Wylie are sure of receiving a fair share of attention from visitors.

The machines are small and portable, and, with their accessories and attachments, are capable of producing not only plain building blocks, but also ornamental designs in columns, capitals, mouldings, etc., and the blocks may be made either hollow or solid. Moreover, the "down-face" principle upon which the machine is constructed renders possible the formation of a face richer in material than the balance of the block, thus making it closer grained, more impervious to moisture, and capable of architectural treatment. The face may be made either severely plain or (to recall a felicitous expression applied by facetious young architects to a certain type of client in Mr. Swales's lecture on American architecture, "rich and rock-faced." The surface may be "panel, corrugated, cobble, rock with tool margin, bush-hammered with tool margin, bush-hammered, or broken ashler," thus avoiding "that awful monotony" that has been sometimes attributed to concrete blocks. The blocks may be of any reasonable size or shape; and a special machine produces sills, lintels, cornices, steps, keystones, pavement, slabs, etc., either solid or reinforced.

This machine is shown at an opportune moment. The utility of concrete having been fully established, the difficulty was to make it presentable. Of this problem the "Ideal" concrete machine offers a solution that has been generally accepted in the United States of America, and may, perhaps, become equally popular on this side of the Atlantic. A concrete block structure is here shown.

WILSON BROS., VICTORIA MACHINE WORKS, LEEDS. STAND 2. ROW A.



The "speeding-up" of the building industry has only become possible through the introduction of machinery in every department. This revolution has been nowhere more complete than in the joinery department, where the old leisurely methods of handwork have been almost completely superseded. Hardly a contractor, no matter how small his business, can afford to dispense with an installation of woodworking machinery; and this is one of the reasons why the duration of a contract is now counted in months rather than in years; and why, incidentally, the serenely philosophical atmosphere of the carpenters' shop, so graphically described in "Adam Bede," seems to the modern reader to be positively archaic.

Messrs. Wilson Bros. exhibit several of their well-known wood-working machines, of which the following is a list:—

One new patent "Rex" chain mortising machine, to take in wood 12ins. deep by 9ins. wide, to mortise ¼in. to 1in. wide, from 4½ins. to 6ins. deep, with ½in. chain, guide bar and sprocket, and chain cutter sharpening machine, mounted on an extended arm.

One new patent "Rex" chain and hollow chisel mortising machine, fitted with independently working hollow chisel arrangement and chain cutter sharpening machine attached.

One new design improved band sawing machine "A" pattern with ball bearings. This machine has 30in. diameter wheels, the top one being of light pattern, carried in a U arm having ball bearings on either side. The remaining exhibits are patent centre motion mortising machines to take in wood 11ins. by from 5½ins. to 7½ins. respectively.

YOUNG'S PATENT HYGIENIC BIN CO., 4 AND 8, ARTHUR STREET WEST, LONDON, E.C. STAND 202. ROW M.

The imperative need for cleanliness in every administrative department of our hospitals and sanatoria, has resulted in an increased determination on the part of manufacturers to supply such articles as cisterns, tanks, etc., so constructed as to reduce to a minimum the possibility of fouling by the elimination of rivets and internal seams. This firm's exhibit includes samples of cisterns and tanks (made under Leeche's patent) in which these are distinguishing features, the object being to provide as few places as possible for the lodgment of dirt.

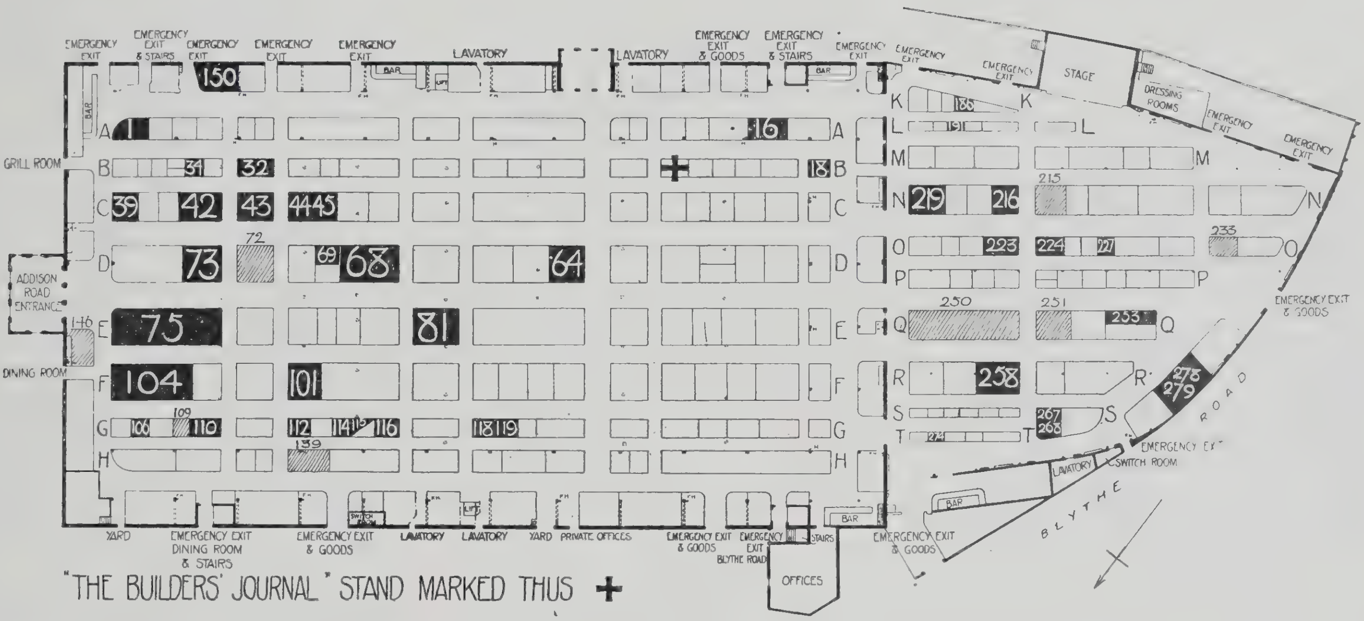
With similar intention, this firm also shows "Young's" patent sanitary and storage bins, which are made entirely without internal corners or crevices, the principle being that no part shall be inaccessible.

Among various interesting specialities comprising the remainder of this exhibit, there are some samples of automatic dry powder weighing machines (Southall and Smith's patent), which weigh and deliver automatically, and accurately, and render scaling unnecessary; Roberts's patent liquid filling machines; Gardner's patent sifting, grinding, disintegrating, and mixing machines, for mixing colours, cements, concretes, etc.; and Coleman's patent driving gear.

The company's goods have been supplied for the following buildings:—Cheltenham Hospital; Children's Home, Bolton; General Hospital, Birmingham; Union Workhouse, Croydon; Union Workhouse, Cardiff; Borough Asylum, Leicester; King's College Hospital, London; North Evington Infirmary, Leicester; County Asylum, Preston; Royal Infirmary, Manchester; Royal Infirmary, Edinburgh; Camberwell Workhouse; Western Infirmary, Glasgow; Guy's Hospital, London; University College Hospital; etc., etc.

SECTION THREE.

Bricks, Clay, and Glass Tiles, Terra-Cotta, and Roofing Materials. Asphalte and Damp-courses. Felts. Reinforced Brickwork. Marble. Stone. Mosaic, etc., etc.



"THE BUILDERS' JOURNAL" STAND MARKED THUS ✚

The following firms are noticed under this section, and their stands are shown blacked in, with numbers in white :—

104	F	Art Pavements and Decorations, Ltd. (The), p. 358.
186	K	Atlas Stone Co., Ltd. (The), p. 358.
43	C	British Stone and Marble Co., Ltd. (The), p. 358.
69	D	Brook, F. H., p. 358.
75	E	Carter and Co., p. 359.
112	G	Colthurst, Symons and Co., Ltd., p. 359.

THE ART PAVEMENTS AND DECORATIONS, LTD., 7, EMERALD STREET, THEOBALDS ROAD, LONDON, W.C.

STAND 104. ROW F.

The Art Pavement and Decorations Company's exhibit comprises five sections, and as a whole is one of unusual interest. The marble section is, perhaps, the most important of the series, and consists of a display of nearly 100 variously coloured marbles, suitable for all descriptions of decorative work. As some of these marbles are comparatively little known, architects should avail themselves of the opportunity of inspecting them. For walls and floors, the Siberian Green, which is very richly marked and exceedingly hard, is particularly well adopted.

In the mosaic section is a sample illustrating the Roman mosaic paving now being laid by the firm at the Victoria and Albert Museum from the designs of Sir Aston Webb, R.A., and should be specially noted by visitors.

Exhibits of parquetry and Armadek composition flooring, which is jointless, fireproof, and low in price, are also well worth attention.

Conspicuous among the exhibits in the tile section are the dull glazed Medmenham tiles, and a new hydraulic tile with a grooved non-slipping surface, for use in factories, swimming baths, and stairways.

The following is a list of buildings (with their architects) in which this company has executed work:—War Office, London, Sir John Taylor, K.C.B., and Clyde Young; Admiralty Buildings London, Leeming and Leeming; Imperial Institute, London, Thomas E. Colcutt; St. Thomas's Hospital, London, Percival Currey; Patent Office, London, Sir Henry Tanner; Houses of Parliament, Sir John Taylor, K.C.B.; Royal Albert Hall, London, Hunt and Steward; Royal Alexandra Hospital, Rhyl, A. Waterhouse and Sons; St. Mary's Hospital, Paddington, Sir William Emerson, etc.

THE ATLAS STONE CO., LTD., COLDHAM'S LANE, CAMBRIDGE. STAND 186. ROW K.

Artificial paving stones, at one time regarded with the intense suspicion that awaits any and every innovation, are now universally adopted. Their regularity of shape and surface, their economy in cost of production and in labour of laying, and other advantages, were obvious from the outset. The only question was, would they endure the test of time—would they wear and weather well? Time has shown that in this respect they are vastly superior to natural stone. This was long ago proved theoretically, and it has now been abundantly demonstrated in practice.

The Atlas Stone Co., Ltd., of Cambridge, have arranged a glass-covered stand showing numerous samples of their Atlas "Foothold" Paving Slabs, which are manufactured in Leicestershire granite concrete, for public footway pavings, etc.

These slabs are subjected to hydraulic pressure, and an examination of the numerous cut samples (taken from the ordinary stock of the company) shows the paving to be of fine and close textured concrete, evenly mixed and of uniform appearance.

The company exhibit a certificate of a test taken by Messrs. Kirkaldy, who, in crushing a sample of Atlas stone, certify a result of 12,970lbs. per sq. inch, equivalent to 834 tons per sq. ft.

A slab cut for a coal plate cover shows the facility with which the concrete may be tooled. Samples of the graded granite chippings and the cement used are also included in the exhibit.

Atlas stone paving has been extensively used for footways by over one hundred Borough and Urban District Councils, in London and the provinces, among which may be named the Enfield, Hamersmith, Lewisham, Wood Green, and East Ham Councils.

THE BRITISH STONE AND MARBLE CO., LTD., 11 AND 12, FINSBURY SQUARE, LONDON, E.C.

STAND 43. ROW C.

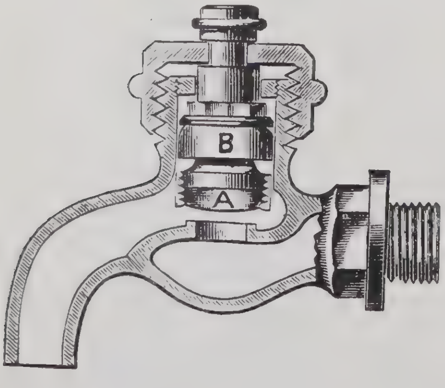
It is pointed out that this firm's exhibit—a water temple and fountain in 18th century Renaissance style—is entirely constructed of true stones, under conditions similar to natural geologic agencies, by a patented process, by means of which the geologic change extending over ages has been enormously shortened in point of time and placed under absolute control. Nothing is added to the material that is not present in the natural stone; it contains no cementing medium other than that found in the productions of nature. It should therefore be void of offence to those purists who urge a rather belated objection to artificial products, and who somewhat inconsistently make their protest in the name of art!

This exhibit is a very remarkable one, and includes specimens of various stones manufactured by this company in such close imitation of the natural materials that in formation, structure, and characteristic features, the differences are practically indistinguishable. What is perhaps more astonishing still is that Mr. J. Allen Howe, B.Sc., F.G.S., the curator of the Geological Museum, to whom a sample of reconstructed stone was submitted, has been able to report that the perfect cohesion throughout the whole mass was due to the uniformity of the crystallisation of the carbonate of lime in the matrix. Tests conducted by this gentleman with hydrochloric acid confirmed this fact.

Blocks can be produced to any depth in bed, and with an entire absence of lamination. In structure the stone is homogeneous, and contains no cementing mediums other than that found in natural stone.

Marble, free from flaws and vents, with markings and colouring true to nature, is also manufactured by the Company.

F. H. BROOK, 11, QUEEN VICTORIA STREET, LONDON, E.C. STAND 69. ROW D.



At this stand are exhibited several assortments of bricks made by various brick companies. Those of the Burlesdon Brick Co. include sand-faced hand-pressed red facings and hard red wire-cut common bricks. The red facings are remarkably free from sand flaws, and are of a deep colour, and the wire-cut are specially adapted for general building and engineering work.

The West End Brick Co.'s red wire-cut bricks—as used by the London County Council and a number of canal, gas, chemical, and sewerage works—are also shown, in addition to a selection of samples of bricks made by the Blisworth Brick Co., which latter have been extensively used by the Metropolitan Water Board and numerous public authorities, corporations and councils.

A speciality to be also seen at this stand is Garrett's "Ideal" screwdown tap, which possesses several novel features, and is deserving of the special attention of the profession. As will be noticed, the chief difference between this tap and that of the ordinary type is the absence of a screwed spindle. This tap has a smooth piston which does not turn, but is raised or lowered (quite independently of the water pressure) by the strong coarse screw of the cap. It is this cap which takes the whole of the pressure, and as it never fails to open the valve, the tap is equally advantageous for high or low pressure services of either hot or cold water.

This exhibit is sure of the suffrages of the householder, as well as those of the house builder. The average draw-off tap is a chronic nuisance because of its many infirmities, for which due allowance is not often made by the users; not the least of which is the waste it creates of water, time, and temper. The tap here shown promises a happy deliverance in both senses.

CARTER AND CO., LTD., POOLE, DORSET; 29, ALBERT EMBANKMENT, S.E.; AND 100, DEANSGATE, MANCHESTER. STAND 75. ROW E

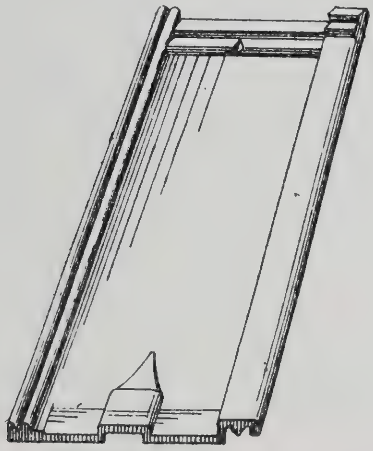
Interspersed with the many matters of purely practical interest at the exhibition, there is a goodly sprinkling of objects that are of purely artistic claims to attention. There is also the usual "third thing," the object that is a delightful blend of *utile et dolce.*

The exhibits at Messrs. Carter's stand, where they are not purely artistic, partake of this happy mixture. Their tiles for floors, walls, and fireplaces, exhibit great variety of design and colouring, but are invariably in excellent taste. They are marked, too, by a strong though by no means an aggressive individuality of style and treatment. There is, in fact, in all Messrs. Carter's productions that indefinable something that, for want of a better term, is called character.

The exhibit includes, besides all kinds of floor, wall, and fireplace tiling, many specimens of constructional faience and semi-glazed terra-cotta; of red, buff, grey, and salmon terra-cotta; of lustres, monastic and Anglo-Dutch glazed tiles; of marble and ceramic mosaics and Petropine flooring; and, above all, there are some most attractive specimens of the Carter fireplaces, such as adorn many an interior of the "stately homes" of England—and of other countries; "stately," some of them, purely by virtue of this central feature.

The following is an abbreviated list of some contracts carried out by Carter and Co., Limited, in the first quarter of 1909. The name of the architect is given in parentheses:—Royal Portsmouth Hospital (C. W. Bevis); Ipswich and East Suffolk Hospital, floor and wall tiling (H. Percy Adams); L. and S.W. Railway Servants' Orphanage, Woking (W. E. Trevena); Lunatic Asylum, Lahore, white glazed wall tiling (H.M. Secretary of State for India); Medical College, Calcutta, surgical block (H.M. Secretary of State for India).

COLTHURST, SYMONS AND CO., LTD., BRIDGWATER. STAND 112. ROW G.



If "Ballymaclinton," the ultra-Irish village at the Franco-British Exhibition, owed two-thirds of its charm to the beauty of the imported Irish colleens, the other third appears to have been indigenous to the land of the Sassenach. The reference is, of course, to the picturesque tiled roofs. Those tiles came from Bridgwater, and were supplied by Messrs. Colthurst, Symons and Co., who thus enjoyed an excellent opportunity of demonstrating beyond cavil to an enormous public the merits of their patent Acme tile.

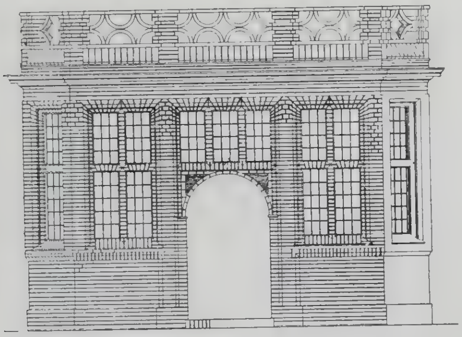
It is not surprising that our ideas upon roof coverings, as upon almost every other detail of building construction, should be undergoing revision. The slate roof, with its many undeniable merits, has many equally incontrovertible disadvantages; and it represents a somewhat primitive system. It is therefore very natural that many ingenious attempts to improve upon it have been made, with more or less success. Besides, there are circumstances in which tiles are decidedly preferable to slates; and, fortunately, in such cases, the inventor has come to the rescue with newer and better forms of this class of roof-covering.

At this stand may be seen a miscellaneous collection of clay goods, among which the patent "Acme" tile—which was used throughout the Irish Village at the Franco-British Exhibition—is deserving of special attention. It is quite a recently patented tile, and possesses the merit of being very easily laid.

The patent "Paragon" tile, of which an illustration is given, has been recently used by the Admiralty for re-roofing some barracks at Guildford.

There are various other interesting exhibits displayed at this stand, including the patent interlocking Roman tile, which has been extensively used for church and other roofs.

DANESHILL BRICKWORKS, BASINGSTOKE. STAND 32. ROW B.



STAND DESIGNED BY EDWIN L. LUTYENS, F.R.I.B.A.

Professional men will not require to be told that the brick pavilion which comprises this firm's exhibits is from the design of a capable architect. The author is Mr. E. L. Lutyens, who was the first to use the bricks made at the Daneshill Works, and whose advice in the matter of manufacture has been followed since their establishment five years ago.

As will be seen from an examination of the bricks used in the construction of the pavilion, they are entirely hand made, and in texture, colour and size suggest in an unusual degree the old bricks of the 16th century. The clay is dug many months in advance, hand-tempered (to prevent too fine a texture), and the bricks burnt in old-fashioned Scotch kilns.

The following are some of the buildings (and their architects) for which Daneshill bricks have been used: Shop, Kensington High Street, F. S. Chesterton; lodge, Sevenoaks, F. S. Chatterton; house, 51, Grosvenor Square, Messrs. Balfour and Turner; church, London, Messrs. Balfour and Turner; church, Suffolk, F. G. Eden; house, Gloucestershire, Messrs. Emden and Egan; two houses, Silchester, N. Evill; house, Teddington, A. Jessop-Hardwick; house, Berkshire, W. L. Lucas; Marsh Court, Stockbridge, E. L. Lutyens; New Place, Botley, E. L. Lutyens; Barton St. Mary, East Grinstead, E. L. Lutyens; Daneshill, Old Basing, E. L. Lutyens; garden, Suthamstead, E. L. Lutyens; Hampstead Garden City, E.L.Lutyens; Dormy House, Walton Heath, E. L. Lutyens; house, Walton Heath, E. L. Lutyens; house and park wall, Nettlebed, C. E. Mallows; house, Hampshire, Ernest Newton; house, Shrewsbury, E. Newton; Mausoleum, Paul Phipps; Harefield House, Middlesex, Paul Phipps, etc.

DAWSON AND CO., LTD., MENDIP WHARF, BATTERSEA, LONDON, S.W. STAND 39. ROW C.

Among the changes in taste of recent years no instance is more remarkable than that which has banished from favour the old-fashioned London stock-brick. There are signs, however, that architects are returning to their former appreciation of its many excellent qualities, and at this stand Messrs. Dawson exhibit various panels of brick-work executed in malms and different grades of stock stocks, which will prove of great interest to the profession.

There are numerous specialities on view at this stand, such as "Klinkerite" partition blocks, "Asbestos Cement" slates and slabs, and many novelties in sanitary appliances. Among these may be noticed five types of gullies, each possessing distinct features in design—inspection eyes, an improved rain-water shoe, etc.

In addition to the above, this firm exhibit their "Ephos" ware channel pipes and bends, which are made in a variety of patterns, and a large selection of sinks, lavatory basins, etc.

Messrs. Dawson and Co. have supplied sanitary fittings, etc., to the following:—H.M. Admiralty, H.M. Office of Works, London County Council, Metropolitan Water Board, Paddington Borough Council, Marylebone Borough Council, Wandsworth Borough Council, Fulham Borough Council, Battersea Borough Council, Lewisham Borough Council, Chelsea Borough Council, London and South-Western Railway Co., leading London contractors, St. George's Union and Infirmary, Fulham; Fulham Smallpox Hospital; numerous schools for the London School Board.

THE DUROLITE CO., 2, CHURCH ROW, LIMEHOUSE, LONDON, E. STAND 227. ROW O (ANNEXE).

The hygienic surface such as these tiles present, is an indispensable feature of modern building and decoration. Where the tiles are perfectly plain, they are goodly to look upon, because they are cleanly, and give a comfortable assurance that they harbour nothing that is injurious to health.

So strong has this predilection become, that tiles to-day are used more extensively, and for a greater variety of services, than ever before. One finds them in common use not merely in hospitals and other public institutions, but in the bathrooms and kitchens and even in other apartments of private houses.

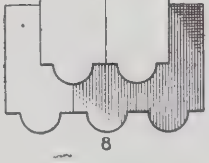
As for business premises, that tradesman is foolish who, if he deal in things that are for eating or drinking, has failed to perceive the wonderfully attractive effect of neatly tiled walls. They inspire confidence in the customer as a guarantee of cleanliness and purity.

At this stand "Durolite" opal tiles have been conveniently displayed by the Company, which has erected a wall (10ft. long by 10ft. high) whose surface is finished with white opal above, and the firm's marble tiles—in the form of a dado—below.

Special attention is directed to the patent "Grip" or "Key" backing, which, being absorbent and having a different co-efficient of expansion from the tiles, possesses a certain elasticity, and prevents them from cracking or crazing. The surface is impervious to moisture and heat, and being non-absorbent and without "surface glaze," does not gather dirt or become dingy with use.

The tiles may be had not only in white, but in various plain tints, besides in imitations of marbles and granites. Some of the decorative designs in stock are very good, and architect's own designs can be carried out if desired.

WILLIAM EXLEY AND SONS, BROSELEY, SHROPSHIRE. STAND 216. ROW N (ANNEXE).



Messrs. Exley and Sons' exhibit takes the form of a building specially designed to provide opportunities for displaying their well-known Broseley roofing tiles and vertical hanging tiles—"Coalport-Broseley" brand—both smooth-faced machine made, and genuine hand-made tiles. The application of springers, external, internal and octagonal angles, gable angle tiles, and other special forms necessary for meeting the requirements of modern roof tiling, is illustrated in a very practical manner. Among the latter should be noted one that diminishes, known as the "Tower" tile, for use on spires or other tapering roofs.

There are also selections of ridge tile finials of varied patterns, ornamental roofing tiles, plain and ornamental ridge tiles, hip-end ridge tiles, quoins for bays and tops of hips, and the ordinary forms of channel and coping bricks.

The following are a few of the buildings recently covered in with William Exley and Sons' "Coalport-Broseley" tiles; St. Andrew's Church, Worthing, Sussex; St. Ronan's College, Worthing, Sussex; Roman Catholic Cathedral, Cambridge; Holy Trinity Church, Wanstead, Essex; Chigwell Church, Woodford, Essex; Borrowash Church, near Derby; Mongewell Mansion, Wallingford, Berks.; Arthur Road Schools, Beckenham, Kent; new Railway Station, Harrow, Middlesex; Commercial Travellers' Schools, Pinner; new Railway Stations, Buenos Ayres, South America; Grange-Gorman Barracks, Dublin, Ireland; Bow Schools, Stratford, London; King's Palace, San Sebastian, Spain; Wellington College Gymnasium, Wellington, Somerset; Walmer Church, Kent; St. George's Church, Cannes, France; New Lodge, Six Mile Bottom, Cambridge; Norwich Barracks, Norwich, etc.

THE FIREPROOF PARTITION AND SPANDREL WALL CO., BANK CHAMBERS, 92, TOOLEY STREET, LONDON BRIDGE, S.E. STAND 253, ROW Q.

It will no doubt be found, on a complete survey of this Exhibition, that it affords, on the whole, the most complete exposition of reinforced concrete construction that has yet been vouchsafed to us; and the variety and ingenuity of the manifestations in this kind will surely come as a revelation to those who have not watched the movement so closely as regular readers of this journal have been enabled to do.

One of the most remarkable applications of reinforcement to brickwork is to be seen at this stand, where this Company has erected a brick wall (2¾ins. thick) which is 28ft. long and is supported at the ends only. The principle of construction involves a combination of brick, hoop-iron, and cement-mortar, framed together in such fashion as to form a solid slab. Placed about eighteen inches apart in horizontal as well as vertical directions, the hoop-irons do not penetrate or have any sort of attachment at their points of crossing.

This system has been successfully used for a variety of structures—mostly of light and temporary descriptions, and is specially adapated to garden and boundary walls, where the supporting stanchions need not be closer together than 10ft. apart.

This system of construction has been adopted in the following buildings:—Four houses at Letchworth Garden City; house at Roply, Hants; Royal Engineers' Pavilion, Aldershot; partitions for War Office at Royal Arsenal, Woolwich; partitions, etc., Weston Street, S.E.; partitions, etc., Knightrider Street, Queen Victoria Street and many other places in London and suburbs; patent walls, etc., Manchester, Mosley Hotel; boundary wallings, Edinburgh, Bromley, Fulham; partition walls, Avonside engine works, Bristol; etc.

FOREST OF DEAN STONE FIRMS, LTD. 44, HIGH STREET, BRISTOL. STANDS 267 AND 268. ROW S.

At these stands are to be seen samples of the various building and other stones which are quarried by these firms, and include the following:—

Grey and Blue Forest of Dean Stone.—These quarries are situated in the valleys of the Forest of Dean, Gloucestershire, and the stones obtained from them are used for all kinds of building, engineering, and monumental purposes. Both colours are found in the same quarries, but the blue is the harder stone.

Red Wilderness Stone.—This is only found at Mitcheldean, Gloucestershire, and is one of the best-known sandstones in the country.

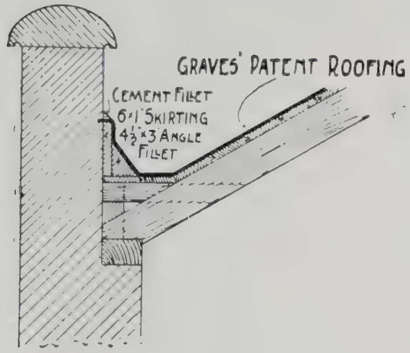
Mountcharles Stone is quarried in County Donegal, Ireland. When quarried, this stone is of a full cream colour, but after a few years' exposure it becomes white.

Nailsworth Stone.—This is a durable stone, somewhat resembling Portland.

Bristol Pennant Stone, Keinton Stone, and Porthgain Granite Macadam.—The last named is a Welsh material, much used for road-making.

The following is a list of buildings (with their architects), in which the stones mentioned have been used:—Stanhope House, Park Lane, W., Romaine-Walker and Besant; Robinson and Cleaver's new premises (back elevation), King Street, Regent Street, W., Crickmay and Sons; new shop premises, Hans Crescent, Brompton Road, S.W., R. Bennett; new bakeries, Steward Street, Brushfield Street, Bishopsgate Street, E.C., F. Adams Smith; Nugget Polish Factory, Vauxhall Street, Kennington, S.E., F. A. Powell; Littleton Bridge, Shepperton, for the Middlesex County Council, H. T. Wakelam; 18, Little Britain, Newgate Street, E.C., Rolfe and Matthews; boundary walls and piers, new "Morning Post" Homes, New Kent Road, S.E., and new shop premises for Messrs. Grose Bros., Ltd., Walworth Road, S.E., G. A. Lansdown; Lady Bruce Memorial Church, All Saints, Tooting, S.W., Temple Moore; extensions Gas Works, Croydon, Surrey, H. C. Helps; New Long Grove Asylum, Epsom, Surrey, for L.C.C., G. T. Hine; Abbey Street Dwellings, Bermondsey, for S.E. Railway Co., Humphreys-Davis and Co.; new County Court Offices, Croydon, Surrey, Sir Henry Tanner; new Public Baths, for the Camberwell Vestry, Old Kent Road, S.E., E. Harding Payne; new warehouse, Blue Anchor Lane, Bermondsey, S.E., and various other warehouses, Edward Crosse; stabling, farm buildings, cottages, etc., Tandridge Court, Oxted, Surrey, F. S. Brereton and Son; new Sessions House, Old Bailey, E.C., E. W. Mountford; alterations to St. George's Church, Borough, London, S.E.; Highways Depot, Croydon Road, Penge, S.E., H. W. Longdin; Nos. 43, 45, 47, and 49, High Road, Harlesden, N.W.

GRAVES AND CO., LTD., WATERFORD, IRELAND. STAND 191. ROW L.



Messrs. Graves and Co.'s connection with asphalte roofing dates back for nearly half-a-century, and they were the original manufacturers of it in the United Kingdom. In the early days it was known as "Danish Asphalte," because it was imported from Denmark, in which country its use for roofs of all descriptions had long been known. Experience has shown that any departure from the formulæ originally used by the Danish manufacturers, or any attempt to hasten or cheapen its production has resulted in a falling-off in quality, and it will surprise visitors to be told that it is now manufactured by the same primitive methods as it was fifty years ago, each piece being separately made by hand, and separately air-dried.

At this stand the company are exhibiting several models, one which shows a lattice girder roof covered with their patent roofing. Others illustrate a couple of flat roofs covered with two layers of the material treated with mastic between the layers, and finished with mastic composition and sand. The main points about Graves's Patent roofing are that it forms a permanent fireproof roof covering, adaptable to any pitch.

Among the exhibits are sample rolls of Graves's patent fibrous asphalte dampcourse. The following is a short list of buildings in which the company's material has been used:—Dock sheds, Canada dock, Liverpool (Mersey Docks and Harbour Board); Irish International Exhibition, 1907; new passenger station, Rosslare Harbour, G.S. and W. Railway; chemical works, The United Alkali Co.; new station at Waterford; carriage sheds, Wakefield (Lancashire and Yorkshire Railway); factory buildings, Manchester, Charles Caine, M.S.A., architect; Messrs. W. and H. Goulding, chemical works, Dublin and Cork; Glasgow International Exhibition, 1901; goods store, Liverpool, Lancashire and Yorkshire Railway; goods store, Belfast, Midland Railway; engineering shop and gas plant works, Crossley Bros., Manchester; cement store, Associated Portland Cement Co., Ltd.; copper works, J. H. Dennis and Co., Ltd., Widnes, also Bordeaux; sawmills, Messrs. Eustace and Co., Ltd., Cork; etc.

THE HAZELWOOD BRICK CO., CRANLEIGH, SURREY. STAND 1. ROW A.

The position occupied by this firm's stand at the exhibition is surely of good augury. The goods displayed on Stand 1, Row A, should certainly be A1. They appear to be quite worthy of this designation.

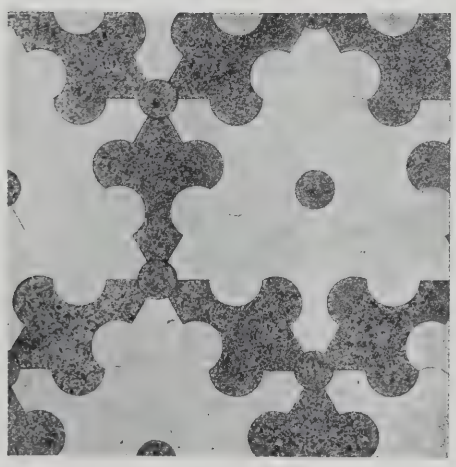
The bricks of which samples are shown consist of red, hand-moulded, sand-faced building bricks, of the "H.B.C." brand. These are of high quality, and are made in two sizes—namely, 9ins. by 4⅜ins. by 2 11-16 ins., and also 9ins. by 4⅜ins. by 2ins. They are manufactured in three different shades, and are of great durability and excellent appearance. They are in three shades—dark red, medium, and light, the last-mentioned being specially suitable for facing interiors of churches and public buildings.

There are also shown moulded bricks of various descriptions, purple stock bricks for facings, hard channelled bricks for paving stables, etc., hard wire-cut bricks for paving and engineering work; and stock bricks for ordinary purposes.

The large collection of tiles shown includes hand-made sand-faced red roofing tiles in three shades (a beautiful old-fashioned variety of the H.B.C. brand); the same with nibs; machine-made partial sand-faced tiles, in three shades, with nibs; common wire-cut tiles, ribbed; various descriptions of ornamental and ridge tiles; agricultural and socket pipes; and terra-cotta goods.

THE INDIA RUBBER, GUTTA PERCHA AND TELEGRAPH WORKS CO., LTD., 106, CANNON STREET, LONDON, E.C

STANDS 278 AND 296. WALL SPACE (ANNEXE).



This company's exhibit comprises a variety of rubber goods, such as w.c. plugs, hose, tubing, and steam packing, and more particularly a display of india rubber tiling and stair nosing. The floor of the stand is occupied by the company's new patent "Mosaic" india rubber tiling, and a part of the exhibit is designed as a bath-room, the floor of which is laid with a "Lily" design in this material, surrounded by ordinary black and white rubber octagons and square tiles. The thickness is either ⅜in. or ½in., according to the pattern selected, and the fixing is accomplished with the aid of a special cement supplied for the purpose. India rubber tiles, being noiseless and pleasant to walk on, and perfectly sanitary and waterproof are specially suitable for bath-rooms, pantries, etc. The colours extend through the whole thickness, so that the pattern remains permanent.

The following is a list of a few buildings in which this company's ordinary india rubber tiling is laid:—"Adelphi" Hotel, Liverpool; Alliance Marine and General Assurance Co., Ltd., Capel Court, London; Messrs. Barclay's Bank, Doncaster; Messrs. Beckett's Bank, York; Birkbeck Bank, London; Messrs. Brown, Shipley, and Co., 123, Pall Mall, London; "Colonial House," Liverpool; India Rubber, Gutta Percha, and Telegraph Works Co., Ltd. (warehouse), 100, Cannon Street, London, E.C.; Messrs. L. D. Nathan and Co., Auckland, New Zealand; National Provincial Bank, Liverpool; Phœnix Assurance Co.'s offices, Charing Cross, London; Royal Bank of Scotland (strong room), London; Sun Fire Insurance office, Newcastle-on-Tyne; Turkish Baths, 76, Jermyn Street, London, S.W.; "White Star Line" offices, Liverpool; Yorkshire Insurance Co.'s offices, Princes Street, London.

RICHARD JOHNSON, CLAPHAM AND MORRIS, LTD., 24 AND 26, LEVER STREET, MANCHESTER.

STAND 258. ROW R.

The reinforcement of brickwork by so simple a method as the introduction of wire mesh between the joints is the outcome of the close attention which reinforcement generally has received at the hands of constructional experts. Dating from as recently as 1906, "Monolithic Brickwork" (as the patentees name this ingenious system of construction), has already established a position for itself, but the well-known conservatism of architects needs to be overcome, if its application is to become general.

According to the results revealed after very severe tests, a very remarkable increase of both tensile and compressive strengths is developed in brickwork reinforced in this particular manner, and the outstanding advantage of the system is that any builder can apply it.

This reinforcement consists of a galvanised steel wire netting band 2ins. to 2½ins. wide, which is inserted in the mortar joints of ordinary brickwork. An ordinary brick wall reinforced in this way is capable not only of carrying itself, but of carrying a heavy superimposed load one week after it is built. It is possible to build a 9in. cavity wall in "H.B." brickwork, which is five times as strong as an ordinery 14in. wall, and, moreover, it is damp-proof. The way in which the "H.B." system of reinforced brickwork can be built into a concrete or brick column is well shown.

Internal partition walls are a great feature of the reinforced system. A 7½in. wall consisting of two "H.B." brick-on-edge walls with a 1½in. cavity, is rendered practically soundproof, and preserves an even temperature.

Johnson's reinforced concrete lattice is also well displayed, with illustrations showing some of the work carried out in Johnson's concrete lattice.

As we have recently described and illustrated this system, our readers are probably familiar with its merits. They will also have noted with interest the account of the tests that we have published in a recent issue. It is, therefore, unnecessary on the present occasion to give fuller details.

THE KLEINE PATENT FIRE-RESISTING FLOORING SYNDICATE, LTD., 133 TO 136, HIGH HOLBORN, LONDON, W.C STAND 64. ROW D.

KLEINE
PATENT FIRE RESISTING CONSTRUCTION
KLEINE
PATENT FIRE RESISTING CONSTRUCTION

While the principle of reinforcement as applied to concrete has been, and is still, engaging the attention of constructional engineers, much has been done for many years in the direction of strengthening by similar means ordinary brickwork. At this stand can be seen the particular method patented by the Kleine Syndicate, and the exhibit demonstrates that ferro-brickwork has great possibilities and advantages. It can be applied to floors, roofs, and staircases, and, in fact, every form of horizontal or sloping construction.

The essential feature of the Kleine Patents consists in constructing perfectly horizontal floors, without arch or camber, with ordinary rectangular bricks (usually hollow), which are neither keyed into each other, nor have any other peculiarities of shape. By means of thin iron tension bands, placed on edge and inserted in each joint, spans of immense strength and great width can be constructed.

The following are some of the contracts which have since been, or are about to be, carried out :—Imperial Hotel, London, Chas. Fitzroy Doll, F.R.I.B.A., 5, Southampton Street, London, W.C. ; warehouse, Hatton Garden, Niven and Wigglesworth, FF.R.I.B.A., 104, High Holborn, London, W.C. ; dwelling-house and factory, Leman Street, E., R. W. Hobden, 34, Finsbury Square, London, E.C. ; motor works, Eden Street, N.W., R. W. Hobden, 34, Finsbury Square, London, E.C. ; cabinet works, Tottenham, S. Clifford Tee, F.S.I., 50, Moorgate Street, London, E.C. ; drying kilns, Tottenham, S. Clifford Tee, F.S.I., 50, Moorgate Street, London, E.C. ; accumulator room, printing works, Wolverton, S. Clifford Tee, F.S.I., 50, Moorgate Street, London, E.C. ; factory, High Wycombe, S. Clifford Tee, F.S.I., 50, Moorgate Street, London, E.C. ; timber sheds, Kingsland, W. Stone, 2, Gt. Winchester Street, E.C

THOMAS LAWRENCE AND SONS, BRACKNELL, BERKSHIRE. STAND 223. ROW O.

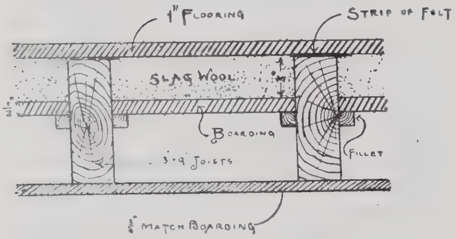
Messrs. Lawrence and Sons exhibit an entrance doorwoy (of cut and rubber brickwork), in which their T.L.B. rubber bricks show to advantage. The accurate jointing of the arch voussoirs and the good face work are especially noticeable.

This firm also exhibits a recently introduced make of sand-faced roofing tiles, produced in varied shades of red and also of dark brownish blacks. Architects desiring "ready-weathered" tiles should find the latter of interest.

T.L.B. sand-faced facing bricks are well represented. Some of these are of new shades of colour, among them being dark mixtures of colour (produced by special burning), intended to make new work look as old as possible. These bricks can be obtained of standard size and also of 2ins. thickness if required.

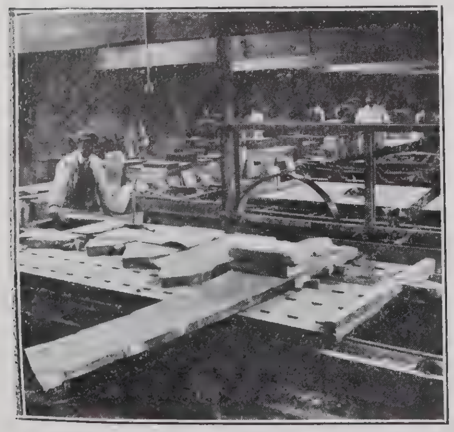
The following are some of the buildings, with their architects, in which T.L.B. bricks have been used : Police dwellings, New Street, Bishopsgate, Sydney Perks, F.R.I.B.A. ; new workhouse, Acton Lane, N.W., A. Saxon Snell, F.R.I.B.A. ; new workhouse infirmary, Plymouth, Messrs. Thornley and Rooke ; Convent of Notre Dame, Southwark, S.E., J. C. Radford ; Mortlake schools, Richmond, Messrs. Jarvis and Richards ; Surrey County Council School, Westfield, Woking, Messrs. Jarvis and Richards ; Orthopœdic Hospital, Gt. Portland Street, W., Rowland Plumbe, F.R.I.B.A. ; new house, Wimbledon Park, C. Worby Beaumont, A.R.I.B.A. ; Hackney Downs secondary school, Downs Park Road, Hackney, N.E., T. J. Bailey, F.R.I.B.A. ; new casual wards and receiving workhouse, Sheffield Street, W.C., A. A. Kekwick, M.S.A. ; Beaufoy Institute, Princes Road, Lambeth, F. A. Powell, F.R.I.B.A., F.S.I. ; central library, Hackney, H. A. Crouch, A.R.I.B.A. ; Berner's Hotel, Berner's Street, W., Messrs. Slater and Keith ; new Congregational Church, Henley-on-Thames ; etc., etc.

F. McNEILL AND CO., LAMB'S PASSAGE, BUNHILL ROW, LONDON, E.C. GROUND FLOOR, STAND 44. ROW B GALLERY FLOOR, STAND 103. ROW B.



Roofing felts, damp-proof coursing, linings for reservoirs and other objects, insulating materials, etc., are shown at these stands in considerable variety, in the form of raw materials as well as of the manufactured products of the "Lion Brand." The asphaltic roofing felt of this brand, for exterior roofing, has been supplied continuously for fifty years to British Government departments. A thinner variety is used as sarking felt ; and a special bituminous hair felt is largely used for underlining roofs, for sound-deadening in floors and thin partitions, and for lining metal buildings. The firm's inodorous felt for lining roofs, etc., is quite free from offensive smell. The patent metal asphalte damp-proof course is a combination of sheet-lead and asphalte. "Lakumen" is a damp-course manufactured from pure Trinidad bitumen, without the admixture of coal-tar or coal-tar pitch ; and "Lakumen" sheeting is much in request for lining reservoirs, filter beds, tanks, subways, and the like uses. Dry hair felt is applicable to innumerable insulating and sound-deadening services ; and the patent slag wool is a fireproof material that is much in use for the insulation of cold stores, and for covering pipes and boilers ; it has been adopted by the Admiralty and War Office. Fibrous plaster slabs ; "Combinite," a special three-ply material for flat roofs ; and "Roofitte," which is elastic and durable, are all represented at these stands. McNeill's patent slag wool has been recently supplied to the following works : Imperial Restaurant, Trocadero Restaurant, Aberdeen New Market, W. Milne's Cold Store (Glasgow), Barnsley Co-operative Society's Cold Store, Barclay' Perkins' Brewery, Ind Coope's Brewery, Bass and Co.'s Brewery, Sir W. W. Wynn's Cold Store ; etc., etc.

THE MAENOFFEREN SLATE QUARRY CO., LTD. STAND 224. ROW O.



This quarry was acquired in 1861, and is worked on the underground system (peculiar to the Festiniog district) to a maximum depth of 1,500 feet below the surface, while the workings extend horizontally for about half-a-mile.

The slates produced by this company are of a deep blue-grey, and the standard thickness is six to the inch. According to tests carried out by Mr. Bertram Blount, F.I.C., the absorption of water after saturation was found to be only .18 per cent. (by weight). A fruitful source of decomposition in slates is the presence of lime, from which—with a percentage of .24—these slates may be said to be practically free.

Maenofferen slates find a large market on the Continent—particularly in Germany, Austria and Denmark, and are also exported to the Colonies. In our own country they are used by various corporations and public bodies and the leading railway companies

The following is a list of some buildings on which Maenofferen slates have been employed : New Schools, Abercynon, South Wales ; County School, Bargoed, South Wales ; New School, Luton ; Council School, Porth, South Wales ; Council School, Trealaw, South Wales ; County School, Portmadoc ; Porth Gas Works, South Wales ; Rudmore Gas Works ; Town Hall, Copenhagen, Denmark.

The roofing slates of which this exhibit consists are the product of the company's quarries at Blaeou Festiniog, North Wales. The main part of the quarry workings are in the famous "Old Vein," and the slates with which the pavilion is covered are the best from this vein, well known to the trade as "Bert Old Vein."

H. J. AND C. MAJOR, LTD., BRIDGEWATER. STAND 110. ROW G.

This firm has long been known to the profession for its patent interlocking roof tiles, and these are here exhibited of several patterns. The great advantage of the system is that the overlapping is reduced to a minimum, and the weight per square works out less than in the case of slates or Broseley tiles. The double Roman, Welbeck, and angularly corrugated patterns have been on the market for a number of years. The firm has, however, quite recently introduced an entirely new design called the "Grecian," which presents a very neat finish not unlike the Double Roman, except that the vertical ribs are parallel and flat instead of round and tapered. In this pattern the gauge of batten is the same—15in., and 95 tiles go to the square.

The rest of the exhibit comprises samples of ordinary roofing tiles, ridges, pipes, squares, and bricks of every description, including "Bath" scouring bricks.

The following is a list of buildings in which Messrs. Major's tiles have been used: King Edward VII. Hospital, Windsor; schools, Windsor; Montague Institute, Huntingdon; Clement Talbot Automobile Works, N. Kensington; Ranelagh Club Polo Pavilion, Barnes; Workmen's Dwellings, Richmond; Mission Hall, Sunningdale; Cape Copper Works, Briton Ferry; Automobile Works, Manchester; farm and other buildings, Marquess of Salisbury's Hatfield estate; farm and other buildings, Duke of Westminster's estates; Welbeck Abbey, Duke of Portland's Pemberton estate, Manchester; Government and other buildings, South Africa; Brompton Oratory; churches, schools, and convents, all over England; Clifden and Galway Railway Station buildings, Ireland; Meat Market, Birmingham; Dairy of Royal Agricultural Society of England.

THE MANU-MARBLE CO., LTD., 73a, QUEEN VICTORIA STREET, LONDON, E.C. STAND 150. WALL SPACE.

The degree of excellence—in colour and veining—attained by the makers of this remarkable artificial marble, will surprise those who do not know of it from personal inspection. As a general rule, architects shrink from using shams or counterfeits, but this is a case where the constituent parts are identical with the natural material, and it may therefore be said to be actual marble; for though a manufactured article, the chemical composition is the same, and what is more, the markings and colours go right through it.

"Manu-Marble" has only been on the market since 1907, and has already attracted wide notice in the building world. It takes a high polish, and, it need hardly be said, is entirely free from flaws.

It should prove of great interest to architects.

The following are a few of the architects and firms who have used manu-marble:—The new St. James's Hall, Great Portland Street, London; secondary schools, Denmark Road, Gloucester, W. Wood, architect; Oakenrod schools, Rochdale, Sykes and Evans, architects; H. E. Percy, King's Road, Leytonstone, Essex, new shops; Otto Monsted, Ltd., Margarine Works, Southall, decorative work, new offices; Mattock Bros., Winkfield Road, Wood Green, London, square columns; Bird and Hudson, 27, Wellington Street, Luton, flooring and dados; R. W. Smith Saville, architect, Hawkshaw Avenue, Darwen, flooring for St. Cuthbert's Church; Holtham and Whiting, 34, York Place, Leeds, flooring; F. Mellows, Marlborough Road, Sheffield, lavatory and bath room; C. Batley, Clarendon Chambers, Watford; W. E. Putman, Town Hall, Morley, manu-marble for Secondary and Technical Schools, Morley; Parker Robinson, Greengate Bridge, Barrow-in-Furness, manu-marble for hall; the Coatestone Decoration Co., 77, Mortimer Street, Regent Street, London, manu-marble dado, etc., etc.

THOMAS MITCHELL, GUILDFORD PARK BRICKWORKS, GUILDFORD, SURREY. STAND 34. ROW B.

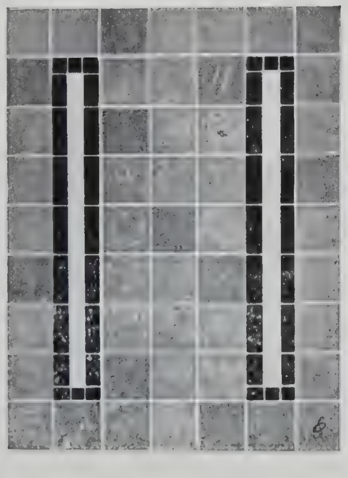
HOUSE AT WOKING. E. A. VERGE, ARCHITECT.

The growing demand for bricks and tiles which look old as soon as they leave the works has caused manufacturers to give increased attention to the production of such goods, and at this stand may be seen specimens of dark roofing tiles which are a close imitation of old ones. This firm also makes hand-made and sand-faced roofing tiles, which acquire indications of a premature age and possess quick weathering qualities. It is claimed that tiles made in this way suffer no loss as regards toughness or durability and that they do not flake—even when in very exposed situations.

Among other goods manufactured at these works may be mentioned purple facing stock bricks, as used at St. Matthew's Church, Wimbledon; wire-cut bricks, two-inch red-facing bricks, agricultural drainage pipes, etc.

The following is a list of some recent buildings (with their architects) for which bricks, etc., have been supplied:—House for Lord Colville, of Culross, Thursley, Surrey, H. Falkner (Niven, Wigglesworth, and Falkner), Farnham; Clive House, Roehampton, Surrey, C. H. B. Quennell, F.R.I.B.A., London, S.W.; St. Matthew's Church, Wimbledon, E. C. Shearman, A.R.I.B.A., London, W.; "Chantry Dene," Fort Road, Guildford, Messrs. Clemence and Moon, Guildford; "Beechmount" and "Langton," Warwicks Bench, Guildford, Messrs. Clemence and Moon, Guildford; house for Mr. Spencer Castle, Frensham, Surrey, A. J. Stedman, Farnham; house at Fort Road, Guildford, E. L. Lunn, Guildford; additions at the Royal Surrey County Hospital, Guildford, and at the Guildford Union, E. L. Lunn, Guildford; etc., etc.

THE MODERNIA PATENT GLASS TILE CO., 68, FINSBURY PAVEMENT, E.C. STAND 18. ROW B.



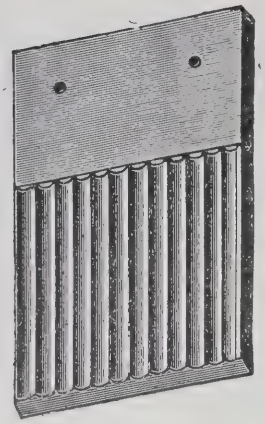
Modernia tiles are of cast glass, and are roughened at the back (by a special process) to give a good key for fixing. A point to which the attention of architects may be called is that these tiles are over ¼in. thick, and are, therefore, capable of withstanding any ordinary blow without injury. These tiles are generally 5¾in. by 5¾in., but can be made of any size, and of any shade of colour.

The public demand for glasswork decorative effect is well marked. It has probably been stimulated by certain outstanding examples of what can be achieved in this kind, as in the mosaics at St. Paul's.

Modernia tiles are rather suggestive of mosaic work, particularly in regard to texture and colour—which gives them a distinctive appearance, due in some measure to the fact that the colour goes right through. They can be employed in all cases where ordinary glazed tiles or bricks are used, and it is claimed for them that, as they are acid-proof, they are especially adapted to laboratories and certain classes of factories.

The following are a few buildings in which Modernia tiles have been fixed:—H.M. Government, Windsor Barracks; Lord Balcarres's town house; Sherburn Hospital, Sherburn, Co. Durham, J. Morson, Esq., architect, Newcastle-on-Tyne; E. Goldsmid Abrahams, Esq., "The Chestnuts," Brondesbury Park, N.W., E. A. Victor, Esq., architect, 5, Arlington Street, Piccadilly, W.; Great Northern Railway Co., King's Cross, London; The Grand Ducal Baths, Bad Nauheim; Public Swimming Baths, Strassburg; Municipal Hospital, 111, Munich; Railway Stations, Dortmund and Lubeck; Royal Cartridge Factory, Dresden; etc., etc., etc.

WATSON NELSON, LTD., NAPTON-ON-THE-HILL, NEAR RUGBY. STAND 106. ROW G.



It has been sometimes remarked that "the charm of the English village" is in great measure derived from the appearance of the thatched roofs of the cottages. Since the late Sir Benjamin Ward Richardson's rather sensational exposure of the character of the thatch, which commonly reeks with dirt and disease, the picturesqueness of the thatch makes a less potent appeal to the sensibilities than the knowledge of its inherent viciousness. But fortunately, tiles are almost equally charming, and are quite sanitary.

This exhibit consists of the several specialities made by this company, of which prominence is given to the "Windmill" brand of roofing tiles, with hips, valleys, ridges, and finials. Considerable pains have been taken in the selection for manufacture of various very useful stock shapes, which greatly assist the tiler who has awkward mitres to deal with, as in the roofs of dormers, bays, etc. There are quite a number of special forms of tiles in this section.

Attention is called to the "Fluted" faced tile, which is made with vertical channels for about two-thirds of its length, at which point they stop square, the remainder of the tile being plain. The grooves ensure the equal distribution of rain over the surface of the tile, and while driving rain is retarded by their square terminations, it is drained back by the channels.

Other exhibits include common red and pressed bricks, red adamantine and common quarries, agricultural pipes, etc.

Windmill roofing tiles have been specified for the following:—The new fire station and municipal offices, "Royal Borough of Windsor"; St. John's Church, Clevedon; new infectious hospital, Abingdon-on-Thames, Lowther and Glebe Estates, Barnes; Council Schools, Warwick and Stockton; Schools, Newbury, etc., etc.

THE NEWELLITE GLASS TILE CO., LTD., SHENTON STREET, OLD KENT ROAD, S.E. STAND 68. ROW D.

This firm is showing, in addition to numerous panels, a section of tunnel work, a bathroom, a lavatory, and a hospital ward, with fittings complete. This, as we have remarked in many similar instances, is the best possible method of exhibiting, as it shows the goods as they would appear in their actual application.

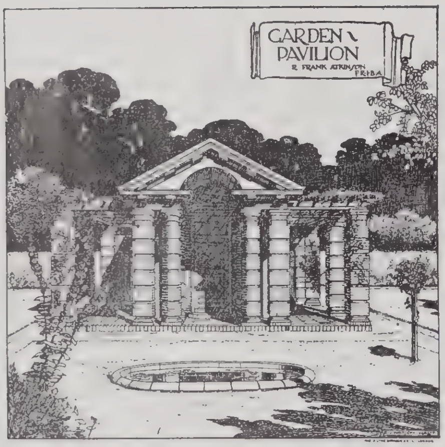
The special attention of architects interested in hospital construction is invited to the bent corner pieces, or inverts, which are excellent examples of glass bending, and admirably adapted to meet the requirements of modern sanitation. The company are making a special feature of this class of work in their present exhibition.

Attention is also called to the 4ft. 6in. section of tunnel tiling, this being a reproduction of work actually fixed, to the extent of over 10,000 super yards, in the Angel to Euston extension of the City and South London Railway. This tiling will be found, on inspection, to be as perfect as when completed two years ago.

A new feature in this exhibit is "Newoleum" flooring, which rivals—or possibly excels—any like article on the market. It is as durable and cheaper.

It is impossible to reproduce here a full list of the firm's many clients; but recent contracts include the War, India, and Home Offices; Office of Works; extension of G.P.O. at St. Martin's-le-Grand; the Borough Councils of Ilford, Leyton, and Stoke Newington; the S.W. Railway Co.; the South Metropolitan Gas Co.; etc., etc.

C. H. NORRIS, LTD., WHEATLEY CHAMBERS, PIER ROAD, ERITH. STAND 81. ROW E.



Following the precedent of 1907, Messrs. Norris have commissioned Mr. R. Frank Atkinson, F.R.I.B.A., to design their stand, and, like its predecessor, it will be remembered among the most noteworthy of the exhibits. Architects are not likely to dissociate Mr. Atkinson's Georgian pavilion from the bricks of which it is built, and from this point of view, if from no other, the enterprise of Messrs. Norris will prove a wise policy. The pavilion, or garden house, occupies a space of 25ft. by 20ft., and consists of one large square room, having a brick tiled floor and a domed plaster ceiling with cornice, all bearing that scholarly impress which characterises Mr. Atkinson's work The brick columned portico, with its copper roof, forms a very attractive approach.

The whole structure, in which Messrs. Norris's bricks have been employed, was erected in the remarkable time of 10 days by Messrs. Godson and Son, of Kilburn.

The following is a list of buildings (with their architects) in which this firm's bricks have been used:—Erith Technical Institute and Secondary School, W. Egerton, M.S.A.; Town Hall for Borough of Lambeth, Warwick and Hall, AA.R.I.A.B.; New Scotland Yard (additions to), J. Dixon Butler; house, Denbridge Road, Bickley, C. H. B. Quennell; Town Hall, Godalming, the Surveyor of Godalming; Cass Charity School, Mitre Street, Aldgate, A. W. Cooksey, A.R.I.B.A.; Haberdashers' (Aske's) School, Hampstead, Stock and Page, FF.R.I.B.A.; Elmstead Glade, Chiselhurst, Bromley Municipal Offices, 151-3, Great Portland Street, W., 11, Great Marlborough Street, W., and Laurie and McConnal's premises, Cambridge, R. Frank Atkinson, F.R.I.B.A.; Eastern Counties Convalescent Homes, Clacton, J. Douglas Mathews and Son; etc., etc.

NOSTELL BRICK AND TILE WORKS, NEAR WAKEFIELD. STAND 114. ROW G.

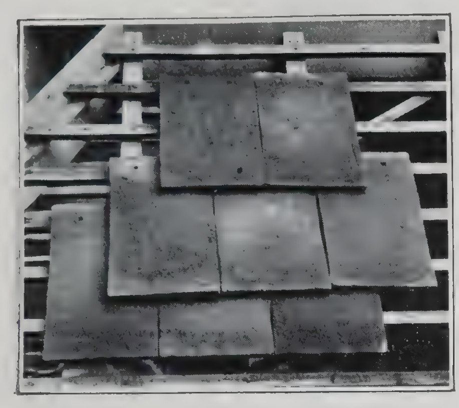
The Building Exhibition at Olympia is always peculiarly rich in displays of bricks and tiles; those elemental products of earth and fire in which this country is rich beyond all others.

The collections relating to the art and craft and business of the clayworker that are got together with such completeness time after time at the Building Exhibition, are always quite adequately representative of this great industry; and the present exhibition is by no means an exception to the rule. It does not in this respect, nor in any other, fall short of its predecessors.

There is an extraordinary diversity of interest in the plant and machinery, processes and products, of this section of the cycle of the building trades; and that such a display is highly valued, not only by those who are connected with the clayworking or the building industry, but by the outside public as well, may be inferred from the interesting fact that parties of school children have been taken to the Exhibition with the express object of watching the brickmaking machinery at work and of observing to what beautiful shapes the substance of the earth may be turned. Evidently, therefore, the clayworking exhibits may be regarded as highly educational.

This stand contains a collection that is representative of, and creditable to the best traditions of this honourable industry. The roofing tiles, plain and ornamental; the flooring tiles, adamant and tesselated; the terracotta, red, buff, grey, etc.; the glazed faience; and the red and blue bricks, make up a notable and highly attractive display of goods in which all denominations of builders are intensely interested, since they are fundamental to the business of building. They are a striking proof that burnt-earth building is in no great danger of becoming extinguished by the water-mixed or concrete method.

THOS. PASCALL AND SONS, HIGH STREET, SOUTH NORWOOD, S.E. STAND 116. ROW G.

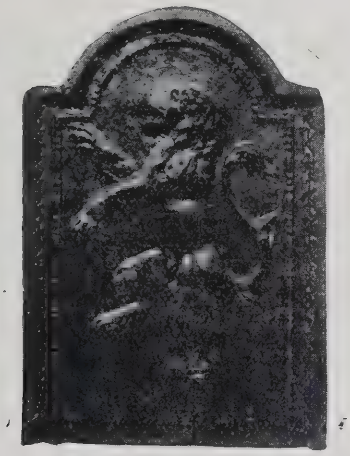


Messrs Pascall and Sons show a small building erected in their broken-colour bricks and roofed with different coloured Wrotham red and stained roofing tiles. The exhibit is worthy of special attention as an illustration of the varied colours obtained by using the bricks as they come from the kilns, instead of sorting them for uniformity of shade. It is another instance of the wisdom of following the old traditions of manufacture, and shows that it is possible to make hand-made bricks and tiles which are comparable with those in old buildings, without resorting to spurious methods of production.

At this stand may also be seen specimens of Messrs. Pascall and Sons' bonnet-shaped hip tiles (made on the lines of the old ones), with valley and ridge tiles in keeping with them, and a patent expanding ridge adjustable to any pitch or roof.

The following is a list of buildings (with their architects) in which Wrotham red bricks have been used:—St. Mary's church, Summerstown, Tooting, Godfrey Pinkerton; schools for Cooper's Company, Bow, E., T. P. Figgis; Catholic Church (South Wimbledon), Augustinian Convent (Westgate-on-Sea), schools (Sanderstead), F. A. Walters; numerous country houses, Ernest Newton; Co-operative Stores, "Woodlands," near Doncaster, Wesleyan Schools, "Woodlands," near Doncaster, P. B. Houfton; house at Bransgore (Hants), house at Spetisbury (Dorset), house at Christchurch (Hants), J. H. Brewerton; Ramsgate General Hospital, Messrs. Woodd and Ainslie; house, Las Arenas, Bilbao, Spain, Messrs. Chatterton and Couch; houses at Beckenham and Sevenoaks, Francis Hooper; Theological College, Cuddesdon, Oxon, C. Wontner Smith; "Eyhurst," Kingswood, Surrey, R. Morphew; country houses in Kent, Surrey, Sussex, Hampshire, Oxfordshire, Berkshire, and Jersey, Ernest Newton; new buildings, Hever Castle, F. L. Pearson, etc., etc.

MRS. M. L. POPHAM, JOHNBY BRICK, TILE AND POTTERY WORKS, SKELTON, PENRITH, CUMBERLAND. STAND 274. ROW T.



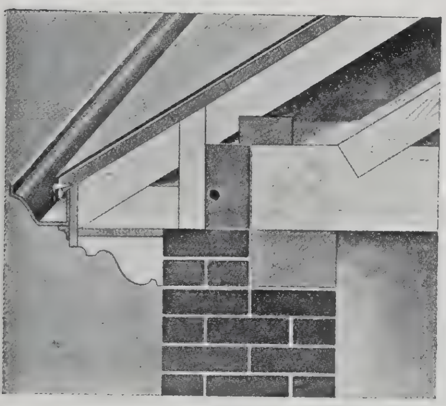
Among a variety of most artistic and interesting articles of pottery ware exhibited at this stand is a novelty in fire backs. This is made of fireclay, and in shape follows the usual cast-iron form, though there are others which do not. The heraldic lion with which this particular example is ornamented is modelled with just enough relief and breadth for the purpose it has to fulfil and fine detail which is inappropriate in such an article—has been very properly avoided.

The remainder of the exhibit consists of ornamental pots, jardinieres, bas-reliefs, etc. —adapted from old Italian and other designs. Particular note should be made of a sun-dial which was modelled—so far as the upper part is concerned—from an Arabian capital. A square pot, with low-relief panels, showing clever adaptations of Byzantine ornament, is also worthy of attention.

The manufacture of these articles only commenced a few months ago, when the brick and tile works were acquired by the present owner—a lady—whose enterprise entitles her to a wide recognition.

It is surely an industry in which a lady may reasonably hope to excel. Ladies have long distinguished themselves in the various arts and crafts; and by its plasticity the material would seem to lend itself willingly to their gentle and deft control. In all the schools of modelling to which they have been admitted, they have achieved high distinction for both industry and skill; and it is well known that much of the artistic pottery that has acquired a reputation owes the beauty of its modelling or of its decoration to the ladies who are among the most important members of the artistic staff. It is not surprising, therefore, to find a lady at the head of such an establishment as this.

THE RUBEROID CO., LTD., 81-83, KNIGHTRIDER STREET, LONDON. E.C. STAND 101. ROW F.



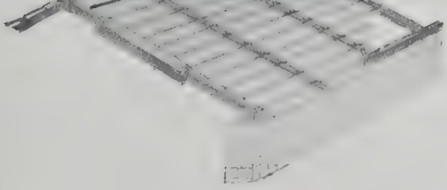
This stand consists of a pavilion with roofs of various pitches, and such constructive features as dormers, box gutters, hips, valleys, etc., in which the adaptability of Ruberoid for all ordinary roofing purposes is demonstrated. Inside the pavilion may be seen various models illustrating the application of Ruberoid as a covering for concrete roofs, wood flats, pitched roofs, and flashings to chimney stacks and wood skylights. Ruberoid was the first prepared permanent roofing material to be placed on the market, and in its composition there is no paper, tar, asphalt, rubber, or any ingredients likely to oxidize or perish; and it is elastic, light, non-porous, and is unaffected by the action of weather, or the fumes of acids or alkalies.

Three brick panels representing sections of a wall illustrate the Ruberoid system of damp-proofing walls, and as they are actual tests they should be particularly noticed by architects.

Ruberoid is made in two colours—red and green—in addition to the standard roofing, which is grey.

The following is a list of buildings (with their architects) in which Ruberoid has been used: City Chambers, Leeds, Perkins and Bulmer; Briton Ferry Chemical Works, S. Wales, J. Money Kent, A.M.I.C.E.; Children's Hospital, Gateshead, Watson and Scott; Main Hall, Royal London University, H.M. Office of Works; Goods Warehouse for the North-Eastern Railway Co., Newcastle-on-Tyne, William Bell, F.R.I.B.A.; premises for Messrs. Tom Norton, Llandrindod Wells, R. Wellings Thomas, F.R.I.B.A.; Liscard Battery, Cheshire, H.M. War Office; works for Messrs. Hayward and Co., Crewkerne, C. Benson, M.S.A.; bungalow at Shoreham, Percival T. Harrison, A.M.I.C.E.; pavilion, Greenwich Park, H.M. Office of Works; Archbishop Holgate's School, York, W. H. Brierley, F.R.I.B.A.

T. SANKEY AND SONS, LTD., ALBERT STREET WORKS, BILSTON. STAND 115. ROW G.



This exhibit illustrates in a very practical way the general utility and adaptability to every-day needs of the "Universal" roofing sheets and building material. Much has been done in the past with ordinary corrugated iron sheets, but those now under consideration, the invention of Mr. Taylor, combine so many entirely novel features and improvements, both as regards appearance and soundness of construction that they may be confidently recommended to the notice of those interested in temporary buildings. The sheets are not unlike weather boarding in appearance, presenting horizontal lines where they are stepped, at intervals of 4½ inches. A small office or garden shelter has been erected at this stand in order to illustrate the method of applying the sheets to the roof and walls. The inside is lined with this firm's embossed metal plates.

The illustration gives an idea of the appearance of the roofing.

The following is a list of buildings in which Messrs. Sankey and Sons' patent universal roofing sheets have been used:—Borstal Prison, H.M. Home Office; Cheltenham Station, G.W. Railway Co.; Snow Hill New Station, Birmingham, G.W. Railway; Tyseley Carriage Sheds, G.W. Railway Co.; Colwall Station parcels office, G.W. Rly. Co.; Newbury Westfield, station waiting-room; Oxford, Station Stores; Heysham Harbour, M. Railway Co.; Matlock Bath Station, M. Railway Co.; Hellefield Station, M. Railway Co.; goods warehouse, Shipley M. Railway Co.; engine drivers' barracks, Masboro', M. Railway Co.; verandah, Sleaford; Morecombe Station, M. Railway Co.; potato stores, West Kensington, M. Railway Co.; bungalow, Lambourne, etc., etc.

THE SEYSSEL AND METALLIC LAVA ASPHALTE CO., 42, POULTRY, LONDON, E.C. GROUND FLOOR—STAND 16 ROW A. GALLERY FLOOR—STAND 1. ROW B.

On the ground floor are to be seen models of the L.C.C. Generating Station, Greenwich—where the company laid their asphalte; a motor garage, illustrating horizontal and vertical damp courses; a tank showing asphalte lining and filletted angles, and others of brickwork construction, where vertical damp courses and metallic lawn grouting are applied.

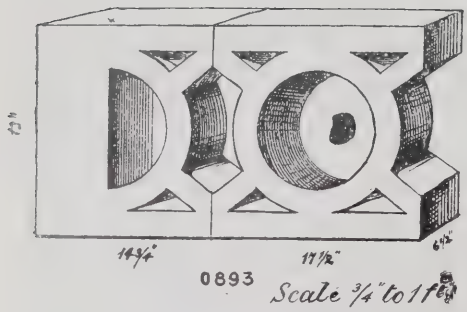
There are also several roof models showing respectively Seyssel asphalte (1in. thick) in two coats, on concrete; with canvas, on boarding; and a short length of valley gutter.

A piece of concrete roof resting on a 14in. wall and having a 9in. parapet forms a practical demonstration of the proper method of cutting the chase for the skirting. At the eaves the floating is shown set back as a rebate for the lead flashing.

In the gallery (Stand No. 1, Row B, Municipal Surveyors' Section) are shown various samples of asphalte laid on cement concrete.

The Seyssel Asphalte Co.'s contracts include work at the following:—L.C.C. Generating Station, Greenwich; London Hydraulic Power Co., Westminster; Blackfriars Bridge widening; Immingham Docks, Grimsby; Co-operative Wholesale Society, Ltd. warehouses, Leman Street and Silvertown; Albemarle Club, Dover Street, W.; Hertford College, Oxford; King's College, Cambridge; schools, Pelham Road, Wimbledon; schools, Ashford, Middlesex; John Ruskin schools, Beresford Street, S.E.; Godolphin and Latymer Schools, Hammersmith; schools, Sawbridgeworth; schools, Denby, Derbyshire; public library, Walthamstow; underground convenience, Christchurch Road, Streatham, S.W.; flats, De Walden Court, Great Portland Street, W.; "Wyphurst," Cranleigh, Surrey; "Moreton Hall," Warwickshire; flour mills, Hull; church, Brighton; electricity station, Hove.

STANLEY BROS, LTD., NUNEATON. STAND 73. ROW D.



Messrs. Stanley Bros. are giving special prominence at this stand to their glazed goods, which include bricks, terra-cotta blocks, vases, and sinks, in a variety of colours, such as white, ivory white, cream, golden brown, oak brown, light green, dark green, meadow green, holly green, mistletoe green, etc.

In order to display the colours to the best advantage, the stand is built up in tiers of fullnose bricks, each receding 2¼in., the whole supported on a base of large glazed terra-cotta blocks (known as "Grey Granite") picked out at the angles with "Golden Brown" blocks. A few glazed terra-cotta vases and sinks are also shown. Among the latter should be noted the firm's recently introduced "New Cane" shade of colour.

Messrs. Stanley Bros.' glazed bricks have been used in the following buildings:—

Schools. — London (various), Birmingham (various), Northampton, Leicester, Walsall, Derby, Nuneaton, Cambridge, Hereford, Erith, Canterbury, Coventry, Worthing, Redhill, Watford, Hitchin, Norwich, Faversham, a number of schools for Middlesex Education Committee and Gloucestershire Education Committee, etc., etc.

Theatres.—Waldorf, London; Criterion, London; The King's Hammersmith; Gaiety, London; East Ham Palace, etc.

Miscellaneous.—Digbeth Institute, Birmingham; Corn Exchange, Coventry; Masonic Hall, Chatham; extension of Merton College, Oxford; Folkestone Town Hall; Queen Anne's Chambers, Wesminster; L.C.C. Dwellings, Battersea; Harcourt House, Cavendish Square, W.C.; Moffatt Institute, Kennington; Lister Institute, Chelsea Bridge Road, S.W.

WM. THOMAS AND CO., LTD., WELLINGTON, SOMERSET. STAND 119. ROW D.

This company exhibit a complete structure, which has been designed to afford opportunities for the display of facing bricks, moulded bricks, and roofing tiles (both smooth and sandfaced). In addition, there are also numerous samples of engineering bricks, paving bricks, ridge tiles, finials, drain pipes, etc.

In regard to this firm's bricks, it may be mentioned that they are all of plastic manufacture, which imparts to them a maximum crushing strength. For this reason these bricks have been largely used by engineers during the last fifty years for such work as railways, bridges, viaducts, tunnels, sewers, barracks, reservoirs, etc. In the process of manufacture the colours are produced without the assistance of artificial colouring matter or dips of any kind, and in consequence they permeate the whole brick.

Among Messrs. Thomas and Co.'s specialities the particular attention of architects is called to the exhibit of green glazed roofing tiles.

The various works at which this firm's goods have been used would make a very long list. The following is a very small selection:—Bodmin and Dorchester prisons; County Asylum, Bodmin; Police stations at Torquay, Newton Abbot, etc. Railway construction: G.W.R., new direct route to London, via Langport and Castle Cary (several millions of bricks); Fullerton to Hurstbourne, L. and S.W.R., and on several important sections of the Great Western and other railways. Sewage works at Torquay, Teignmouth, Exeter, and many other places; waterworks, reservoirs, pumping stations, etc., at Barnstaple, Torquay, Taunton, and elsewhere. Numerous public works for local authorities such as the town councils of Brighton, Taunton, Chard, Weston-super-Mare, Teignmouth, Torquay, Newton Abbot, etc., etc.

TOWERS' ADAMANTINE CLINKER, FIRE AND ROOFING TILE CO., (A. W. SQUIRES), LITTLE BYTHAM, NEAR GRANTHAM. STAND 118. ROW G.

England is peculiarly rich in non-metallic minerals, and their manufacture into articles of utility is certainly one of our leading industries, and is perhaps the one above all others in which there is the least to dread from foreign competition. Scarcely any coal-producing district is without material of this kind; and it exists not only in great abundance, but of excellent quality, and is obtained at small cost, as a sort of by-product during the working of the coal. Nature has taken care to provide England with all the materials necessary for the potter's art. Clay, flint, kaolin, felspar, exist here in abundance, and to fire these we have mineral fuel sufficient to last for centuries, if only we are careful to exercise economy in the output.

The intimate association of clay and fire in an industrial co-partnership is strongly suggested by the exhibits on this stand.

Here are, for instance, "Adamantine" clinkers, paving bricks, and channels; fire-bricks and fire-tiles, as well as roofing tiles. The clinkers and the roofing tiles are no doubt destined to become more intimately associated with fluids than with fire, and their appearance inspires the fullest confidence in their ability to withstand the ordeal by water as successfully as the other exhibits will undergo the ordeal by fire.

The paving of stables, lairages, coach-houses, slaughter-houses, etc., etc. formerly a matter that received but little attention from the architect, is now generally specified with minute care, in order to secure results that shall not only meet the most stringent requirements of sanitary authorities but that shall also be seemly to the eye and convenient in the use. Fire-bricks are also of much wider application than heretofore; and, on the whole, this stand, although the exhibits are of a purely utilitarian order, will assuredly receive a large share of attention at an Exhibition which, while rich in art objects, is primarily concerned with business.

VULCANITE, LTD., 118, CANNON STREET, LONDON, E.C. STAND 42. ROW B.

A ROOF GARDEN. VULCANITE ROOFING UNDER.

The large wooden stand which this company has erected is covered with Patent Vulcanite Roofing, and shows the application of this well-known material to roofs of wooden construction. Access to the roof is provided by means of a spiral staircase.

On the floor level is exhibited a model illustrating in detail the method of laying. From this it will be seen to consist of six successive layers of sheet asphalte and vulcanite, alternately applied, the finished surface depending on circumstances.

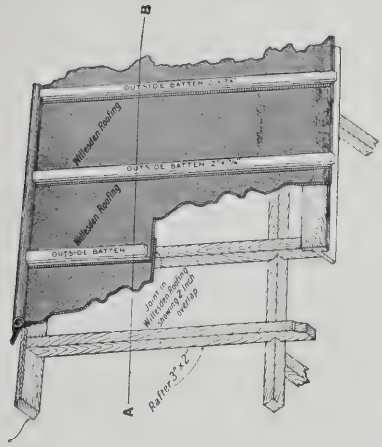
One of the most interesting uses to which this material has been put is the construction of roof tanks or reservoirs. A small pond, of wooden construction, outside the exhibit shows that it is perfectly water-tight.

"Rexilite" pure bitumen sheeting is recommended for damp courses and sloping roofs of light construction.

"Vulcanite" can also be used for damp courses.

"Vulcanite" has been used for roofing the following, among many other, buildings:—Two large bottling stores for Messrs. Read Brothers, Ltd., Highgate Road, Kentish Town, London, N.W.; gymnasium at the Convent of the Sacred Heart, Roehampton, London, S.W.; Granville Hotel, Sackville Street, Dublin; roof tank, Wood Green; the Empire Theatre of Varieties, Oldham; Greenacre Mill, Oldham; Messrs. Asa Lee and Co.'s new foundry, Oldham; The Nile Mill, Oldham; the Pier Hill Scheme Buildings, Southend-on-Sea; Victoria Hotel, Southend-on-Sea; new Capital and Counties Bank Buildings, Southend-on-Sea; the new Queen's Hotel, Westcliff-on-Sea; the North Euston Hotel, Fleetwood; seventeen roofs and large water tank on new Mater Infirmorum Hospital, Belfast, etc., etc.

THE WILLESDEN PAPER AND CANVAS WORKS, LTD., WILLESDEN JUNCTION, LONDON, N.W. STAND 45. ROW C.



At the sides of this stand, panels showing the underlining and roofing paper, of which this Company makes a speciality, are exhibited. Facing these are others displaying roofing canvas, etc.

There is also on view a set of very interesting models illustrating the application of underlining to roofs, both on rafters and on boarding. The Willesden underlining paper is no longer a novelty, and will be familiar to most architects.

It is made from the best material obtainable, and subjected to a process which impregnates it with a copper filling treated with ammonia, which virtually changes the paper into thin sheets of metal, and imparts to it waterproof and rot-proof qualities.

Attention is directed to another series of models exhibited at this stand. These are of tents of various type—one in particular having a caravan extension.

The following is a list of buildings (with their architects) where this Company's specialities have been used:—Hydro Hotel, Eastbourne, F. G. Cooke; Fenton Free Library, Staffs., F. B. Lawson; laundry and motor garage, Llandudno, G. A. Humphreys, F.R.I.B.A.; gas offices, Bristol, Venn Gough; new Wesleyan Chapel, Albert Road, Penarth, H. G. Bodgen; Grammar School, Hull, J. Hirst; St. Ninian's parish church, Stirling, Messrs. Walker M'Luckie; Sandford Paper Mills, near Oxford, J. R. Wilkin; new school, St. Annes-on-Sea, W. Scott; Dr. Coulter, Highfield Hall, St. Albans, F. W. Kenner Tarte; new infants' school, Walkergate, Beverley, Messrs. Howe and Foley; Warwick Girls' Reformatory, Knowle Hill, Kenilworth, M. C. Armstrong; private house, Ferndown, Wimborne, T. Stevens; new rectory, Buckland St. Mary, Somerset, A. C. Martin; Rt. Hon. Lord Llangattoch's Estate, Sir Aston Webb; etc., etc.

G. WOOLLISCROFT AND SON, LTD., HANLEY, STAFFS.

STAND 219. ROW N.

Constructional faience, terra-cotta, red and blue goods, and tiles of every description are represented at this stand, in the construction of which a varied assortment is displayed.

To the left of the entrance doorway is a scheme of faience decoration in carrara glazes; the entrance being of constructional faience. In the passage that divides the stand is a collection of modern fireplaces, including those known as the Glow, Quadrate, and Downdraught, which lend themselves to many styles of artistic treatment.

On the floors are specimens of tesselated and ironstone adamantine tiles in a choice assortment of designs.

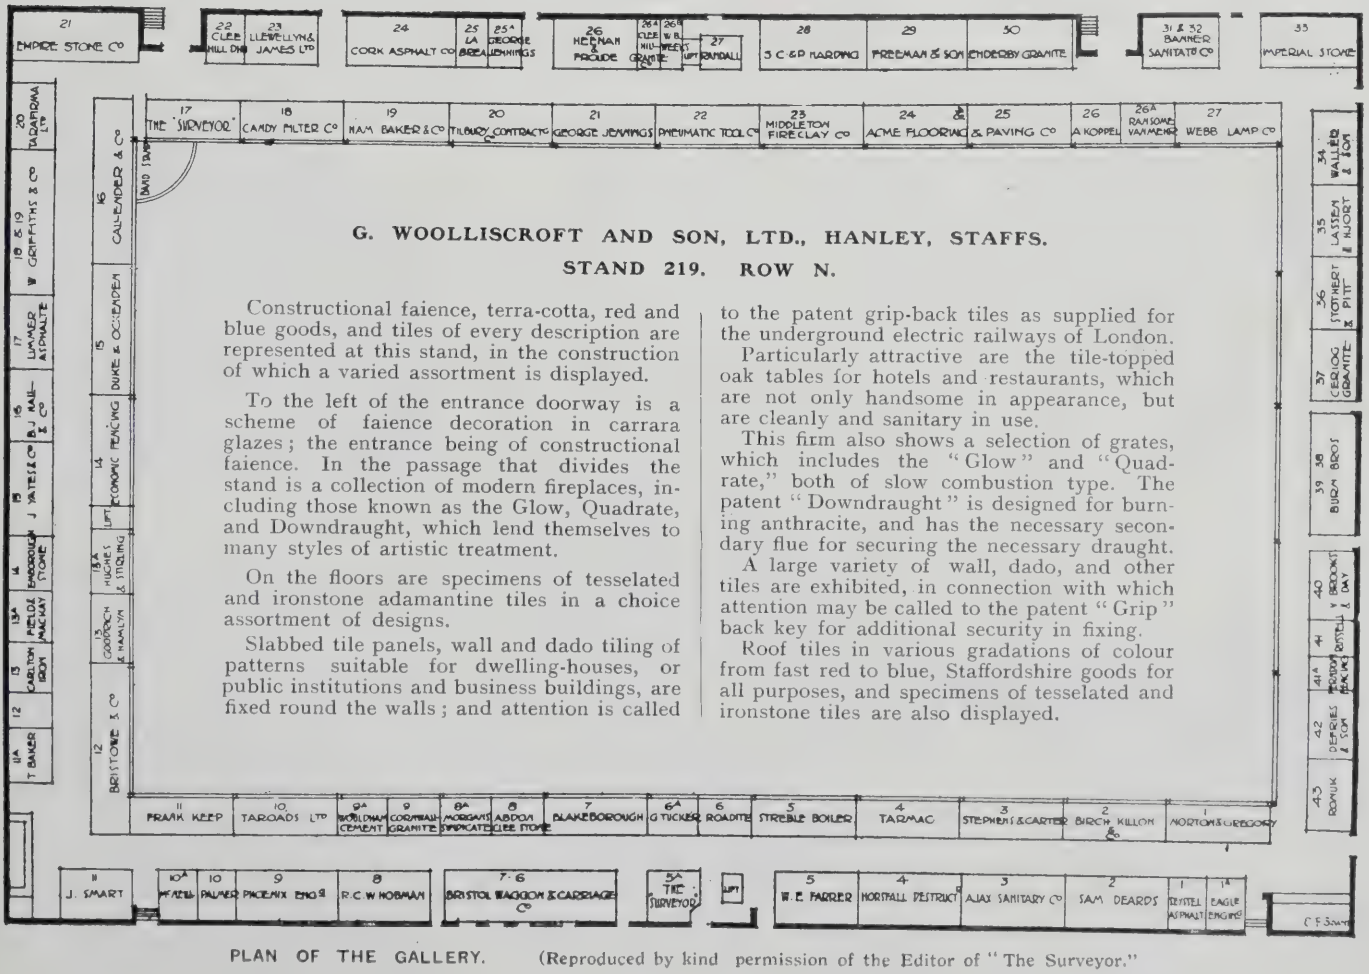
Slabbed tile panels, wall and dado tiling of patterns suitable for dwelling-houses, or public institutions and business buildings, are fixed round the walls; and attention is called to the patent grip-back tiles as supplied for the underground electric railways of London.

Particularly attractive are the tile-topped oak tables for hotels and restaurants, which are not only handsome in appearance, but are cleanly and sanitary in use.

This firm also shows a selection of grates, which includes the "Glow" and "Quadrate," both of slow combustion type. The patent "Downdraught" is designed for burning anthracite, and has the necessary secondary flue for securing the necessary draught.

A large variety of wall, dado, and other tiles are exhibited, in connection with which attention may be called to the patent "Grip" back key for additional security in fixing.

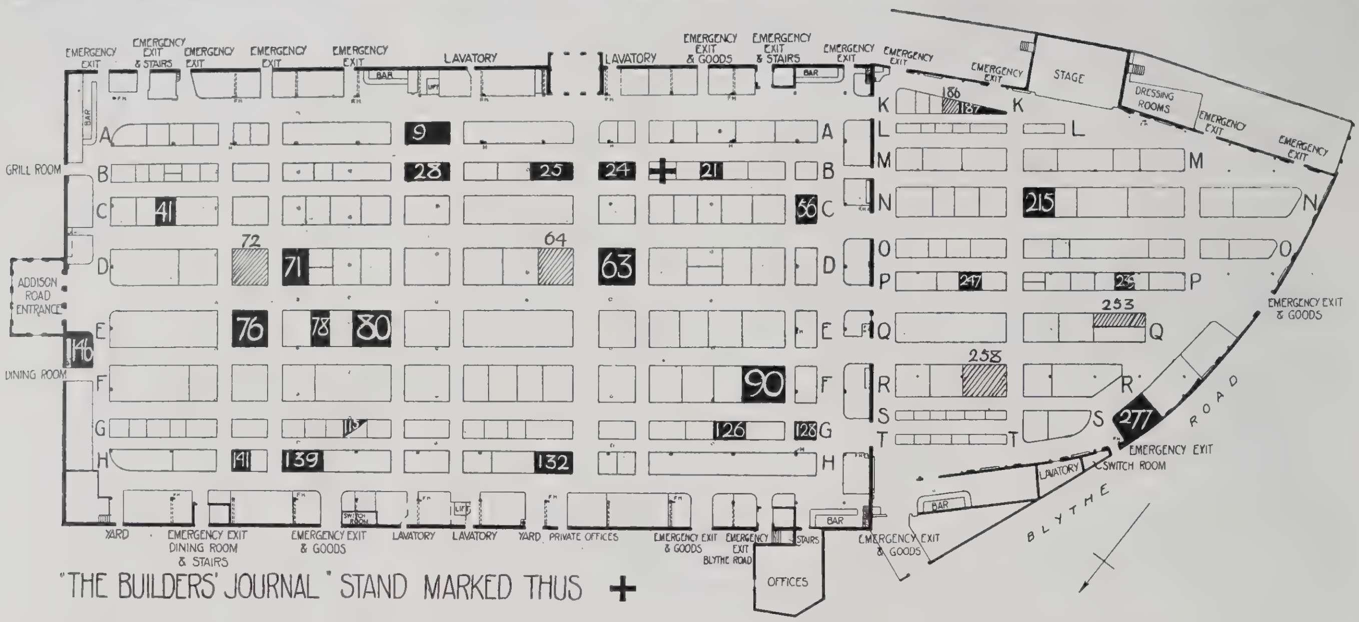
Roof tiles in various gradations of colour from fast red to blue, Staffordshire goods for all purposes, and specimens of tesselated and ironstone tiles are also displayed.



PLAN OF THE GALLERY. (Reproduced by kind permission of the Editor of "The Surveyor."

SECTION FOUR.

Cement. Plaster. Concrete. Reinforced Concrete. Reinforcements. Fire-Resisting Construction.



following firms are noticed under this section, and their stands are shown blacked in, with numbers in white :—

41	C	Armoured Tubular Flooring Co., Ltd., p. 368.
63	D	Associated Portland Cement Manufacturers (1900), Ltd., p. 369.
128	G	Acton Patent Concrete Partition Co. (1909), Ltd., p. 369.
215	N	British Uralite Co. (1900), Ltd., p. 369.
126	G	Bellman, Ivey and Carter, Ltd., p. 369.
21	B	Clark and Co., p. 370.
239	P	Coignet, Edmond, Ltd., p. 370.
132	H	Cullum, Horace W., and Co., p. 370.
139	H	Daymond, John, and Son, p. 370.
76	E	Expanded Metal Co., Ltd. (The), p 371.
146	Wa Space	Fawcett, Mark, and Co., p. 371.
25	B	Granite Silicon Plaster Co., Ltd., p. 371.
277	Wall Space Annexe	Gypsum Mines, Ltd., p. 371.
247	P	Gardel, Ltd., p. 372.
78	E	Jones, Fredk., and Co., p. 372.
71	D	King, J. A., and Co., p. 372.
56	C	Lewis Construction Co., Ltd., p. 372.
9	A	Machin and Koenig and Speaker, G.R. & Co., p. 37
24	B	Patent Indented Steel Bar Co., Ltd., p. 373.
141	H	Somerville, D. G., and Co., p. 373.
187	K	Saxon Portland Cement Co., Ltd., p. 373.
115	G	Sideolith, p. 374.
28	B	Tozer, James H., and Son, p. 374.
80	E	Trussed Concrete Steel Co., Ltd., p. 374.
9A Bay	(Gallery)	Wouldham Cement Co., Ltd., p. 374.

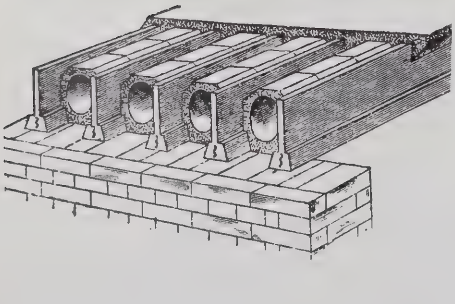
REFERENCES.

The following firms are noticed in other sections, but are showing exhibits connected with this one. Their stands are indicated by hatching :—

186	K	Atlas Stone Co., Ltd., (The), p. 358.
72	D	Emdeca Sanitary and Artistic Metal Decoration Co., Ltd., (Steleonite Stamped Steel Ceilings).
253	Q	Fireproof Partition and Spandrel Wall Co., Ltd., (Brickwork Reinforcement), p. 360.
258	R	Johnson, Richard Clapham and Morris, Ltd., (Brickwork Reinforcement), p. 361.
64	D	Kleine Patent Fire-resisting Flooring Syndicate, Ltd., (Fire Resisting Floors), p. 362.

THE ARMOURED TUBULAR FLOORING CO., LTD., 53, VICTORIA STREET, WESTMINSTER, LONDON, S.W.

STAND 41. ROW C.



This Company exhibit a strip of reinforced concrete fire-proof flooring constructed without centreing, on their armoured tubular system. The floor consists of concrete webs fixed 10in. centres (each reinforced at its haunched base with a corrugated steel bar) and concrete tubes in short lengths, supported between them. The whole structure is then finished with a thin layer of concrete. In the specimen on view, an opening has been left to illustrate the method used in trimming for stairs, lifts, skylights, etc., and the upper side of the floor shows some of the various finishes which may be applied. The soffit has been partly plastered, and gas pipes and electric wires have been run through the hollow tubes to demonstrate the facilities afforded. The various parts necessary for the construction of this floor are separately shown, and include standard sizes of webs, the concrete tubes, and the steel reinforcement bars.

The following is a list of buildings (with their architects) where the Company's system of floor construction has been adopted: Secondary schools, Sowerby Bridge, Yorks, architects, Longbottom and Culpan; St. Luke's School, Chelsea, London, architect, W. H. Hobday, A.R.I.B.A.; Forster Green Hospital for Consumptives, Belfast, architect, V. Craig, F.R.B.A.; Grammar Schools, Yorks; Albert Foundry, Belfast, for James Mackie and Son; boot factory, Bromsgrove, Worcester, architect, Alex. Anderson, A.R.I.B.A.; White Steam Car Co.'s Motor 'Bus Factory, Camden Town, architect, L. V. Hunt, F.R.I.B.A.; Humber Motor and Cycle Works, Coventry, architect, W. H. Hattrell; Whiteabbey Flax Spinning Mills, Belfast; shops, Middleton, Manchester, architects, Edgar Wood and Sellars; Church Institute, Wrexham, Cheshire, architects, Prothero, Philpott, and Barnard; etc., etc.

THE ASSOCIATED PORTLAND CEMENT MANUFACTURERS (1900), LTD., PORTLAND HOUSE, LLOYD'S AVENUE LONDON, E.C STAND 63. ROW D.

Visitors may learn a good deal at this stand of the manufacture, testing, and uses of Portland cement, and examine the very representative specimens of the upper chalk formation and clays obtained from the estuary of the River Medway, and from the Company's own deposits in Kent. Samples of slurry—the raw materials mechanically mixed in definite proportions—and a large selection of briquettes of various ages, to be tested for tensile strength during the exhibition, are also shown.

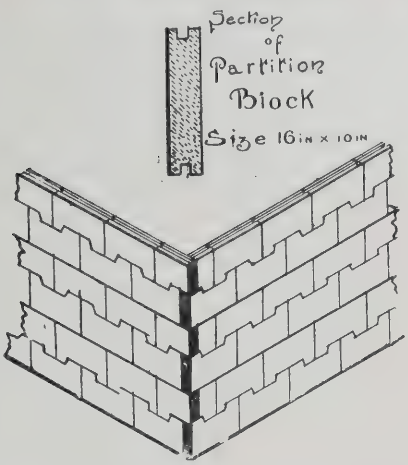
Crushing tests of $2\frac{3}{4}$ in. cubes of neat Portland cement, and a mixture of 3 of standard sand to 1 of Portland cement, and aggregates of various descriptions will also be made by those in charge of the stand.

A very fully illustrated handbook entitled "Everyday Uses of Portland Cement," which will be found of use to architects, is on sale, and some photographs of constructional works where the Company's brands of cement have been used are hung on the walls.

This volume must by no means be classed with the merely advertising "literature" which naturally abounds at an exhibition. It is a really valuable and instructive manual.

The following are some recent works in which A.P.C.M. brands of Portland cement have been used:—Belfast graving dock, Swansea new docks, Southampton dock, Methil docks, Avonmouth docks, Stalybridge docks, Garston; Bradford waterworks, Pateley Bridge; Monterey (Mexico) waterworks, Mexico City waterworks, Derwent Valley water board works, Molesey reservoir, new G.P.O. buildings, Birmingham new post office, Birmingham extension to Council House, Selfridge's Stores, British Aluminium Company's Works, Kinlochleven; new Wesleyan Hall, Westminster; new King's College hospital, Norwood carsheds, G.N.R. new sheds, Doncaster; etc., etc.

ACTON PATENT CONCRETE PARTITION CO. (1909), LTD., 63, CORNHILL, E.C. STAND 128. ROW G.



The unit of the Acton patent concrete partition is a Portland cement concrete slab, grooved for jointing. Slabs of 2ins., 2½ins., 3ins., and 4ins. in thickness are kept in stock, and these can be easily and rapidly erected into partitions of any required height and length, at a cost fairly comparable with that of ordinary plaster partitions. The advantages of the Acton patent partition, however, as compared with plaster work, are instantly manifest, the former being infinitely more strong and durable, incomparably more fire-resisting, and very much easier to erect. Besides the joint formed by ordinary cement mortar in the groove, a locking joint is ensured at every second course, the slabs being so shaped as to give a projection and recess joint that renders the partition sound, solid, and rigid.

The partition is sound-proof as well as fire-resisting, and their natural surface affords a good key for plastering, tiling, or mosaic work; and as nails can be driven into the slabs, no plugging is required.

Specimens of the Acton fireproof, sanitary, jointless flooring are also shown.

The firm's materials have been used to the order of H.M. Government for barracks at Gibraltar, Aldershot, Woolwich, Chelsea, Wellington, Knightsbridge, Bulford, Tidworth, Colchester, Chatham, Hamilton, Weedon, etc.; for hutments at Borden, etc. They have been used in many hospitals, including the Queen Alexandra Hospital, Aldershot, Shorncliffe, Netley, Woolwich, etc.; H.R.H. Princess Christian Victor's Nursing Home, Windsor, etc.; and at Guy's, Bristol (Oatley and Lawrence); in the Peabody Trust Dwellings, Herne Hill, Tottenham; in flats at Kensington (Silver Street); Camberwell (Woodroffe), etc.; in city offices at Friar's House, New Broad Street, and Portland House, Lloyd's Avenue (Hesketh and Stokes), etc.

THE BRITISH URALITE CO. (1908), LTD. LONDON OFFICE, 16, ST. HELEN'S PLACE, E.C. WORKS, HIGHAM, NEAR ROCHESTER, KENT. STAND 215. ROW N (ANNEXE).

The British "Uralite" Co. exhibits a building (20ft. by 16ft.) in imitation of half-timbered work, the contrasts being obtained by narrow strips of "Asbestone" fixed at intervals on the surface of the flat "Asbestone" sheets forming the walls. It is intended to show the adaptability of the company's manufactures to the construction of bungalows, cottages, etc.

For buildings of this type that are situated in remote districts, "Uralite" and "Asbestone" offer many important advantages, particularly with regard to portability, ease of construction, and fire-resistance.

The walls are of wood framing covered with "Asbestone" sheets (6ft. by 3ft.). One portion is left with a plain flat surface inside, and the other is panelled out with mouldings. The ceilings are of "Uralite" sheets, fixed in one case directly beneath the ceiling joists, and in the other just above them. The roof is of "Asbestone" diagonal tiles on battens, except the dormer, which is covered with "Asbestone" slates.

Asbestone and Uralite have been fully described in this journal, and readers will be glad of this opportunity of verifying by personal inspection what has been stated with respect to these materials.

"Uralite" sheets are being used in the following buildings and works: New Naval Base, Rosyth, for the Admiralty; Covent Garden Theatre, for E. O. Sachs (architect); Central Argentine Railway; Goole Tillage Company; for a factory in Yorkshire; for a mill at Port Ellesmere; Bombay, Baroda Railway; for a flour mill at Seacombe, Cheshire; for a motor garage in Egypt; for Grimsby Infirmary; lining a malt kiln at Ipswich; Great Western Railway, for Customs House at Fishguard; South Eastern Railway, for station work; ceiling a laundry in the North of London.

BELLMAN, IVEY AND CARTER, LTD., LINHOPE STREET, DORSET SQUARE, LONDON, N.W. STAND 126. ROW G.

A pair of Sienna columns, supporting an entablature, which were shown at the International Exhibition of 1862, where they gained a prize medal; and four large slabs which were at the Great International Exhibition of 1851, have more than the interest of mere relics or curios. They show in the most convincing manner possible the durability of the material of which they are made, and its lasting colour and polish, after the lapse of forty-seven and fifty-eight years respectively.

This material is Scagliola marble. Scagliola represents an old Italian process, which, revived in the sixteenth century by Guido Sassi, was largely used by the Florentines in some of their best works, and was introduced into this country about 1750 by Mr. J. Wyatt. It can be applied to all kinds of interior decoration where marble would be used, and can be turned, moulded, or cast to any shape or design. It is particularly useful for masking iron or brick cores. About sixty varieties of beautiful marbles are imitated, and further colours and figures can be produced on demand, at one-third to half the price of the marble.

The following are a very few of the mansions at which the firm has executed Scagliola work. (For the almost innumerable important buildings of other descriptions, we must refer the reader to the firm's pamphlet). The name in parentheses is that of the architect:—Albert Gate Mansions, S.W. (A. Ardron); Bantry House, Bantry Bay (for the Earl of Bantry); Bridgewater House (J. Fish); Castle, Mallwood (Paxton H. Watson); Enville Hall, Stourbridge (for the Earl of Stamford and Warrington) (the late T. Smith); Lansdowne House, Berkeley Square (for the Marquess of Lansdowne) (C. O. Parnell); Lampton Castle, Durham (for the Earl of Durham); etc. etc.

CLARK AND CO., 32a, WESTMINSTER PALACE GARDENS, ARTILLERY ROW, WESTMINSTER, LONDON, S.W. STAND 21. ROW B.

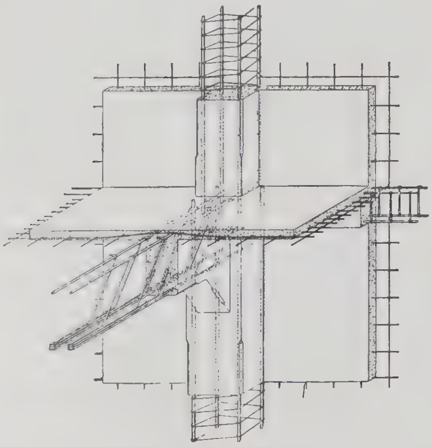
"Xelite" plaster is here exhibited in a stand erected from the designs of Mr. James Scott, A.R.I.B.A., where its general appearance and surface qualities may be studied with advantage.

It is a substitute for Keene's, or Parian, cement (at very much less cost), though having slower setting qualities. "Xelite" may be used for both rendering and finishing, and has been largely employed on various classes of buildings, such as hospitals, schools, libraries, etc.

The exhibition stand is constructed of Messrs. Clark's 3 in. finished fire-resisting partitions, of which this firm makes a speciality.

The following is a list of some of the buildings (with their architects) for which "Xelite" plaster has been used: Offices for Messrs. Blundell Spence and Co., Hull, B. S. Jacobs, F.R.I.B.A.; offices, Mayfair, Belfast, Blackwood and Jury, M.R.I.A.I.; post office, West Smithfield, H.M. Office of Works; warehouse, Belfast, W. J. Gilliland, M.R.I.B.A.; offices, Lowgate, Hull, B. S. Jacobs, F.R.I.B.A.; Shire Hall, Norwich, E. J. Tench, A.R.I.B.A.; East Riding County Council Offices, Beverley, B. S. Jacobs, F.R.I.B.A.; Chamber of Commerce, Hull, B. S. Jacobs, F.R.I.B.A.; Knightsbridge Barracks, H.M. War Department; Windsor Barracks, H.M. War Department; Richmond Barracks, Yorks, H.M. War Department; Public Library (West End) Reading, F. W. Albury, F.R.I.B.A.; Saville Street Cafe, Hull, Runton and Barry, A.R.I.B.A.; Church of the Christian Martyrs, Manchester, F. H. Oldham, F.R.I.B.A.; Wesleyan Institute and Schools, Hartlepool, Barnes and Burton, A.R.I.B.A.; F. R. Benson and Co.'s Bank, London, W. E. Clifton, F.R.I.B.A.; West Smithfield Post Office, etc., etc.

EDMOND COIGNET, LTD., 20, VICTORIA STREET, LONDON, S.W. STAND 239. ROW F.

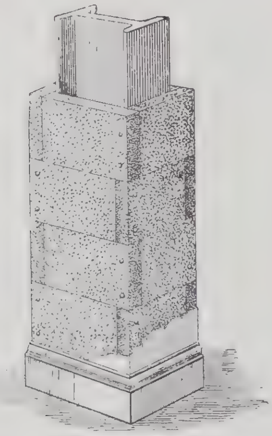


There are several very interesting models at this stand, which show the various features of the armouring employed in the Coignet system. One of these illustrates the construction of posts, beams, floors, and wall panels, and will well repay examination. Other models represent the Coignet trussed beam (used for heavy vibratory loads), an ordinary beam, and a post with footing attached. Perhaps the most interesting model is that of the Coignet pile, a part of which has been purposely stripped of concrete to show the end of the reinforcement.

On the walls of the stand are hung some photographs, among them being a general view of the Government buildings in Jamaica, which are being carried out on the Coignet system. There are also several good photographs of the new Western District Post Office in Wimpole Street, W., and the new generating station foundations at Dundee.

The following is a list of recent works in course of erection since publication of the catalogue:—New Government Buildings, Jamaica, Nicholson and Corlette, architects; Post Office, Lombard Street, H.M. Office of Works, Sir H. Tanner, architect; boiler foundations, H.M. India Office; wharf, Portslade, Sussex; jetty in the Camber, Portland, H.M. Admiralty; piling at Norwich, A. E. Collins, city engineer; tank for Paper Pulp Co., West Hartlepool; floors and swimming bath to Yeadon and Guiseley Schools, York, Mr. Broadbent, architect; floors to shops, etc., West Bar, Boar Lane, Leeds, Perkin and Bulmer, architects; floor to Blakey's premises, Leeds; footbridge and Coal Store, Erith, Scott and Fraser, architects; additions to warehouse and business premises, 24, Paternoster Square, H. Saul, A.R.I.B.A., architect; Soap Works at Chiswick, Scot and Fraser, architects; etc.

HORACE W. CULLUM AND CO., CRAVEN HOUSE, KINGSWAY, HIGH HOLBORN, LONDON, W.C. STAND 132. ROW H.



STANCHION COVERING.
